Dictionary of Arts, Sciences, &c.

C.

C A A

C THE third letter, and second consonant, of the alphabet, is pronounced like *k* before the vowels *a*, *o*, and *u*; but like *s* before *e*, *i*, and *y*.

As an abbreviation, C stands for Caius, Carolus, Caesar, *condemno*, &c. and CC for *consulibus*.

As a numeral, C signifies 100, CC 200, &c.

C, in music, placed after the cliff, intimates that the music is in common time, which is either quick or slow, as it is joined with allegro or adagio; if alone, it is usually adagio. If the C be crolled or turned, the first requires the air to be played quick, and the last very quick.

CAA-APIA, in botany, the name of a Brazilian plant, described by Marcgrave, Piso, and others; the root of which so much resembles the ipecacuanha in its virtues, that some have erroneously called it by the same name. It is an astringent and emetic as the ipecacuanha; but it possesses both these qualities in a much weaker degree, and is therefore necessarily given in a larger dose, a whole dram being the quantity commonly given at once. The Brazilians bruise the whole plant, and express the juice, which they take internally, and also apply it externally to wounds made by poisoned arrows and by the bites of serpents. Some have supposed the root of this plant to be the white ipecacuanha; but this is an error, that being little different from the grey.

CAABA, or CAABAH, properly signifies a square stone building; but is particularly applied by the Mahometans to the temple of Mecca, built, as they pretend, by Abraham and Ishmael his son.

Before the time of Mahomet, this temple was a place of worship for the idolatrous Arabs, and is said to have contained no less than 360 different images, equalling in number the days of the Arabian year. They were all destroyed by Mahomet, who sanctified the Caaba, and appointed it to be the chief place of worship for all true believers. The temple is in length, from north to south, about 24 cubits; its breadth from east to west, is 23; and its height, 27. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of the door. In the corner next this door is the *black stone*, so much celebrated among the Mahometans. On the north side of the caaba, within a semicircular inclosure 50 cubits long, lies the *white stone*, said to be the sepulchre of Ishmael, which receives the rain-water from the caaba

C A A

by a spout formerly of wood, but now of gold. The black stone, according to the Mahometans, was brought down from heaven by Gabriel at the creation of the world; and originally of a white colour; but contracted the blackness that now appears on it, from the guilt of those sins committed by the sons of men. It is set in silver, and fixed in the south-east corner of the caaba, looking towards Bafra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the *right-hand of God*. Its blackness, which is only superficial, is probably owing to the kisses and touches of so many people. After the Karmatians had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it; but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it 22 years.

The double roof of the caaba is supported within by three octagonal pillars of aloes-wood; between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and was formerly sent by the khalifs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The caaba, at some distance, is almost surrounded by a circular inclosure of pillars, joined towards the bottom by a low balustrade, and towards the top by bars of silver. Just without this inner inclosure, on the south, north, and west sides of the caaba, are three buildings, which are the oratories or places where three of the orthodox sects assemble to perform their devotions. Towards the south-east stands an edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the *hemicycle*, or *cupola of Judea*: but whether or not any remains of that are now to be seen, is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. At a small distance from the caaba, on the east side, is the *station* or *place of Abraham*; where is another stone much respected by the Mahometans; and where they pretend to shew the footsteps of the patriarch, telling us he stood on it when he built the caaba. Here the fourth feet

Caaba.

of Arabs, viz. that of Al Shafei, assemble for religious purposes.

The square colonnade, or great piazza, that at a considerable distance incloses these buildings, consists, according to Al Jannabi, of 448 pillars, and has no less than 38 gates. Mr Sale compares this piazza to that of the royal exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or steeples, with double galleries, and adorned with gilded spires and crescents after the Turkish manner, as are also the cupolas which cover the piazza and other buildings. Between the columns of both inclosures hang a great number of lamps, which are constantly lighted at night. The first foundations of this second inclosure were laid by Omar the second khalif, who built no more than a low wall, to prevent the court of the casba from being incroached upon by private buildings; but by the liberality of succeeding princes, the whole has been raised to that state of magnificence in which it appears at present.

This temple enjoys the privilege of an asylum for all sorts of criminals; but it is most remarkable for the pilgrimages made to it by the devout muslulmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the sight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

CAAMINI, in botany, a name given by the Spaniards and others to the finest sort of Paraguayan tea. It is the leaf of a shrub which grows on the mountains of Maracaya, and is used in Chili and Peru as the tea is with us. The mountains where this shrub grows naturally are far from the inhabited parts of Paraguay; but the people of the place know so well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together; leaving their country in the mean time exposed to the insults of their enemies, and many of themselves perishing by fatigue. To avoid these inconveniences, they have of late planted these trees about their habitations; but the leaves of these cultivated ones have not the fine flavour of those that grow wild. The king of Spain has permitted the Indians of Paraguay to bring to the town of Saintfoy 12,000 arrobes of the leaves of this tree every year, but they are not able to procure so much of the wild leaves annually: about half the quantity is the utmost they bring of this: the other half is made up of the leaves of the trees in their own plantations; and this sells at a lower price, and is called *pabos*. The arrobe is about 25 pound weight; the general price is four piastras; and the money is always divided equally among the people of the colony.

CAANA, or KAANA, a town in Upper Egypt, seated on the eastern banks of the river Nile, from whence they carry corn and pulse for the supply of Mecca in Arabia. E. Long. 32. 23. N. Lat. 24. 30. Here are several monuments of antiquity yet remaining, adorned with hieroglyphics.

CAB, an Hebrew dry measure, being the sixth part of a seah or satum, and the 18th part of an ephah. A cab contained 2½ pints of our corn-measure: a quarter

cab was the measure of dove's dung, or more properly a sort of chick-pease called by this name, which was sold at Samaria, during the siege of that city, for five shekels.

CABAL, an apt name currently given to the infamous ministry of Charles II. composed of five persons, Clifford, Ashley, Buckingham, Arlington, and Lauderdale; the first letters of whose names, in this order, furnished the appellation by which they were distinguished.

CABALIST, in French commerce, a factor or person who is concerned in managing the trade of another.

CABALLARIA, in middle-age writers, lands held by the tenure of furnishing a horseman, with suitable equipage, in time of war, or when the lord had occasion for him.

CABALLEROS, or CAVALLEROS, are Spanish wools, of which there is a pretty considerable trade at Bayonne in France.

CABALLINE, denotes something belonging to horses: thus caballine aloes is so called, from its being chiefly used for purging horses; and common brimstone is called *sulphur caballinum* for a like reason.

CABALLINUM, (anc. geog.), a town of the *Ædui* in Gallia Celtica; now *Challon sur Saone*, which see.

CABALLINUS, (anc. geog.), a very clear fountain of mount Helicon in Beotia; called *Hippocrene* by the Greeks, because opened by Pegasus on striking the rock with his hoof, and hence called *Pegasus*.

CABALLIO, or CABELLIO, (anc. geog.), a town of the Cavares in Gallia Narbonensis, situated on the Druentia. One of the Latin colonies, in the Notitiæ called *Civitas Cabelliorum*. Now *Cavaillon* in Provence. See CAVAILLON.

CABBAGE, in botany. See BRASSICA.—In the Geographical essays, we find this plant greatly recommended as an excellent food for cattle, producing much dung, and being an excellent substitute for hay. The author prefers the Scotch kind, as being most durable, and preferable on all other accounts. He also recommends autumn-sowed plants in preference to those sowed in the spring; the former producing a much more weighty crop than the latter. The expence of raising an acre of good cabbages he values at 14*l.* 15*s.* and its produce at 34*l.*

CABBAGE-Tree, the English name of a species of PALMA.

CABBALA, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabbala signifies tradition; and the Rabbins, who are called *cabbalists*, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages of scripture. There are no sure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed *cabbala*.

The cabbalists have abundance of names which they call *sacred*; these they make use of in invoking of spirits, and imagine they receive great light from them. They tell us, that the secrets of the cabbala were discovered to Moses on mount Sinai; and that these have been delivered to them down from father to son, without interruption, and without any use of letters; for

to write them down, is what they are by no means permitted to do. This is likewise termed the *oral law*, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called *artificial*, which consists in searching for abstruse and mysterious significations of a word in Scripture, from whence they borrow certain explanations, by combining the letters which compose it: this cabbala is divided into three kinds, the gematric, the notaricon, and the temura or temurah. The first whereof consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called *notaricon*, consists in taking every particular letter of a word for an entire diction; and the third, called *temurah*, i. e. change, consists in making different transpositions or changes of letters, placing one for the other, or one before the other.

Among the Christians, likewise, a certain sort of magic is, by mistake, called *cabbala*; which consists in using improperly certain passages of Scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries among the Jews, believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABBALISTS, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sects; the karaites, who refuse to receive either tradition or the talmud, or any thing but the pure text of scripture; and the rabbinites, or talmudists, who, besides this, receive the traditions of the ancients, and follow the talmud.

The latter are again divided into two other sects; pure rabbinites, who explain the scripture, in its natural sense, by grammar, history, and tradition; and cabbalists, who, to discover hidden mystical senses, which they suppose God to have couched therein, make use of the cabbala, and the mystical methods above mentioned.

CABECA, or CABBESSE, a name given to the finest silks in the East Indies, as those from 15 to 20 per cent. inferior to them are called *barina*. The Indian workmen endeavour to pass them off one with the other; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skins one after another. The Dutch distinguish two sorts of cabecas; namely, the moor cabeca, and the common cabeca. The former is sold at Amsterdam for about 21½ schellingen Flemish, and the other for about 18½.

CABECA de Vide, a small sea-port town of Alentejo in Portugal, with good walls, and a strong castle. W. Long. 6. 43. N. Lat. 39. 0.

CABENDA, a sea-port of Congo in Africa, situated in E. Long. 12. 2. S. Lat. 4. 5.

CABES, or CABBES, a town of Africa, in the kingdom of Tunis, seated on a river near the gulf of the same name. E. Long. 10. 55. N. Lat. 33. 40.

CABEZZO, a province of the kingdom of Angola

in Africa; having Oacco on the north, Lubolo on the south, the Coanza on the north-east, and the Reinba on the south-west. It is populous, and well stored with cattle, &c. and hath a mine of iron on a mountain from thence called the *iron mountain*, which yields great quantities of that metal; and this the Portuguese have taught the natives to manufacture. This province is watered by a river called *Rio Longo*, and other small rivulets, lakes, &c. The trees here are vastly large; and they have one sort not unlike our apple-trees, the bark of which being flaked with a knife, yields an odoriferous resin of the colour and consistency of wax, and very medicinal in its nature, only a little too hot for Europeans, unless qualified by some cooling drug.

CABIDOS, or CAVIDOS, a long measure used at Goa, and other places of the East Indies belonging to the Portuguese, to measure stuffs, linens, &c. and equal to $\frac{3}{4}$ of the Paris ell.

CABIN, a room or apartment in a ship where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain or commander. In ships of the line this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments where the inferior officers or common sailors sleep and mess are usually called *BIRTHS*; which see.

The bed-places built up for the sailors at the ship's side in merchantmen are also called *cabin*.

CABINET, the most retired place in the finest part of a building, set apart for writing, studying, or preserving any thing that is precious.

A complete apartment consists of a hall, anti-chamber, chamber, and cabinet, with a gallery on one side. Hence we say, a cabinet of paintings, curiosities, &c.

CABINET, also denotes a piece of joiner's workman-ship, being a kind of press or chest, with several doors and drawers.

There are common cabinets of oak or of chestnut, varnished cabinets of China and Japan, cabinets of inlaid work, and some of ebony, or the like scarce and precious woods.

Formerly the Dutch and German cabinets were much esteemed in France; but are now quite out of date, as well as the cabinets of ebony which came from Venice.

CABIRI, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothracia. They were also worshipped in other parts of Greece, as Lemnos and Thebes, where the cabiria were celebrated in honour of them; these gods are said to be, in number, four, viz. Axieros, Axiocerca, Axiocerus, and Casmilus.

CABIRIA, festivals in honour of the Cabjri, celebrated in Thebes and Lemnos, but especially in Samothracia, an island consecrated to the Cabiri. All who were initiated into the mysteries of these gods, were thought to be secured thereby from storms at sea, and all other dangers. The ceremony of initiation was performed by placing the candidate, crowned with olive-branches, and girded about the loins with a purple ribband, on a kind of throne, about which the priests, and persons before initiated, danced.

CABLE, a thick, large, strong rope, commonly of hemp, which serves to keep a ship at anchor.

There

Cable.

There is no merchant-ship, however weak, but has at least three cables; namely, the chief cable, or cable of the sheet-anchor, a common cable, and a smaller one.

Cable is also said of ropes, which serve to raise heavy loads, by the help of cranes, pulleys, and other engines. The name of *cable* is usually given to such as have, at least, three inches in diameter; those that are less are only called *ropes*, of different names according to their use.

Every cable, of whatsoever thickness it be, is composed of three strands; every strand of three ropes; and every rope of three twists: the twist is made of more or less threads, according as the cable is to be thicker or thinner.

In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from twining or entangling, they hang, at the end of each strand and of each rope, a weight of lead or of stone.

The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen for their own account, or freight them for the account of others.

A table of the number of threads and weight of cables of different circumferences.

Circumf.	Threads.	Weight.
3 inches	48	192 pounds.
4	77	308
5	121	484
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

Sheet-Anchor Cable, is the greatest cable belonging to a ship.

Stream Cable, a hawser or rope, something smaller than the bowers, and used to moor the ship in a river or haven, sheltered from the wind and sea, &c.

Serve or Plate the Cable, is to bind it about with ropes, cloths, &c. to keep it from galling in the hawse.

To Splice a Cable, is to make two pieces fast together, by working the several threads of the rope the one into the other.

Pay more Cable, is to let more out of the ship. *Pay cheap the Cable*, is to hand it out apace. *Veer more Cable*, is to let more out, &c.

Cable's Length, a measure of 120 fathoms, or of the usual length of the cable.

CABLED, in heraldry, a term applied to a cross formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope; more properly called a *cross corded*.

CABLED Flute, in architecture, such flutes as are filled up with pieces in the form of a cable.

CABO DE ISTRIA, the capital town of the province of Istria, in the territory of Venice; and the see of a bishop. It is seated on a small island in the gulf of Venice, and is joined to the main land by draw-bridges. E. Long. 14. 22. N. Lat. 45. 49.

CABOCHED, in heraldry, is when the heads of beasts are borne without any part of the neck, full-faced.

CABOLETTO, in commerce, a coin of the republic of Genoa, worth about 3 d. of our money.

CABOT (Sebastian), the first discoverer of the continent of America, was the son of John Cabot a Venetian. He was born at Bristol in 1477; and was taught by his father, arithmetic, geometry, and cosmography. Before he was 20 years of age he made several voyages. The first of any consequence seems to have been made with his father, who had a commission from Henry VII. for the discovery of a north-west passage to India. They failed in the spring of 1497; and proceeding to the north-west they discovered land, which for that reason they called *Prinavista*, or *Newfoundland*. Another smaller island they called *St John*, from its being discovered on the feast of St John Baptist; after which, they sailed along the coast of America as far as Cape Florida, and then returned to England with a good cargo, and three Indians aboard. Stowe and Speed ascribe these discoveries wholly to Sebastian, without mentioning his father. It is probable that Sebastian, after his father's death, made several voyages to these parts, as a map of his discoveries, drawn by himself, was hung up in the privy-garden at Whitehall. However, history gives but little account of his life for near 20 years; when he went to Spain, where he was made pilot-major, and intrusted with reviewing all projects for discoveries, which were then very numerous. His great capacity and approved integrity induced many eminent merchants to treat with him about a voyage by the new found straits of Magellan to the Moluccas. He therefore failed in 1525, first to the Canaries; then to the Cape Verde islands; thence to St Augustine, and the island of Patos; when some of his people beginning to be mutinous, and refusing to pass through the straits, he laid aside the design of failing to the Moluccas; left some of the principal mutineers upon a desert island; and, failing up the rivers of Plate and Paraguay, discovered, and built forts in, a large tract of fine country, that produced gold, silver, and other rich commodities. He thence dispatched messengers to Spain for a supply of provisions, ammunition, goods for trade, and a recruit of men: but his request not being readily complied with, after staying five years in America, he returned home; where he met with a cold reception, the merchants being displeased at his not having pursued his voyage to the Moluccas,

Cable
Cabot.

Moluccas, while his treatment of the mutineers had given umbrage at court. Hence he returned to England; and being introduced to the duke of Somerset, then lord protector, a new office was erected for him: he was made governor of the mystery and company of the merchant-adventurers for the discovery of regions, dominions, islands, and places unknown; a pension was granted him, by letters-patent, of 166*l.* 13*s.* 4*d.* per annum; and he was consulted in all affairs relative to trade. In 1522, by his interest, the court fitted out some ships for the discovery of the northern parts of the world. This produced the first voyage the English made to Russia, and the beginning of that commerce which has ever since been carried on between the two nations. The Russia company was now founded by a charter granted by Philip and Mary; and of this company Sebastian was appointed governor for life. He is said to be the first who took notice of the variation of the needle, and who published a map of the world. The exact time of his death is not known, but he lived to be above 70 years of age.

CABRA, a town of the kingdom of Tombut in Africa. It is a large town, but without walls; and is seated on the river Niger, about 12 miles from Tombut. The houses are built in the shape of bells; and the walls are made with stakes or hurdles, plastered with clay, and covered with reeds after the manner of thatch. This place is very much frequented by negroes who come here by water to trade. The town is very unhealthy, which is probably owing to its low situation. The colour of the inhabitants is black, and their religion a sort of Mahometanism. They have plenty of corn, cattle, milk, and butter; but salt is very scarce. The judge who decides controversies is appointed by the king of Tombut. E. Long. o. 50. N. Lat. 14. 21.

CABUL, or GABOUL, a city of Asia, and capital of the province of Cabulistan. It lies in E. Long. 68. 15. N. Lat. 33. 30. on the frontiers of Great Bukharia, on the south side of the mountains which divide the territories of the Mogul from that part of Great Tary. It is one of the finest places in that part of the world; large, rich, and very populous. As it is considered as the key of the Great Mogul's dominions on that side, great care is taken to keep its fortifications in repair, and a numerous garrison is maintained for its security. It lies in the road between Samarcand and Lahor; and is much frequented by the Tartars, Persians, and Indians. The Ubeck Tartars drive there a great trade in slaves and horses, of which it is said that no fewer than 60,000 are sold annually. The Persians bring black cattle and sheep, which renders provisions very cheap. They have also wine, and plenty of all sorts of eatables. The city stands on a little river which falls into the Indus, and thereby affords a short and speedy passage for all the rich commodities in the country behind it, which, when brought to Cabul, are there exchanged for slaves and horses, and then conveyed by merchants of different countries to all parts of the world. The inhabitants are most of them Indian pagans, though the officers of the Mogul and most of the garrison are Mahometans.

CABULISTAN, a province of Asia, formerly belonging to the Great Mogul; but ceded in 1739 to Koulî Khan, who at that time governed Persia. It is

bounded on the north by Bukharia, on the east by Cashemire, on the west by Zabulistan and Candahar, and on the south by Multan. It is 250 miles in length, 240 in breadth, and its chief town is Cabul. This country in general is not very fruitful; but in the vales they have good pasture-land. The roads are much infested with banditti; which obliges the natives to have guards for the security of travellers. The religion of the Cabulists is pagan; and their extraordinary time of devotion is the full moon in February, and continues for two days. At this time they are clothed in red, make their offerings, dance to the sound of the trumpet, and make visits to their friends in masquerade dresses. They say, their god Crusman killed a giant who was his enemy, and that he appeared like a little child; in memory of which, they cause a child to shoot at the figure of a giant. Those of the same tribe make bonfires, and feast together in a jovial manner. The moral part of their religion consists in charity; for which reason, they dig wells and build houses for the accommodation of travellers. They have plenty of provisions, mines of iron, myrobolans, aromatic woods, and drugs of many kinds. They carry on a great trade with the neighbouring countries; by which means they are very rich, and are supplied with plenty of all things.

CABURNS, on ship-board, are small lines made of spun yarn, to bind cables, seize tackles, or the like.

CACALIA, FOREIGN COLTSFOOT; a genus of the syngenesia order, belonging to the polygamia aequalis class of plants.

Species. 1. The suaveolens, with a herbaceous stalk, is a native of North America. It hath a perennial creeping root which sends out many stalks, garnished with triangular spear-shaped leaves sharply sawed on their edges, of a pale green on their under side, but a deep shining green above, placed alternately. The stalks rise to the height of seven or eight feet, and are terminated by umbels of white flowers, which are succeeded by oblong seeds covered with down. It flowers in August, and the seeds ripen in October. The stalks decay in autumn, and new ones rise in the spring. This plant multiplies greatly by its spreading roots, as also by the seeds which are spread to a great distance by the wind, the down which adheres to them being greatly assisting to their conveyance. The roots which have been calc out of Chelsea garden, being carried by the tides to a great distance, have fixed themselves to the banks of the river, and increased so much, that in a few years this species may probably appear as a native of England. 2. The ficoides is a native of the Cape of Good Hope. It rises with strong round stalks to the height of seven or eight feet, woody at bottom, but soft and succulent upward, sending out many irregular branches, garnished more than half their length with thick, taper, succulent leaves, a little compressed on two sides, ending in points, covered with a whitish glaucous farina, which comes off when handled. These, when broken, emit a strong odour of turpentine, and are full of a viscid juice; at the extremity of the branches the flowers are produced in small umbels; they are white, tubulous, and cut into five parts at the top. Some of the French noblemen have the leaves of this plant pickled; in doing of which they have a contrivance to preserve the white farina with which they are covered, and thereby render them very beautiful. 3. The kleinia, with a compound

Cacalia.

compound shrubby stalk, grows naturally in the Canary islands, but has been long cultivated in the English gardens. It rises with a thick fleshy stem divided at certain distances, as it were, into so many joints. Each of these divisions swell much larger in the middle than they do at each end; and the stalks divide into many irregular branches of the same form, which, toward their extremities are garnished with long, narrow, spear-shaped leaves of a glaucous colour, standing all round the stalks without order. As they fall off, they leave a scar at the place, which always remains on the branches. The flowers are produced in large clusters at the extremity of the branches, which are tubulous, and of a faint carnation colour. They appear in August and September, but continue great part of October, and are not succeeded by seeds in this country. There have been stones and fossils dug up at a very great depth in some parts of England having very perfect impressions of this plant upon them; from whence Dr Woodward has supposed the plants were lodged there at the universal deluge; and finding the impressions of many other plants and animals which are natives of those islands, he concludes that the waters flowed hither from the south-west. This plant has been called the *cabbage-tree*, from the resemblance which the stalk of it has to the cabbage: others have intitled it *carnation-tree*, from the shape of the leaves and the colour of the flowers. Besides these, there are seven other species, *viz.* the alpina, with kidney-shaped leaves; the glabra, with smooth leaves; the atriplicifolia, with heart-shaped sinuated leaves; the papillaris, with a shrubby stalk guarded on every side with broken rough footstalks; the ante-euphorbium, with oblong oval leaves; the sonchifolia, with lyre-shaped indented leaves; and the lutea, with leaves divided into five acute parts.

Culture. All the three species described above are very easily propagated. The first will propagate itself, as already mentioned, either by roots or seeds. The second is easily propagated by cuttings during the summer months: these should be cut from the plants and laid to dry a fortnight, that the wound may be healed over before they are planted. Most people plunge the pots in which these are planted into an hot-bed, to promote their putting out roots; but if planted in June or July, they will root as well in the open air. Even branches broken off by accident have frequently put out roots when fallen on the ground, without any care. These branches may be kept six months out of the ground, and will take root if planted. This should have a light sandy earth, and in winter be placed in an airy glass-case, where they may enjoy the sun and air in mild weather, but must be protected from frost. During the winter season the plants must have but little water; and in summer, when they are placed in the open air, it should not be given to them too often, nor in great quantity. The third is also propagated by cuttings, and the plants require the same culture; but must have a dry warm glass-case in winter, and very little water, being subject to rot with wet. In summer they must be placed in the open air in a warm sheltered situation, and in very dry weather refreshed moderately with water. With this management the plants will flower annually, and grow to the height of eight or ten feet.

Cacao.

CACAO, the CHOCOLATE-NUT TREE, is by Linnaeus joined to the theobroma, a genus of the pentandria order, belonging to the polyadelphia class of plants; but of the true chocolate-nut there is only one species known, which we therefore choose to describe separately. The tree producing it is by Mr Catesby said to be about 8 inches in thickness, and 12 feet in height, with a smooth shining bark. The leaves grow alternately, are broad and pointed, set on flat pedicles near an inch long. The flowers come forth only from the trunk and larger branches, in clusters of about eight or ten; each flower consisting of five capular leaves, and five petals, with lamina, and a stylus. To one of these little tufts of blossoms usually succeeds a single fruit about the size of a swan's egg, but longer, more tapering, and ending in a point. The fruit hangs pendant; and, when ripe, has a shell of a purple colour, in substance somewhat like that of a pomegranate, and furrowed from end to end; containing in the middle many kernels of the size of acorns, inclosed in a mucilaginous substance, and which are known amongst us by the name of *cacao-nuts*, of which CHOCOLATE is made. See Plate LXVI. fig. 1. where n° 1. shews the fruit hanging on the tree; and n° 2. is a transverse section of the nut, shewing the included kernels.

This tree is a native of America, and no other part of the world. The places of its growth, according to Mr Catesby, are the bay of Campeachy on Costa Rica between Portabel and Nicaragua, the coast of Coracoco, Guajaquil, and Colima. All the sugar islands, however, are proper for its cultivation; and the same author assures us, that, in the year 1714, he saw the remains of extensive cacao-walks planted by the Spaniards while in possession of that island; and he complains very much of the neglect of its cultivation by the British planters. Mr Miller, after making complaints of the same kind, gives directions, to the following purpose, for cultivating the chocolate-tree.

The proper situation for chocolate-trees is in a place where they may be protected from the winds, which would soon destroy them. Such places, therefore, where torrents of water have washed away the earth so as to leave broad and deep furrows, are very proper for this purpose. The soil in these *gullies* (as the inhabitants call them) is very rich and moist, which the chocolate-trees require, and where they will thrive exceedingly; but where there are not a sufficient number of gullies, choice should be made of a situation well sheltered by large trees; or if there are not trees already grown, there should be three or four rows planted round the spot which is designed for the chocolate-trees, of such sorts as are of the quickest growth; and within these rows should be some plantain-trees planted at proper distances, which, being very quick of growth, and the leaves very large, will afford a kindly shelter to the young chocolate-trees planted between them. As the chocolate-trees do not spread their branches very wide, it will be sufficient to place the plantain-trees 24 feet asunder; in which case, there may be two rows of chocolate-trees between them, placing them at ten feet distance from each other in the row. Before the plantation is begun, the ground should be well prepared by digging it deep, and clearing it from roots of trees and noxious plants, which, if suffered to remain in the ground, will shoot up again after the first rain, and greatly

greatly obstruct the growth of the cacao-plants. When the ground is thus prepared, the rows should be marked out by a line where the nuts are to be planted, so as that they may be placed in a quincunx order, at equal distance every way, or at least that the plantain-trees between them may form a quincunx with the two rows of chocolate-trees which are placed between them. The nuts should be planted in a rainy season, and in the places where they are to remain, for they seldom bear transplanting. As the fruit ripens at two different seasons, viz. at Midsummer and at Christmas, the plantation may be made at any of these times; but care must be taken to choose such as are perfectly ripe and sound, otherwise the whole trouble and expence will be lost. The manner of planting is to make three holes in the ground, within two or three inches of each other, at the place where every tree is to stand; and into each of these holes one nut should be planted about two inches deep, covering them gently with earth. The reason of planting three nuts is, that they seldom all grow; or if they do, all are not equally vigorous; so that, when the plants have had one year's growth, it will be easy to draw up the weak unpromising plants, and leave the most vigorous. It is proper, however, to observe, that the chocolate-nuts will not retain their power of vegetation long after they are taken from the trees: so that there is no possibility of transporting them to any great distance for planting; nor should they be kept long out of the ground in the natural places of their growth. When the chocolate-trees first appear above ground, they are very tender, and subject to great injuries from the winds, sun, or drought: for these reasons, besides the shelter of trees already mentioned, it would be proper to have the plantation near a river, and to plant a row of cassada* on each side of the rows of chocolate-trees, which will grow about seven or eight feet high, and screen the young plants from the violence of the sun the first season; after which they will be in less danger therefrom; and the following season, when the cassada is taken up for use, the ground should be worked between the young plants, taking care not to injure their roots by the operation. The plantain-trees should be set two or three months before the chocolate-nuts are ripe, that they may be large enough to afford shelter to the young plants; and the cassada is always planted a month or six weeks before the chocolate-nuts, for the same reason. Some people, instead of cassada, plant potatoes or cucumbers and melons between the young chocolate-plants: but where this is done, it must be with great caution; for if suffered to approach too near the plants, they will greatly injure, if not totally destroy, them. In about seven or eight days after the chocolate-nuts are planted, the young plants will begin to appear above ground; when they should be carefully looked over, to see if any of them are attacked by insects; in which case, these insects must be destroyed, or they will soon devour the plants; or if there are any weeds produced near the plants, they should be carefully cut down with a hoe. About 20 days after the plants have appeared, they will be five or six inches high, and have four or six leaves according to the strength of the plants. In about a year, they will be two feet and an half high, and have 14 or 16 leaves. By this time the cassada, which was planted between the rows of chocolate-plants, will have large roots fit

Vol. III.

for use, therefore should be taken up; and the ground being then wrought over again will greatly encourage the young chocolate-plants. In two years time the young trees will have grown to the height of three feet and an half or four feet, and many of them will begin to flower. These early blossoms, however, should be carefully taken off; for if permitted to remain and produce fruit, they will so much weaken the trees, that they seldom recover their strength again so as to become vigorous. In half a year after, they will produce flowers again; and these also should be all pulled off; none being left to produce fruit till the third year, and then but a few in proportion to the strength of the trees. By following this method, the trees will always produce larger and better nourished fruit than those which are suffered to bear a greater quantity, and will continue much longer in vigour. The fourth year, the trees may be suffered to bear a moderate crop; but even then it is better to pull off some flowers from those trees which are weak, that they may recover strength before they are too old. From the time when the flowers fall off to the maturity of the fruit is about four months.

When the fruit is ripe, the planters generally employ a negro for every row of trees, to gather it. Being furnished with a basket, he goes from tree to tree, cutting off all the ripe fruit. When the basket is full, the fruit is laid on a heap at one end of the plantation; where, after the whole is gathered, they cut the pods lengthwise, and take out all the nuts, carefully divesting them of the pulp adhering to them. Then they carry them to the house, where they lay them in large casks, or other vessels of wood raised above the ground, covering them with leaves of the Indian reed, and mats, upon which they lay some boards, putting stones thereon to keep them down close in order to press the nuts. In these vessels the nuts are kept four or five days; during which time they must be stirred and turned every morning; otherwise they will be in danger of perishing from the great fermentation they are usually in. Without this fermentation, it is said, the nuts will not keep, but sprout if they are in a damp place, or shrivel and dry too much if they are exposed to heat. After the nuts have been thus fermented, they should be taken out of the vessels, and spread on coarse cloths where they may be exposed to the sun and wind; but at night, or in rainy weather, they must be taken under shelter, otherwise the damp will spoil them. If the weather proves fair, three days time will be long enough to dry them, provided they are carefully turned from time to time, that they may dry equally on every side. When they are perfectly dry, they may be put into boxes or sacks, and preserved in a dry place until they are shipped off or otherwise disposed of. The fresher these nuts are, the more oil is contained in them; so that the older they are, the less they are esteemed. The chocolate-trees, if planted on a good soil, and properly taken care of, will continue vigorous and fruitful 25 or 30 years. Besides all the above-mentioned cultivation, they require their dead and decayed branches to be taken off, and likewise the small ill-placed branches to be removed. This, however, must be done very cautiously: no vigorous branches should be shortened, nor any large amputations made on these trees; because they abound with a soft, glutinous

9 L

milky

* See *Jatropha*.

milky juice, which will flow out for many days whenever they are wounded, and this greatly weakens the trees. Such branches, however, whose extreme branches are decayed, should be cut off; to prevent the infection from proceeding further; and such branches as are much decayed should be taken off close to the stem of the tree: but this should be performed in dry weather, soon after the crop of fruit is gathered.—Notwithstanding all this tedious work, however, Mr Miller is of opinion that the culture of these trees is the most profitable way in which a plantation can be laid out. Five or six negroes, he says, will be able to manage a plantation of 10,000 trees of this kind. The profit of each tree, he thinks, may be valued at 5 s. annually; in which case, such a plantation would be worth 2500l. *per annum*.

In order to cultivate this plant in Europe by way of curiosity, it will be necessary to have the nuts planted in boxes of earth (in the countries where they grow) soon after they are ripe, because they will otherwise lose the power of vegetation before they arrive. When the plants begin to appear above ground, they should be carefully watered in dry weather, and protected from the violent heat of the sun, which is very injurious to these plants, especially while they are young. They should also be very clear from weeds; which, if suffered to grow in the boxes, would soon overbear and destroy the plants. When they are grown strong enough to transport, they should be shipped, and placed where they may be screened from strong winds, salt water, and the violent heat of the sun. During their passage, they must be frequently refreshed with water; but it must not be given them in great quantities, or they will be in danger of rotting. When they come into a cool climate, they must be carefully protected from the cold, and will not require water so frequently. When arrived in Britain, they should be carefully taken out of the boxes, and each transplanted into a separate pot filled with light rich earth, and plunged into a moderate hot-bed of tanner's bark, being careful to cover the glasses in the heat of the day to screen them from the sun: they must also be frequently watered; but it must be done with caution, not to rot their roots. In this hot-bed the plants may remain till Michaelmas; when they must be removed into the bark-house, and plunged into the tan in the warmest part of the stove. They are too tender to live in the open air in this country, even at the warmest season of the year; and therefore they must be constantly kept in the stove, observing in summer to give them plenty of fresh air, and in winter to keep them very warm. This close confinement in the house makes them subject to contract stink; for which reason they must be frequently washed, or they would be over-run with insects.

The Spaniards and Portuguese were the first Europeans whom the Americans made acquainted with cacao. They made use of it many years without communication thereof to any other nations. So little was it known in those days, that the Dutch privateers, being ignorant of the value of the prizes of cacao they took, used to throw all the nuts into the sea, calling them in derision *sheep's treading*. In the year 1649, they knew but of one cacao-tree in all the Antilles; and this was planted out of curiosity in the garden of an Englishman settled in the island of St Croix. In 1655, the

Caribs shewed to Mons. du Parquet several cacao-trees in the woods of the island of Martinico, of which he was the owner. This discovery gave occasion to that of several other trees of the same kind in other woods of that island; and the cacao-walks afterwards planted there very probably owed their origin to the nuts taken from these woods. One Benjamin planted there the first cacao-walk about the year 1660; but it was not till 20 or 25 years after that the inhabitants of this island began to apply themselves to the cultivation of these trees, so as to make walks or plantations of them. There are some places in America where the cacao nuts or grains are used as money, but only among the natives: they give 12 or 14 grains for a Spanish rial. The uses to which cacao is put may be reduced to three. It is made into a sweet-meat; also into chocolate (see CHOCOLATE); and there is an oil extracted from it to which they also give the name of *butter*. The oil is as sweet as that of almonds, and is made after the same manner. Some of the Creolian ladies of America use it as a cosmetic, to render the complexion fresh, and the skin soft and smooth. The cacao of the Caraccas is sold at Amsterdam for 8½ stivers per pound, more or less: when it is in casks, they allow 50 much for tare; but when it is in bags, the tare is according to the weight. From 100 to 229 pounds, the tare is reckoned 2 pounds; from 230 to 249, 3 pounds; from 250 to any weight above that, 4 pounds. The serons, to 99 pounds weight, give 8 pounds tare per cask; those of 100 pounds and above, 10 per cent. The cacao of Martinico is commonly in casks, which are tared by the weight. If it is in bags, the same tare is allowed as for that of the Caraccas.

CACERES, a town of Spain, in the province of Extremadura, is seated on the river Saler, and noted for the exceeding fine wool which the sheep bear in the neighbourhood. Between this town and Brocos, there is a wood, where the allies defeated the rear-guard of the duke of Berwick, on the 7th of April, 1706. E. Long. 6.47. N. Lat. 39.15.

CACHALOT, in ichthyology. See PHYSETER. CACHAN, or CASHAN, a considerable town of Persia in Irac Agemi, where they carry on an extensive trade in silks, silver and gold brocades, and fine earthen ware. It is situated in a vast plain, 55 miles from Ispahan. E. Long. 50. 2. N. Lat. 34. 10.

CACHAO, a province of the kingdom of Tongquin in Asia, situated in the heart of the kingdom, and surrounded by the other seven. Its soil is fertile, and in some places mountainous, abounding with variety of trees, and particularly that of varnish. Most of these provinces carry on some branch of the silk manufacture, but this most of all. It takes its name from the capital, which is also the metropolis of the whole kingdom, though in other respects hardly comparable to a Chinese one of the third rank.

CACHAO, a city of the province of that name, in the kingdom of Tongquin in Asia, situated in E. Long. 105. 31. N. Lat. 22. 10. at about 80 leagues distance from the sea. It is prodigiously crowded with people, inasmuch that the streets are hardly passable, especially on market-days. These vast crowds, however, come mostly from the neighbouring villages; upon which account these villages have been allowed their halls in particular parts of the city, where they bring and dispose

pofo of their wares. The town itself, though the metropolis of the whole Tonquinese kingdom, hath neither walls nor fortifications. The principal streets are wider and airy, but the rest of them narrow and ill-paved; and, except the palace royal and arsenal, the town hath little else worth notice. The houses are low and mean, mostly built of wood and clay, and not above one story high. The magazines and warehouses belonging to foreigners are the only edifices built of brick; and which, though plain, yet, by reason of their height and more elegant structure, make a considerable show among those rows of wooden huts. From the combustibility of its edifices, this city suffers frequent and dreadful conflagrations. These spread with such surprising velocity, that some thousands of houses are often laid in ashes before the fire can be extinguished. To prevent these sad consequences, every house hath, either in its yard, or even in its centre, some low building of brick, in form of an oven, into which the inhabitants on the first alarm convey their most valuable goods. Besides this precaution, which every family takes to secure their goods, the government obliges them to keep a cistern, or some other capacious vessel, always full of water on the top of their house, to be ready on all occasions of this nature; as likewise a long pole and bucket, to throw water from the kennel upon the houses. If these two expedients fail of suppressing the flames, they immediately cut the straps which fasten the thatch to the walls, and let it fall in and waste itself on the ground. The king's palace stands in the centre of the city; and is surrounded with a stout wall, within whose circumference are seen a great number of apartments two stories high, whose fronts and portals have something of the grand taste. Those of the king and his wives are embellished with variety of carvings and gildings after the Indian manner, and all finely varnished. In the outer court are a vast number of sumptuous stables for the king's horses and elephants. The appearance of the inner courts can only be conjectured; for the avenues are not only shut to all strangers, but even to the king's subjects, except those of the privy council, and the chief ministers of state: yet we are told, that there are stair-cases by which people may mount up to the top of the walls, which are about 18 or 20 feet high; from whence they may have a distant view of the royal apartments, and of the fine parterres and fish-ponds that are between the circumference and them. The front wall hath a large gate well ornamented, which is never opened but when the king goes in and out; but at some distance from it on each side there are two posterns, at which the courtiers and servants may go in and out. This circumference, which is of a vast circumference, is faced with brick within and without, and the whole structure is terminated by wide spacious gardens; which, though stored with great variety of proper ornaments, are destitute of the grandeur and elegance observed in the palaces of European princes. — Besides this palace, the ruins of one still more magnificent are to be observed, and are called *Lihatvia*. The circumference is said to have been betwixt six and seven miles: some arches, porticoes, and other ornaments, are still remaining; from which, and some of its courts paved with marble, it may be concluded to have been as magnificent a structure as any of the eastern parts can shew. The arsenal is likewise a large

and noble building; well stored with ammunition and artillery. The English factory is situated on the north side of the city, fronting the river *Song-koy*. It is a handsome low-built house, with a spacious dining-room in the centre; and on each side are the apartments of the merchants, factors, and servants. At each end of the building are smaller houses for other uses, as store-houses, kitchen, &c. which form two wings with the square in the middle, and parallel with the river, near the bank of which stands a long flag-staff, on which they commonly display the English colours on Sundays and all remarkable days. Adjoining to it, on the south side, is the Danish factory, which is neither so large nor so handsome. On the same side of the river runs a long dike, whose timber and stones are so firmly fastened together, that no part of it can be stirred without moving the whole. This work was raised on those banks to prevent the river, during the time of their vault rains, from overflowing the city; and it has hitherto answered its end; for though the town stands high enough to be in no danger from land-floods, it might yet have been otherwise frequently damaged, if not totally laid under water, by the overflowing of that river. Some curious observations have been communicated to the royal society concerning differences between the tides of those seas and those of Europe, viz. that on the Tonquinese coast ebbs and flows but once in 24 hours; that is, that the tide is rising during the space of 12 hours, and can be easily perceived during two of the moon's quarters, but can hardly be observed during the other two. In the spring tides, which last 14 days, the waters begin to rise at the rising of the moon; whereas in the low tides, which continue the same number of days, the tide begins not till that planet is got below the horizon. Whilst it is passing through the six northern signs, the tides are observed to vary greatly, to rise sometimes very high, and sometimes to be very low; but when it is once got into the southern part of the zodiac, they are then found to be more even and regular.

CACHECTIC, something partaking of the nature of, or belonging to, a cachexy.

CACHEO, a town of Negroland in Africa, seated on the river St Domingo. It is subject to the Portuguese, who have three forts there, and carry on a great trade in wax and slaves. W. Long. 14. 55. N. Lat. 12. 0.

CACHEXY, in medicine, a vicious state of the humours and whole habit*.

CACHRYS, a genus of the pentandria order, belonging to the digynia class of plants. There are five species, viz. the trifida, with bipinnated leaves; the ficula, with double winged leaves; the libanotis, with smooth furrowed seeds; the linearia, with plain channelled fruit; and the hungarica, with a plain, funguous, channelled seed. All these are perennial plants, rising pretty high, and bearing large umbels of yellow flowers, and may be propagated by seeds which ought to be sown soon after they are ripe; for if they are kept out of the ground till the next spring, they often miscarry. They must also be sown in a shady border where they are to remain: for the plants, having long tap-roots, will not bear transplanting so well as many others. The Hungarians in the neighbourhood of Erlaw, and those who border on Transylvania, Servia,

* See (the Index joined to) Medicine.

Cacochylia, &c. eat the root of the fifth species in a scarcity of corn for want of other bread.

CACOCCHYLIA, or **CACOCHYMIA**, a vicious state of the vital humours, especially of the mafs of blood; arising either from a diforder of the fecretions or excretions, or from external contagion. The word is Greek, compounded of *κακός* ill, and *χυμός* juice.

CACTUS, **MELON-THISTLE**; a genus of the monogynia order, belonging to the icofandria clafs of plants. To this genus Linæus has added the *cereus* and *opuntia*; but to avoid the embarrassment occafioned by the defcription of fuch a variety of fpecies, we choofe, with Mr Miller, to defcribe them as three diftinct genera. See **CERES** and **OPUNTIA**.

Species. 1. The melocactus, with 14 angles, commonly called *great melon-thistle*. 2. The intortus, with 15 angles fpirally twifted, and erect fpires. 3. The recurvus, with 15 angles, having broad recurved fpires fet very clofe. 8. The mammillaris, clofely covered with bearded tubercles; or fmall American melon-thistle. 5. The proliferus, or fmall childing melon-thistle.

All the fpecies of this genus are plants of a fingular ftructure, but efpecially the larger kinds of them; which appear like a large, flefhy, green melon, with deep ribs, fet all over with ftrong fharp thorns; and, when the plants are cut through the middle, their infide is a foft, pale-green, flefhy fubftance, very full of moiſture. The fruit of all the fpecies is frequently eaten by the inhabitants of the Weſt Indies. The fruits are about three quarters of an inch in length, of a taper form, drawing to a point at the bottom toward the plant, but blunt at the top where the empalement of the flower was fited. The taſte is agreeably acid, which in a hot country muſt render the fruit more grateful.

Theſe ftrange plants commonly grow upon the fleep fides of rocks in the warmefſt parts of America, where they ſeem to be thruſt out of the apertures, having little or no earth to fupport them, their roots fhooting down into the fiſſures of the rock to a confiderable depth; fo that it is difficult to get the plants up, efpecially as they are fo ftrongly armed with thorns as to render it very dangerous to handle them. The large kinds were fome time ago brought over to England in much greater plenty than of late; but many of them were deſtroyed by the unkindneſs of thoſe perſons who had the care of them in the voyage: for, by giving them water, they generally cauſed them to rot before they were taken out of the ſhips; and ſome of thoſe which appeared to be found, were yet ſo replete with moiſture, that they rotted foon after they were placed in the ſtoves. Whoever therefore purpoſes to bring theſe plants from abroad, ſhould be very careful to take up their roots as entire as poſſible, and to plant them in tubs filled with ſtones and rubbiſh, having very little earth in it. Three or four plants alſo ought to be put into each tub, in proportion to their ſize, in order to ſave room; for they will not increaſe in bulk during their paſſage, and no room needs be allowed them for this purpoſe. There ſhould be ſeveral pretty large holes bored through the bottoms of theſe tubs, to let the moiſture paſs off; and if the plants are ſet in the tubs a month or more before they are put on ſhipboard, they will at that time have put forth new roots, which

will be the beſt method of making them ſucceed. All the time they remain in their natural country they ſhould have very little water given them, and after they are put on board they muſt have none at all. When they are brought to Britain, the larger forts require a very good ſtove to preferve them through the winter, nor ſhould they be expoſed to the air in ſummer; for although they may continue fair to outward appearance, yet when they have been for ſome time expoſed abroad, they will imbibe moiſture ſufficient to kill them on their readmiſſion to the ſtove, and this will happen very ſuddenly; ſcarce any appearance of diforder will be obſerved till the whole plant is killed, which in a few hours time has often been the fate of the plants when firſt placed in the ſtove. If theſe plants are plunged into a hot-bed of tanners bark in ſummer, it will greatly forward them in their growth: but when this is praſtiſed, there ſhould be ſcarce any water given to the plants; for the moiſture which they will imbibe from the fermentation of the tan will be ſufficient, and more would cauſe them rot. The beſt method to preferve all the large kinds is, in winter to place the pots either upon the top of the flues, or at leaſt very near them, that they may have the warmeſt place of the ſtove, and never to give them any water. The ſoil in which they are planted muſt be of a ſandy nature, and if mixed with ſome dry lime rubbiſh will be ſtill better. In the bottom of the pots ſhould be placed ſome ſtones, in order to drain off any moiſture that may be in the earth; for as theſe plants grow naturally upon the hot, dry, burning rocks, which have no earth, and were it not for theſe plants would be abſolutely barren, we muſt imitate their natural ſoil as near as poſſible, making ſome allowance for the difference of climates. The great forts may be propagated from feeds; but as the plants which are raiſed from feeds in this country will be ſome years in arriving at any conſiderable ſize, it will be much the beſt way to procure ſome plants from the Weſt Indies. The two ſmall forts propagate ſo faſt, the fourth by feeds, and the fifth from the young plants thruſt out from the fides of the old, that it is unneceſſary to ſend for any of them from abroad.

CACUS, in fabulous hiſtory, an Italian ſhepherd upon mount Aventine. As Hercules was driving home the herd of king Geryon whom he had ſlain, Cacus robbed him of ſome of his oxen, which he drew backward into his den leſt they ſhould be diſcovered. Hercules at laſt finding them out by their lowing, or the robbery being diſcovered to him, killed Cacus with his club. He was Vulcan's ſon, of prodigious bulk, and half man half ſatyur.

CADAN, a town of Bohemia, in the circle of Zats, ſeated on the northern bank of the river Egra, in E. Long. 13. 34. N. Lat. 50. 20.

CADE, a cag, calk, or barrel. A cade of herrings is a veſſel containing the quantity of 500 red herrings, or 1000 ſprats.

CADE-Worm, in zoology, the maggot or worm of a fly called *phryganea*. It is uſed as a bait in angling.

CADEA, or **THE LEAGUE OF THE HOUSE OF GOD**, is one of thoſe that compoſe the republic of the Griſons, and the moſt powerful and extenſive of them all. It contains the biſhopric of Coire, the great valley of Engadine, and that of Bragail or Fregal. Of the 11 great, or 21 ſmall communities, there are but two that ſpeak

Cadenac
||
Cadi.

speak the German language; that of the rest is called the *Rhetie*, and is a dialect of the Italian. The Protestant religion is most prevalent in this league, which has been allied to the Swiss cantons ever since the year 1498. Coire is the capital town.

CADENAC, a town of France in Querci, on the confines of Rouergue, seated on the river Lot, in E. Long. 2. 12. N. Lat. 44. 36.

CADENCE, or REPOSE, in music, (from the Latin *cadere* to fall or descend); the termination of an harmonical phrase on a repose, or on a perfect chord *.

CADENCE, in reading, is a falling of the voice below the key-note at the close of every period. In reading, whether prose or verse, a certain tone is assumed which is called the *key-note*; and in this tone the bulk of the words are founded; but this note is generally lowered towards the close of every sentence.

CADENCE, in the menage, an equal measure or proportion, observed by a horse in all his motions; so that his times have an equal regard to one another, the one does not embrace or take in more ground than the other, and the horse observes his ground regularly.

CADENE, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are sold by the piece from one to two piasres per carpet.

CADENET, a town of France in Provence, and in the Vigueirie of Apt. E. Long. 5. 30. N. Lat. 43. 40.

CADET, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal patrimony with the rest. At Caen, in Normandy, the custom, as with us, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

CADET is also a military term denoting a young gentleman who chuses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to obtain a commission in the army. Cadet differs from volunteer, as the former takes pay, whereas the latter serves without pay.

CADI, or CADHI, a judge of the civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of *mollas*.

We find numerous complaints of the avarice, iniquity, and extortion, of the Turkish cadis: all justice is here venal; the people bribe the cadis, the cadis bribe the *moulas*, the *moulas* the *cadilefchers*, and the *cadilefchers* the *moufti*. Each *cadi* has his serjeants, who are to summon persons to appear and answer complaints. If the party summoned fails to appear at the hour appointed, sentence is passed in favour of his adversary. It is usually vain to appeal from the sentences of the *cadi*, since the affair is never heard anew, but judgment is passed on the case as stated by the *cadi*. But the *cadis* are often cashiered and punished for crying in justice with the *bastinado* and *mulfes*; the law, however, does not allow them to be put to death. Constantinople has had *cadis* ever since the year 1390, when Bajazet I. obliged John Palæologus, emperor of the

Cadilefcher
||
Cadmus.

Greeks, to receive *cadis* into the city to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the *cadis* are also judges of religious matters. Among the Moors, *cadis* is the denomination of their higher order of priests or doctors, answering to the rabbins among the Jews.

CADILESCHER, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confined to the soldiery; but that, at present, it extends itself to the determination of all kinds of law-suits; yet is nevertheless subject to appeals.

There are but three *cadilefchers* in all the grand signior's territories: the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable: they have their seats in the divan next to the grand vizir.

CADILLAC, a town of France in Guienne, and in Bazadois, near the river Garonne, with a handsome castle, situated in W. Long. o. 15. N. Lat. 44. 37.

CADIZ, a city and port-town of Andalusia in Spain, situated on the north-west end of the island of Leon, or Lyon, opposite to Port St Mary on the continent, about 60 miles south-west of Seville, and 40 north-west of Gibraltar. W. Long. 6. 40. N. Lat. 36. 30.

The island it stands on is in length about 18 miles: the south-west end is about nine broad; but the other end, where the city stands, not above two. It has a communication with the continent by means of a bridge; and, with the opposite shore, forms a bay of 12 miles long and six broad. About the middle of this bay, there are two head-lands, or promontories, one on the continent, and the other on the island, which advance so near together, that the forts upon them, called the *Puntal* and *Matagorda*, command the passage; and within these forts is the harbour, which it is impossible for an enemy to enter till he has first taken the forts. This port is the station of the American fleet, and is always well furnished with other ships. There were formerly two wonderful springs at Cadiz, but they are now lost, as well as some Phœnician antiquities, as the temple of Hercules, and two brazen pillars, &c. There was likewise a small island in the bay, where the inhabitants had houses of pleasure; but it is now swallowed up. In 1596, Cadiz was taken, pillaged, and burnt, by the English; but in 1702 it was attempted in conjunction with the Dutch, without success.

CADIZADELITES, a sect of Mahometans very like the ancient stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the *ramazan*; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practise circumcision, and justify it by the example of Jesus Christ.

CADMIA. See CALAMINE.

CADMUS, in fabulous history, king of Thebes, the son of Agenor king of Phœnicia, and the brother of Phœnix, Cilix, and Europa. He carried into Greece the 16 simple letters of the Greek alphabet; and there built Thebes, in Bœotia. The poets say, that he left his native country in search of his sister Europa, whom Jupiter had carried away in the form of a bull; and that, inquiring

737.

Cadmus
||
Caduceus.

Caduci
||
Caen.

inquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where she lay down. Having arrived among the Phœnices, he was met by a cow, who conducted him through Boeotia to the place where Thebes was afterwards built: but as he was about to sacrifice his guide to Pallas, he sent two of his company to the fountain Dirce for water; when they being devoured by a serpent or dragon, he slew the monster, and afterwards, by the advice of Pallas, sowed his teeth, when there sprung up a number of armed soldiers, who prepared to revenge the death of the serpent; but on his casting a stone among these upstart warriors, they turned their weapons against each other with such animosity, that only five survived the combat, and these assisted Cadmus in founding his new city. Afterwards, to recompence his labours, the Gods gave him Harmonia, or Hermione, the daughter of Mars and Venus; and honoured his nuptials with presents and peculiar marks of favour. But at length resigning Thebes to Pentheus, Cadmus and Hermione went to govern the Eccleclenses: when grown old, they were transformed into serpents; or, as others say, sent to the Elysian fields, in a chariot drawn by serpents. See THEBES.

CADMUS of Miletum, a celebrated Greek historian, was, according to Pliny, the first of the Greeks who wrote history in prose. He flourished about 550 before Christ.

CADORE, or PIEVE DE CADORE, a town of Italy, in the territory of Venice, and capital of a district called *Cadorino*; famous for the birth of Titian the painter. E. Long. 13. 45. N. Lat. 46. 25.

CADORINO, a province of Italy, in the territory of Venice; bounded on the east by Friuli Proper, on the south and west by the Bellunese, and by the bishopric of Brixen on the north. It is a very mountainous country, but pretty populous. The only town is Pieve de Cadore.

CADRITES, a sort of Mahometan friars, who once a-week spend a great part of the night in turning round, holding each others hand, and repeating incessantly the word *hai*, which signifies *living*, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads; and always go barefooted: they have liberty to quit their convent when they please, and to marry.

CADSAND, an island on the coast of Dutch Flanders, situated at the mouth of the Scheld, whereby the Dutch command the navigation of that river.

CADUCEUS, in antiquity, Mercury's rod or sceptre, being a wand entwined by two serpents borne by that deity as the ensign of his quality and office, given him, according to the fable by Apollo, for his seven-stringed harp. Wonderful properties are ascribed to this rod by the poets; as laying men asleep, raising the dead, &c.

It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin and a caduceus, offering them their choice either of war or peace. Among that people, those who denounced war were called *feciales*; and those who went to demand peace, *caducatores*, because they bore a caduceus in their hand.

The caduceus found on medals is a common symbol,

signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

CADUCI, (from *cado* to fall); the name of a class in Linnæus's *calycina*, consisting of plants whose calix is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the *classis persistentes* in the same method, and is exemplified in mustard and ranunculus.

CADURCI, CADURCUM, *Cadurcus*, and *Cadurx*, (anc. geog.), a town of the Cadurci a people of Aquitania; situated between the rivers Oldus running from the north, and the Tarnis from the south, and falling into the Garumna: now *Cabors*, capital of the territory of the Querci, in Guienne†. A part of the Cadurci, to the south next the Tarnis, were called *E-leutheri*. † See Cadurci.

CADUSII (anc. geog.), a people of Media Atropatene, situated to the west in the mountains, and reaching to the Caspian sea; between whom and the Medes, perpetual war and enmity continued down to the time of Cyrus.

CADUS, in antiquity, a wine-vessel of a certain capacity, containing 80 amphoræ or firkins; each of which, according to the best accounts, held nine gallons.

CÆCILIA, in zoology, a genus of serpents belonging to the amphibia class. The cæcilia has no scales; it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, *viz.* 1. The tentaculata, has 135 rugæ. It is about a foot long, and an inch in circumference, preserving an uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous. 2. The glutinosa, has 340 rugæ or prickles above, and 10 below, the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

CÆCUM, or Cœcum, the blind gut*.

CÆLIUS (Aurelianus), an ancient physician, and the only one of the sect of the methodists of whom we have any remains. He was of Sicca, a town of Numidia; but in what age he lived, cannot be determined: it is probable, however, that he lived before Galen; since, though he carefully mentions all the physicians before him, he takes no notice of Galen. He had read over very diligently the ancient physicians of all sects; and we are indebted to him for the knowledge of many dogmas which are not to be found but in his books *de celeribus et tardis passionibus*. He wrote, as he himself tells us, several other works; but they are all perished.

CÆMENT. See CEMENT.

CÆMENTATION. See CEMENTATION.

CAEN; an handsome and considerable town of France, capital of lower Normandy, with a celebrated university, and an academy of literature. It contains 60 streets, and 12 parishes. It has a castle with four towers, which were built by the English. The town-house is a large building with four great towers. The royal

|| Caernar-
then.

royal square is the handfastest in all Normandy, and has fine houses on three sides of it; and in the middle is the statue of Lewis XIV. in a Roman habit, standing on a marble pedestal, and surrounded with an iron ballustrade. It is seated in a pleasant country on the river Orne, about eight miles from the sea. William the conqueror was buried here, in the abbey of St Stephen which he founded. W. Long. o. 27. N. Lat. 49. 11.

CÆRL, (anc. geog.), a town of Etruria, the royal residence of Mezentius. Its ancient name was *Argyllæ*. In Strabo's time not the least vestige of it remained, except the baths called *cærcana*. From this town the Roman censor's tables were called *cærites tabulæ*. In these were entered the names of such as for some misdemeanor forfeited their right of suffrage, or were degraded from a higher to a less honourable tribe. For the people of Cære hospitably receiving those Romans who, after the taking of Rome by the Gauls, fled with their gods and the sacred fire of Vesta, were, on the Romans recovering themselves from this disaster, honoured with the privilege of the city, but without a right of voting.

CÆRITES TABULÆ. See the preceding article.

CAERFILLY, a town of Glamorganshire in South Wales, seated between the rivers Taif and Rumney, in a moorish ground, among the hills. It is thought the walls, now in ruins, were built by the Romans; there being often Roman coins dug up there. W. Long. 3. 12. N. Lat. 51. 35.

CAERLEON, a town of Monmouthshire in England, and a place of great antiquity. It was a Roman town, as is evident from the many Roman antiquities found here. It is commodiously situated on the river Uik, over which there is a large wooden bridge. The houses are generally built of stone, and there are the ruins of a castle still to be seen. W. Long. 3. o. N. Lat. 51. 40.

CAERMARTHEN-SHIRE, a county of Wales, bounded on the north by Severn sea or St George's channel, Cardiganshire on the south, the shires of Brecknock and Glamorgan on the east, and Pembroke-shire on the west. Its greatest length is between 30 and 40 miles, and its breadth upwards of 20. The air is wholesome, and the soil less rocky and mountainous than most other parts of Wales, and consequently is proportionally more fertile both in corn and pasture. It has also plenty of wood, and is well supplied with coal and limestone. The most considerable rivers are the Towy, the Cothy, and the Tave; of which, the first abounds with excellent salmon. The principal towns are Caermarthen the capital, Kidwely, Lanidovercy, &c. This county abounds with ancient forts, camps, and tumuli or barrows. Near to Caermarthen, towards the east, may be seen the ruins of Kaflek Karrey, which was situated on a steep and inaccessible rock; and also several vast caverns, supposed to have been copper-mines of the Romans. Near this spot is a fountain which ebbs and flows twice in 24 hours like the sea.

CAERMARTHEN, a town of Wales, and capital of the county of that name. It is situated on the river Fowey, over which it has a fine stone-bridge. It is of great antiquity, being the Maridunum of Ptolemy. It is a populous, thriving, and polite place, many of the

neighbouring gentry residing there in the winter. It is a corporation and county of itself, with power to make by-laws. Here were held the courts of chancery and exchequer for South Wales, till the whole was united to England in the reign of Henry VIII. Here was born the famous conjurer Merlin; and near the town is a wood called *Merlin's grove*, where he is said to have often retired for contemplation. Many of his pretended prophecies are still preserved in the country. The town gives the title of *marquis* to his grace the duke of Leeds. This town sends one member to parliament, and the county another.

CAERNARVON-SHIRE, a county of Wales, bounded on the north and west by the sea, on the south by Merionethshire, and on the east is divided from Denbighshire by the river Conway. It is about 40 miles in length, and 20 in breadth; and sends one member to parliament for the shire, and another for the borough of Caernarvon. The air is very piercing; owing partly to the snow, that lies seven or eight months of the year upon some of the mountains, which are so high that they are called the *British Alps*; and partly to the great number of lakes, which are said not to be fewer than 50 or 60. The soil in the valleys on the side next Ireland is pretty fertile, especially in barley; great numbers of black cattle, sheep, and goats, are fed on the mountains; and the sea, lakes, and rivers, abound with variety of fish. The highest mountains in the county are those called *Snowdon hills*, and *Pen-maen-mawr*, which last hangs over the sea. There is a road cut out of the rock on the side next the sea, guarded by a wall running along the edge of it on that side; but the traveller is sometimes in danger of being crushed by the fall of pieces of the rock from the precipices above. The river Conway, though its course from the lake out of which it issues to its mouth is only 12 miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Pearls are found in a large black muscle taken in this river. The principal towns are Bangor, Caernarvon the capital, and Conway. In this county is an ancient road said to have been made by Helena the mother of Constantine the Great; and Matthew of Westminster asserts, that the body of Constantine the father of the same Constantine was found at Caernarvon in the year 1283, and interred in the parish-church there by order of Edward I.

CAERNARVON, a town of Wales, and capital of the county of that name. It was built by Edward I. near the site of the ancient Segontium. It is almost surrounded by the sea and two rivers; gives name to the neighbouring bay; and had anciently a castle, built also by Edward I. in which his son Edward II. was born. It is a small neat town, governed by a constable of the castle who is also mayor, an alderman, two bailiffs, a town-clerk, and other inferior officers. The market is well supplied with provisions, and there is a ferry from hence to Anglesey. The town gives title of *earl* and *marquis* to the duke of Chandos, and has a good tide-harbour.

CAERWIS, a market-town of Flintshire in North Wales, situated in W. Long. 3. 25. N. Lat. 53. 20.

CÆSALPINA, BRASILETTO, or *Brasile-wood*, a genus of the monogymia order, belonging to the decandria class of plants. Of this there are two species.

1. The

Caernarvon-
shire
|| Cæsalpina.

Cæsalpina
Cæsar.

Plate
I. XVII.
fig. 2.

* See Colour-
Making,
and Dyeing.

1. The brasiliensis, commonly called *brasiletto*. 2. The cæsalpina, with small oval and entire leaves.—The first grows naturally in the warmest parts of America, from whence the wood is imported for the dyers, who use it much. The demand has been so great, that none of the large trees are left in any of the British plantations; so that Mr Catesby owns himself ignorant of the dimensions to which they grow. The largest remaining are not above two inches in thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnated; the lobes growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamina and yellow apices, growing in a pyramidal spike, at the end of a long slender stalk: the pods inclose several small round seeds. The colour produced from this wood is greatly improved by solution of tin in aqua regia *.—The second sort is a native of the same countries with the first, but is of a larger size. It sends out many weak irregular branches, armed with short, strong, upright thorns. The leaves branch out in the same manner as the first; but the lobes, or small leaves, are oval and entire. The flowers are produced in long spikes like those of the former, but are variegated with red. These plants may be propagated from seeds, which should be sown in small pots filled with light rich earth early in the spring, and plunged in a bed of tanner's bark. Being tender, they require to be always kept in the stove, and to be treated in the same manner as other exotics of that kind.

CÆSALPINUS of Arezzo, professor at Pisa, and afterwards physician to pope Clement VIII. one of the capital writers in botany. See BOTANY, p. 1284, 1286.

CÆSAR (Julius), the illustrious Roman general and historian, was of the family of the Julii, who pretended they were descended from Venus by Æneas. The descendants of Æscenius son of Æneas and Creusa, and surnamed *Julius*, lived at Alba till that city was ruined by Tullus Hostilius king of Rome, who carried them to Rome, where they flourished. We do not find that they produced more than two branches. The first bore the name of *Tullus*, the other that of *Cæsar*. The most ancient of the Cæsars were those who were in public employments in the 11th year of the first Punic war. After that time we find there was always some of that family who enjoyed public offices in the commonwealth, till the time of Caius Julius Cæsar, the subject of this article. He was born at Rome the 12th of the month Quintilis, year of the city 653, and lost his father an. 669. By his valour and eloquence he soon acquired the highest reputation in the field and in the senate. Beloved and respected by his fellow-citizens, he enjoyed successively every magisterial and military honour the republic could bestow consistent with its own free constitution. But at length having subdued Pompey the great rival of his growing power, his boundless ambition effaced the glory of his former actions: for, pursuing his favourite maxim, "that he had rather be the first man in a village than the second in Rome," he procured himself to be chosen perpetual dictator; and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic rashly assassinated him in the senate-house, where they should only have seized him and

brought him to a legal trial for usurpation. By this impolitic measure they defeated their own purpose, involving the city in consternation and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent; the monarchical government being absolutely founded on the murder of Julius Cæsar. He fell in the 56th year of his age, 43 years before the Christian æra. His commentaries contain a history of his principal voyages, battles, and victories. The London edition in 1712, in folio, is preferred.

The detail of Cæsar's transactions (so far as is consistent with the limits of this work) being given under the article ROME, we shall here only add a portrait of him as drawn by a philosopher *.

"If after the lapse of 18 centuries, the truth may be published without offence, a philosopher might, in the following terms, censure Cæsar without calumniating him, and applaud him without exciting his blushes.

"Cæsar had one predominant passion: it was the love of glory; and he passed 40 years of his life in seeking opportunities to foster and encourage it. His soul, entirely absorbed in ambition, did not open itself to other impulses. He cultivated letters; but he did not love them with enthusiasm, because he had not leisure to become the first orator of Rome. He corrupted the one half of the Roman ladies, but his heart had no concern in the fiery ardours of his senses. In the arms of Cleopatra, he thought of Pompey; and this singular man, who disdained to have a partner in the empire of the world, would have blushed to have been for one instant the slave of a woman.

"We must not imagine, that Cæsar was born a warrior, as Sophocles and Milton were born poets. For, if nature had made him a citizen of Sybaris, he would have been the most voluptuous of men. If in our days he had been born in Pennsylvania, he would have been the most inoffensive of quakers, and would not have disturbed the tranquillity of the new world.

"The moderation with which he conducted himself after his victories, has been highly extolled; but in this he shewed his penetration, not the goodness of his heart. Is it not obvious, that the display of certain virtues is necessary to put in motion the political machine? It was requisite that he should have the appearance of clemency, if he inclined that Rome should forgive him his victories. But what greatness of mind is there in a generosity which follows on the usurpation of supreme power?

"Nature, while it marked Cæsar with a sublime character, gave him also that spirit of perseverance which renders it useful. He had no sooner begun to reflect, than he admired Sylla; hated him, and yet wished to imitate him. At the age of 15, he formed the project of being dictator. It was thus, that the president Montesquieu conceived, in his early youth, the idea of the spirit of laws.

"Physical qualities, as well as moral causes, contributed to give strength to his character. Nature, which had made him for command, had given him an air of dignity. He had acquired that soft and insinuating eloquence, which is perfectly suited to seduce vulgar minds, and has a powerful influence on the most cultivated. His love of pleasure was a merit with the fair

Cæsar. sex; and women, who even in a republic can draw to them the suffrages and attention of men, have the highest importance in degenerate times. The ladies of his age, were charmed with the prospect of having a dictator whom they might subdue by their attractions.

"In vain did the genius of Cato watch for some time to sustain the liberty of his country. It was unequal to contend with that of Cæsar. Of what avail were the eloquence, the philosophy, and the virtue of this republican, when opposed by a man, who had the address to debauch the wife of every citizen whose interest he meant to engage; who, possessing an enthusiasm for glory, wept, because, at the age of 30, he had not conquered the world like Alexander; and who, with the haughty temper of a despot, was more desirous to be the first man in a village, than the second in Rome.

"Cæsar had the good fortune to exist in times of trouble and civil commotions, when the minds of men are put into a ferment; when opportunities of great actions are frequent; when talents are every thing, and those who can only boast of their virtues are nothing. If he had lived an hundred years sooner, he would have been no more than an obscure villain, and, instead of giving laws to the world, would not have been able to produce any confusion in it.

"I will here be bold enough to advance an idea, which may appear paradoxical to those who weakly judge of men from what they achieve, and not from the principle which leads them to act. Nature formed, in the same mould, Cæsar, Mahomet, Cromwell, and Kouli Khan. They all of them united to genius that profound policy which renders it so powerful. They all of them had an evident superiority over those with whom they were surrounded; they were conscious of this superiority, and they made others conscious of it. They were all of them born subjects, and became fortunate usurpers. Had Cæsar been placed in Persia, he would have made the conquest of India; in Arabia, he would have been the founder of a new religion; in London, he would have stabbed his sovereign, or have procured his assassination under the sanction of the laws. He reigned with glory over men whom he had reduced to be slaves; and, under one aspect, he is to be considered as a hero; under another, as a monster. But it would be unfortunate, indeed, for society, if the possession of superior talents gave individuals a right to trouble its repose. Usurpers accordingly have flattered, but no friends; strangers respect them; their subjects complain and submit; it is in their own families that humanity finds her avengers. Cæsar was assassinated by his son, Mahomet was poisoned by his wife, Kouli Khan was massacred by his nephew, and Cromwell only died in his bed because his son Richard was a philosopher.

"Cæsar, the tyrant of his country; Cæsar, who destroyed the agents of his crimes, if they failed in address; Cæsar, in fine, the husband of every wife, and the wife of every husband; has been accounted a great man by the mob of writers. But it is only the philosopher, who knows how to mark the barrier between celebrity and greatness. The talents of this singular man, and the good fortune which constantly attended him till the moment of his assassination, have concealed the enormity of his actions."

CÆSAR, in Roman antiquity, a title borne by all

the emperors, from Julius Cæsar, to the destruction of the empire. It was also used as a title of distinction for the intended or presumptive heir of the empire, as *king of the Romans* is now used for that of the German empire.

This title took its rise from the surname of the first emperor, C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of *Augustus* being appropriated to the emperors, in compliment to that prince, the title *Cæsar* was given to the second person in the empire, though still it continued to be given to the first; and hence the difference betwixt Cæsar used simply, and Cæsar with the addition of Imperator Augustus.

The dignity of Cæsar remained the second of the empire, till Alexius Comnenus having elected Nicephorus Melissenus Cæsar, by contract; and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator, with the precedence over Melissenus; ordering, that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus Cæsar the third.

CÆSAR (Sir Julius), a learned civilian, was descended by the female line from the duke de Cesarini in Italy; and was born near Tottenham in Middlesex, in the year 1557. He was educated at Oxford, and afterwards studied in the university of Paris, where, in the year 1581, he was created doctor of the civil law, and two years after was admitted to the same degree at Oxford, and also became doctor of the canon law. He was advanced to many honourable employments, and for the last 20 years of his life was master of the rolls. He was remarkable for his extensive bounty and charity to all persons of worth, so that he seemed to be the almoner-general of the nation. He died 1639, in the 79th year of his age. It is very remarkable that the manuscripts of this lawyer were offered (by the executors of some of his descendants) to a cheefemonger for waste-paper; but being timely inspected by Mr Samuel Paterfon, this gentleman discovered their worth, and had the satisfaction to find his judgement confirmed by the profession, to whom they were sold in lots for upwards of 500 l. in the year 1757.

CÆSAR *Augusta*, or *Cæsarea Augusta*, (anc. geog.), a Roman colony situated on the river Iberus in the hither Spain, before called *Saluba*, in the territories of the Edetani. Now commonly thought to be *Saragosa*. See that article.

CÆSAREA, the name of several ancient cities, particularly one on the coast of Phenice. It was very conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great king of Judea remedied this inconveniency at an immense expence and labour, making it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed 12 years in the finishing and adorning it.

CÆSARIAN operation, in midwifery. See MIDWIFERY, chap. vi.

CÆSARIANS, *Cæsarienses*, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors; and took possession, in their name, of such things as de-

Cæsarodunum
||
Cassa.

Cassila
||
Cagayan.

involved or were confiscated to them.

CÆSARODUNUM (anc. geog.), a town of the Turones in Celtic Gaul; now *Tours*, the capital of Touraine. See *Tours*.

CÆSAROMAGUS (anc. geog.), a town of the Trinobantes in Britain; by some supposed to be *Chelmsford*, by others *Brentford*, and by others *Burset*.

CÆSENA (anc. geog.), a town of Gallia Cispadana, situated on the rivers *Isapis* and *Rubicon*; now *Cesena*, which see.

CÆSIA SYLVA (anc. geog.), a wood in Germany, part of the great *Sylva Hercynia*, situated partly in the duchy of Cleves, and partly in Westphalia between *Wesel* and *Kesfield*.

CÆSONES, a denomination given to those cut out of their mother's womb. Pliny ranks this as an auspicious kind of birth; the elder *Scipio Africanus*, and the first family of *Cæsars*, were brought into the world in this way.

CÆSTUS, in antiquity, a large gantlet made of raw hide, which the wrestlers made use of when they fought at the public games.—This was a kind of leathern strap, strengthened with lead, or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts, as to enforce their blows.

CÆSTUS, or *Cæstum*, was also a kind of girdle, made of wool, which the husband untied for his spouse the first day of marriage, before they went to bed.

This relates to *Venus's* girdle, which *Juno* borrowed of her to entice *Jupiter* to love her. See *Cæstus*.

CÆSURA, in the ancient poetry, is when, in the scanning of a verse, a word is divided so, as one part seest cut off, and goes to a different foot from the rest; as,

Mentis ri noli, nunquam men[da]cia profunt.

where the syllables *ri*, *li*, *quam*, and *men*, are *cæsuras*.

CÆSURE, in the modern poetry, denotes a rest, or pause, towards the middle of an *Alexandrian* verse, by which the voice and pronunciation are aided, and the

† See *Parfe*, verse, as it were, divided into two hemistichs †.

CÆTERIS PARIBUS, a Latin term in frequent use among mathematical and physical writers. The words literally signify, *the rest* (or other things) being alike or equal. Thus we say, the heavier the bullet, *cæteris paribus*, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way, we say, the velocity and quantity circulating in a given time through any section of an artery, will, *cæteris paribus*, be according to its diameter, and nearness to or distance from the heart.

CÆTOBRIX (anc. geog.), a town of Lusitania, near the mouth of the *Tagus* on the east tide; now extinct. It had its name from its fishery; and there are still extant fish-ponds on the shore, done with plaster of Paris, which illustrate the name of the ruined city.

CAFFA, in commerce, painted cotton-cloths manufactured in the East Indies, and sold at Bengal.

CAFFA, or *Kassa*, a city and port-town of Crim Tartary, situated on the south-east part of that peninsula. E. Long. 37. o. N. Lat. 44. 55.

It is the most considerable town in the country, and gives name to the straits of *Cassa*, which run from the *Euxine* or *Black Sea*, to the *Palus Meotis*, or sea of *Azoph*.

CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the dominions of the *Grand Mogul*, and through other countries on the continent of the East Indies.

The *Caffila* differs from a caravan, at least in *Perfia*: for the *cassila* belongs properly to some sovereign, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. The English and Dutch have each of them their *cassila* at *Gambrow*. There are also such *cassilas*, which cross some parts of the deserts of Africa, particularly that called the *sea of sand*, which lies between the kingdom of Morocco, and those of *Tombut* and *Gaigo*. This is a journey of 400 leagues; and takes up two months in going, and as many in coming back; the *cassila* travelling only by night, on account of the excessive heat of that country. The chief merchandize they bring back consists in gold dust, which they call *atibar*, and the Europeans *tibir*.

CAFFILA on the coast of *Guzerat* or *Cambaya*, signifies a small fleet of merchant-ships.

CAFFRARIA, the country of the *Cassers*, or *Hot-tentents*, in the most southerly part of Africa, lying in the form of a crescent about the inland country of *Monomopata*, between 35° south latitude and the tropic of *Capricorn*; and bounded on the east, south, and west, by the Indian and Atlantic oceans.

Most of the sea-coasts of this country are subject to the Dutch, who have built a fort near the most southern promontory, called the *Cape of Good-Hope* *.

* See *Hutchinson*.

CAG, or *KEG*, a barrel or vessel, that contains from four to five gallons.

CAGE, an inclosure made of wire, wicker, or the like, interwoven lattice-wise, for the confinement of birds, or wild beasts.

The cage, in the Roman amphitheatres, was a place wherein savage animals were confined. It was inclosed with iron rails, and open at top, so as to be seen to the bottom by the spectators.

CAGEAN, or *CAGAYAN*, a province of the island of *Lutzen*, or *Manila*, in the East Indies. It is the largest in the island, being 80 leagues in length, and 40 in breadth. The principal city is called *New Segovia*, and 15 leagues eastward from this city lies *cape Bajador*. Doubling that cape, and coasting along 20 leagues from north to south, the province of *Cagayan* ends, and that of *Illocos* begins. The peaceable *Cagayans* who pay tribute are about 9000; but there are a great many not subdued. The whole province is fruitful: the men apply themselves to agriculture, and are of a martial disposition; and the women apply to several works in cotton. The mountains afford food for a vast number of bees; in consequence of which wax is so plenty, that all the poor burn it instead of oil. They make their candles after the following manner: they leave a small hole at each end of a hollow stick for the wick to run through; and then, stopping the bottom, fill it with wax at the top: when cold, they break the mould, and take out the candle. On the mountains there is abundance of brass, ebony, and other

ther valuable woods. In the woods are store of wild bealts, as boars; but not so good as those of Europe. There are also abundance of deer, which they kill for their skins and horns to sell to the Chinese.

CAGLI, an ancient episcopal town of Italy, in the duchy of Urbino, situated at the foot of the Apennine mountains. E. Long. 14. 12. N. Lat. 43. 30.

CAGLIARI (Paul), an excellent painter, born at Verona in the year 1532. Gabriel Cagliari his father was a sculptor, and Antonio Badile his uncle was his master in painting. He was not only esteemed the best of all the Lombard painters, but for his extensive talents in the art was peculiarly styled *Il pittor felice*, "the happy painter;" and there is scarcely a church in Venice where some of his performances are not to be seen. He died of a fever at Venice in 1588, and had a tomb and a statue of brass erected to his memory in the church of St Sebastian. He left great wealth to his two sons Gabriel and Charles, who lived happily together, and joined in finishing several of their father's imperfect pieces with good success.

CAGLIARI, an ancient, large, and rich town, capital of the island of Sardinia in the Mediterranean. It is seated on the declivity of an hill, is an university, an archbishopric, and the residence of the viceroy. It has an excellent harbour, and a good trade; but is a place of no great strength. It was taken, with the whole island, by the English in 1708, who transferred it to the emperor Charles VI.; but it was retaken by the Spaniards in 1717, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, and hence he has the title of *king of Sardinia*. E. Long. 9. 14. N. Lat. 39. 12.

CAGUI, in zoology, a synonyme of two species of monkeys, viz. the jactus, and ædipus. See SIMIA.

CAHORS, a considerable town of France, in Querci in Guienne, with a bishop's see and an university. It is seated on a peninsula made by the river Lot, and built partly on a craggy rock. The principal street is very narrow; and terminates in the market-place, in which is the town-houle. The cathedral is a Gothic structure, and has a large square steeple. The fortifications are regular, and the town is surrounded with thick walls. E. Long. 1. 6. N. Lat. 44. 26.

CAHYS, a dry measure for corn, used in some parts of Spain, particularly at Seville and at Cadiz. It is near a bushel of our measure.

CAJANABURG, the capital of the province of Cajania or East Bothnia in Sweden, situated on the north-east part of the lake Cajania, in E. Long. 27. 0. N. Lat. 63. 50.

CAIAPHAS, high-priest of the Jews after Simon, condemned Christ to death; and was put out of his place by the emperor Vitellius, for which disgrace he made away with himself.

CAJAZZO, a town of the province of Lavoro in the kingdom of Naples, situated in E. Long. 15. 0. N. Lat. 41. 15.

CAICOS, the name of some American islands to the north of St Domingo, lying from W. Long. 112. 10. to 113. 16. N. Lat. 21. 40.

CAJPUT, an oil brought from the East Indies resembling that of cardamoms.

CAIETA, (anc. geog.), a port and town of Latium, so called from Æneas's nurse; now *Gaeta*, which see.

CAJETAN (Cardinal), was born at Cajeta in the kingdom of Naples in the year 1469. His proper name was *Thomas de Vio*; but he adopted that of *Cajetan* from the place of his nativity. He defended the authority of the Pope, which suffered greatly at the council of Nice, in a work entitled *Of the power of the Pope*; and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palermo, and in 1517 was made a cardinal by Pope Leo X. The year after, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther; but Luther, under protection of Frederic elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons in repairing to Augsborg, yet he rendered all his proceedings ineffectual. Cajetan was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1534. He wrote Commentaries upon Aristotle's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

CAIPONG, a large, populous, and rich town of Asia, in China, seated in the middle of a large and well cultivated plain. It stands in a bottom; and when besieged by the rebels in 1642, they ordered the dykes of the river Hohangho to be cut, which drowned the city, and destroyed 300,000 of its inhabitants. E. Long. 113. 27. N. Lat. 35. 0.

CAILLE (Nicholas Louis de la), an eminent mathematician and astronomer, was born at a small town in the diocese of Rheims in 1713. His father had served in the army, which he quitted, and in his retirement studied mathematics; and amused himself with mechanic exercises, wherein he proved the happy author of several inventions of considerable use to the public. Nicholas, almost in his infancy, took a fancy to mechanics, which proved of signal service to him in his maturer years. He was sent young to school at Mantes-sur-Seine, where he discovered early tokens of genius. In 1729, he went to Paris; where he studied the classics, philosophy, and mathematics. Afterwards he went to study divinity at the college de Navarre, proposing to embrace an ecclesiastical life. At the end of three years he was ordained a deacon, and officiated as such in the church of the college de Mazarin several years; but he never entered into priests orders, apprehending that his astronomical studies, to which he became most assiduously devoted, might too much interfere with his religious duties. In 1739, he was conjoined with M. de Thury, son to M. Cassini, in verifying the meridian of the royal observatory through the whole extent of the kingdom of France. In the month of November the same year, whilst he was engaged day and night in the operations which this grand undertaking required, and at a great distance from Paris, he was, without any solicitation, elected into the vacant mathematical chair which the celebrated M. Varignon had so worthily filled. Here he began to teach about the end of 1740; and an observatory was ordered to be erected for his use in the college, and furnished with a suitable apparatus of the best instruments. In May 1741, M. de la Caille was admitted into the royal academy of sciences as an adjoint member for astronomy. Besides the many excellent papers of his dispersed up and down in their memoirs, he published Elements of geometry, metha-

Caille.

Caille,
Caimacan.

nics, optics, and astronomy. Moreover, he carefully computed all the eclipses of the sun and moon that had happened since the Christian æra, which were printed in a book published by two Benedictines, entitled *L'art de vérifier les dates*, &c. Paris, 1750, in 4to. Besides these, he compiled a volume of astronomical ephemerides for the years 1745 to 1755; another for the years 1755 to 1765; a third for the years 1765 to 1775; an excellent work entitled *Astronomie fundamenta novissimis solis et stellarum observationibus stabilita*; and the most correct solar tables that ever appeared. Having gone through a seven years series of astronomical observations in his own observatory, he formed a project of going to observe the southern stars at the Cape of Good Hope. This was highly approved by the academy, and by the prime minister Comte de Argenson, and very readily agreed to by the states of Holland. Upon this, he drew up a plan of the method he proposed to pursue in his southern observations; setting forth, that, besides settling the places of the fixed stars, he proposed to determine the parallax of the moon, Mars, and Venus. But whereas this required correspondent observations to be made in the northern parts of the world, he sent to those of his correspondents who were expert in practical astronomy previous notice, in print, what observations he designed to make at such and such times for the said purpose. At length, on the 21st of November 1750, he sailed for the Cape, and arrived there on the 19th of April 1751. He forthwith got his instruments on shore; and, with the assistance of some Dutch artificers, set about building an astronomical observatory, in which his apparatus of instruments was properly disposed of as soon as it was in a fit condition to receive them.

The sky at the Cape is generally pure and serene, unless when a south-east wind blows. But this is often the case; and when it is, it is attended with some strange and terrible effects. The stars look bigger, and seem to caper; the moon has an undulating tremor; and the planets have a sort of beard like comets. Two hundred and twenty-eight nights did our astronomer survey the face of the southern heavens; during which space, which is almost incredible, he observed more than 10,000 stars; and whereas the ancients filled the heavens with monsters and old-wives tales, the abbe de la Caille chose rather to adorn them with the instruments and machines which modern philosophy has made use of for the conquest of nature*. With no less success did he attend to the parallax of the moon, Mars, Venus, and the sun. Having thus executed the purpose of his voyage, and no present opportunity offering for his return, he thought of employing the vacant time in another arduous attempt; no less than that of taking the measure of the earth, as he had already done that of the heavens. This indeed had, through the munificence of the French king, been done before by different sets of learned men both in Europe and America; some determining the quantity of a degree under the equator, and others under the arctic circle: but it had not as yet been decided whether in the southern parallels of latitude the same dimensions obtained as in the northern. His labours were rewarded with the satisfaction he wished for; having determined a distance of 410,814 feet from a place called *Klip-Fonteyn* to the Cape, by means of a base of 38,802 feet, three times actually measured; whence he

discovered a new secret of nature, namely, that the radii of the parallels in south latitude are not the same as those of the corresponding parallels in north latitude. About the 23^d degree of south latitude he found a degree on the meridian to contain 342,222 Paris feet. He returned to Paris the 27th of September 1754; having in his almost four years absence expended no more than 9144 livres on himself and his companion; and at his coming into port, he refused a bribe of 100,000 livres, offered by one who thirsted less after glory than gain, to be sharer in his immunity from custom-house searches.

After receiving the congratulatory visits of his more intimate friends and the astronomers, he first of all thought fit to draw up a reply to some strictures which professor Euler had published relative to the meridian, and then he settled the results of the comparison of his own with the observations of other astronomers for the parallaxes. That of the sun he fixed at 9³''; of the moon, at 56' 56''; of Mars in his opposition, 36''; of Venus, 38''. He also settled the laws whereby astronomical refractions are varied by the different density or rarity of the air, by heat or cold, and dryness or moisture. And, lastly, he shewed an easy, and by common navigators practicable, method of finding the longitude at sea by means of the moon, which he illustrated by examples selected from his own observations during his voyages. His fame being now established upon to firm a basis, the most celebrated academies of Europe claimed him as their own: and he was unanimously elected a member of the royal society at London; of the institute of Bologna; of the imperial academy at Peterburg; and of the royal academies of Berlin, Stockholm, and Gottingen. In the year 1760, Mr de la Caille was attacked with a severe fit of the gout; which, however, did not interrupt the course of his studies; for he then planned out a new and immense work, no less than a history of astronomy through all ages, with a comparison of the ancient and modern observations, and the construction and use of the instruments employed in making them. In order to pursue the task he had imposed upon himself in a suitable retirement, he obtained a grant of apartments in the royal palace of Vincennes; and whilst his astronomical apparatus was erecting there, he began printing his Catalogue of the southern stars, and the third volume of his Ephemerides. The state of his health was, towards the end of the year 1763, greatly reduced. His blood grew inflamed; he had pains of the head, obstructions of the kidneys, loss of appetite, with an op-pletion of the whole habit. His mind remained unaffected, and he resolutely persisted in his studies as usual. In the month of March, medicines were administered to him, which rather aggravated than alleviated his symptoms; and he was now sensible, that the same distemper which in Africa, ten years before, yielded to a few simple remedies, did in his native country bid defiance to the best physicians. This induced him to settle his affairs: his manuscripts he committed to the care and discretion of his esteemed friend M. Maraldi. It was at last determined that a vein should be opened; but this brought on an obstinate lethargy, of which he died, aged 49.

C AIMACAN, or CAIMACAM, in the Turkish affairs, a dignity in the Ottoman empire, answering to lieuten-

ANT,

* See the
Planisphere
in his *Cælem
australe stel-
lyscum*.

Calman
Cairo.

nant, or rather deputy, amongst us.

There are usually two caimacans; one residing at Constantinople, as governor thereof; the other attending the grand vizir in quality of his lieutenant, secretary of state, and first minister of his council, and gives audience to ambassadors. Sometimes there is a third caimacan, who attends the sultan; whom he acquaints with any public disturbances, and receives his orders concerning them.

CAIMAN ISLANDS, certain American islands lying south of Cuba, and north-west of Jamaica, between 81° and 86° of west longitude, and in 21° of north latitude. They are most remarkable on account of the fishery of tortoise, which the people of Jamaica catch here, and carry home alive, keeping them in pens for food, and killing them as they want them.

CAIN, eldest son of Adam and Eve, killed his brother Abel; for which he was condemned by God to banishment and a vagabond state of life. Cain retired to the land of Nod, on the east of Eden; and built a city, to which he gave the name of his son Enoch.

CAINITES, a sect of heretics in the 2^d century, so called on account of their great respect for Cain. They pretended that the virtue which produced Abel was of an order inferior to that which had produced Cain, and that this was the reason why Cain had the victory over Abel and killed him; for they admitted a great number of geni, which they called *virtues*, of different ranks and orders. They made profession of honouring those who carry in Scripture the most visible marks of reprobation; as the inhabitants of Sodom, Esau, Korah, Dathan, and Abiram. They had, in particular, a very great veneration for the traitor Judas, under pretence that the death of Jesus Christ had saved mankind. They had a forged gospel of Judas, to which they paid great respect.

CAIRNS, the vulgar name of those heaps of stones which are to be seen in many places of Britain, Scotland especially: they were undoubtedly raised in honour of the dead, as appears from the bones and ashes deposited in urns which have been frequently found in them. See ARRAN, n^o 12.; and BARROWS.

CAIRO, or GRAND CAIRO, the capital of Egypt, situated in a plain at the foot of a mountain, in E. Long. 32. o. N. Lat. 30. o. It was founded by Jawhar, a Magrebian general, in the year of the Hegira 358. He had laid the foundations of it under the horoscope of Mars; and for that reason gave his new city the name of *Al Kabirah*, or the *Victorious*, an epithet applied by the Arab astronomers to that planet. In 362, it became the residence of the khalifs of Egypt, and of consequence the capital of that country, and has ever since continued to be so. It is divided into the New and Old cities. Old Cairo is on the eastern side of the river Nile, and is now almost uninhabited. The New, which is properly Cairo, is seated in a sandy plain, about two miles and a half from the old city. It stands on the western side of the Nile, from which it is not three quarters of a mile distant. It is extended along the mountain on which the castle is built, for the sake of which it was removed hither, in order, as some pretend, to be under its protection. However, the change is much for the worse, as well with regard to air as water, and the pleasantness of the prospect. Bulack may be called the port of Cairo; for it

stands on the bank of the Nile, about a mile and a half from it, and all the corn and other commodities are landed there before they are brought to the city. Some travellers have made Cairo of a most enormous magnitude, by taking in the old city Bulack, and the new; the real circumference of it, however, is not above ten miles, but it is extremely populous. The first thing that strikes a traveller is the narrowness of the streets, and the appearance of the houses. These are so daubed with mud on the outside, that you would think they were built with nothing else. Besides, as the streets are unpaved, and always full of people, the walking in them is very inconvenient, especially to strangers. To remedy this, there are a great number of asses, which always stand ready to be hired for a trifle, that is, a penny a mile. The owners drive them along, and give notice to the crowd to make way. And here it may be observed, that the Christians in this, as well as other parts of the Turkish dominions, are not permitted to ride upon horses. The number of the inhabitants can only be guessed at; but we may conclude it to be very great, because, in some years, the plague will carry off 200,000, without their being much missed. The houses are from one to two or three stories high, and flat at the top; where they take the air, and often sleep all night. The better sort of these have a court on the inside like a college. The common run of houses have very little room, and even among great people it is usual for 20 or 30 to lie in the same hall. Some houses will hold 300 persons of both sexes, among whom are 20 or 30 slaves, and those of ordinary rank have generally three or four.

There is a canal called *Halis*, which runs along the city from one end to the other, with houses on each side, which make a large straight street. Besides this, there are several lakes, which are called *hirks* in the language of the country. The principal of these, which is near the castle, is 500 paces in diameter. The most elegant houses in the city are built on its banks; but what is extraordinary, eight months in the year it contains water, and the other four it appears with a charming verdure. When there is water sufficient, it is always full of gilded boats, barges, and barks, in which people of condition take their pleasure towards night, at which time there are curious fire-works, and variety of music.

New Cairo is surrounded with walls built with stone, on which are handsome battlements, and at the distance of every hundred paces there are very fine towers, which have room for a great number of people. The walls were never very high, and are in many places gone to ruin. The basha lives in the castle, which was built by Saladin seven hundred years ago. It stands in the middle of the famous mountain Moketan, which terminates in this place, after it had accompanied the Nile from Ethiopia hither. This castle is the only place of defence in Egypt; and yet the Turks take no notice of its falling, inasmuch that in process of time it will become a heap of rubbish. The principal part in it is a magnificent hall, environed with 12 columns of granite, of a prodigious height and thickness, which sustain an open dome, under which Saladin distributed justice to his subjects. Round this dome there is an inscription in relief, which determines the date and by whom it was built. From this place the whole

whole city of Cairo may be seen, and above 30 miles along the Nile, with the fruitful plains that lie near it, as well as the mosques, pyramids, villages, and gardens, with which these fields are covered. These granite pillars were the work of antiquity, for they were got out of the ruins of Alexandria. There are likewise in the mosques and in the principal houses no less than 40,000 more, besides great magazines, where all kinds are to be had at very low rates. A janitary happened to find five in his garden, as large as those in the castle; but could not find any machine of strength sufficient to move them, and therefore had them sawed in pieces to make mill-stones. It is believed that there have been 30 or 40,000 of these pillars brought from Alexandria, where there are very many more to be had. The gates of Cairo are three, which are very fine and magnificent.

There are about 300 public mosques in this city, some of which have six minarets. The mosque of A-shar hath several buildings adjoining, which were once a famous university, and 14,000 scholars and students were maintained on the foundation; but has now not above 1400, and those are only taught to read and write. All the mosques are built upon the same plan, and differ only in magnitude. The entrance is thro' the principal gate into a large square, open on the top, but well paved. Round this are covered galleries, supported by pillars; under which they say their prayers, in the shade. On one side of the square there are particular places with basins of water, for the convenience of performing the ablutions enjoined by the Koran. The most remarkable part of the mosque, besides the minaret, is the dome. This is often bold, well proportioned, and of an astonishing magnitude. The inside stones are carved like lace, flowers, and melons. They are built so firm, and with such art, that they will last 600 or 700 years. About the outward circumference there are large Arabic inscriptions, in relief, which may be read by those who stand below, though they are sometimes of a wonderful height.

The khanes or caravanseras are numerous and large, with a court in the middle, like their houses. Some are several stories high, and are always full of people and merchandise. The Nubians, the Abyssinians, and other African nations, which come to Cairo, have one to themselves, where they always meet with lodging. Here they are secure from insults, and their effects are all safe. Besides these, there is a bazar, or market, where all sorts of goods are to be sold. This is in a long broad street; and yet the crowd is so great, you can hardly pass along. At the end of this street is another short one, but pretty broad, with shops full of the best sort of goods, and precious merchandise. At the end of this short street there is a great khane, where all sorts of white slaves are to be sold. Farther than this is another khane, where a great number of lasses, of both sexes, are exposed to sale. Not far from the best market-place is an hospital, and a mosque for mad people. They also receive and maintain sick people into this hospital, but they are poorly looked after.

Old Cairo has scarce any thing remarkable but the granaries of Joseph; which are nothing but a high wall, lately built, which includes a square spot of ground, where they deposit wheat, barley, and other

grain, which is a tribute to the basha, paid by the owners of land. This has no other covering but the heavens, and therefore the birds are always sure to have their share. There is likewise a tolerably handsome church, which is made use of by the Copts, who are Christians and the original inhabitants of Egypt. Joseph's well is in the castle, and was made by king Mohammed about 700 years ago. It is called *Joseph's well*, because they attribute every thing extraordinary to that remarkable person. It is cut in a rock, and is 280 feet in depth. The water is drawn up to the top by means of oxen, placed on platforms, at proper distances, which turn about the machines that raise it. The descent is so sloping, that, though there are no steps, the oxen can descend and ascend with ease.

The river Nile, to which not only Cairo but all Egypt is so much indebted, is now known to have its rise in Abyssinia. The increase of the Nile generally begins in May, and in June they commonly proclaim about the city how much it is risen. Over against old Cairo the basha has a house, wherein the water enters to a column, which has lines at the distance of every inch, and marks at every two feet as far as 30. When the water rises to 22 feet, it is thought to be of a sufficient height; when it rises much higher, it does a great deal of mischief. There is much pomp and ceremony used in letting the water into the canal, or hali, above-mentioned. The basha gives the first stroke towards the removal of the dike or dam. When the water has filled the canal and lakes in the city, and the numerous cisterns that are in the mosques and private houses, it is let into a vast plain, to the north-east; the extent of which is 50 miles. When the country is covered with water, it is no unpleasant sight to view the towns appearing like little islands, and the people passing and repassing in boats.

The inhabitants of Cairo, are a mixture of Moors, Turks, Jews, Greeks, and Copts, or Coptis. The only difference between the habit of the Moors and Coptis is their turbans; those of the Moors being white, and of the Coptis white striped with blue. The common people generally wear a long black loose frock, sewed together all down before. The Jews wear a frock of the same fashion, made of cloth; and their caps are like a high crowned hat, without brims, covered with the same cloth, but not so taper. The Jewish womens' are not very unlike the mens, but more light and long. The Greeks are habited like the Turks, only their turbans differ.

Provisions of all kinds are exceeding plenty; for 20 eggs may be bought for a parrah or penny, and bread is six times as cheap as with us. They have almost all sorts of flesh and fish; and in particular have tame buffaloes, which are very useful. They bring goats into the streets in great numbers, to sell their milk. Their gardens are well stocked with fruit-trees of various kinds, as well as roots, herbs, melons, and cucumbers. The most common flesh meat is mutton. The goats are very beautiful, and have ears two feet in length; but their flesh is in no great esteem.

CAIROAN, or CAIRWAN, a city of Africa, in the kingdom of Tunis, seated in a sandy barren soil, about five miles from the gulph of Capres. It has neither spring, well, nor river; for which reason they are obliged

Caithness,
Caithness.

* See *Bur-*
bury, n^o 24,
et seq.

liged to preserve rain-water in tanks and cisterns. It was built by the Aglabites; and is the ancient Cyrene*, but hath now lost its splendor. There is still, however, a very superb mosque, and the tombs of the kings of Tunis are yet to be seen. E. Long. 9. 12. N. Lat. 35. 40.

CAISSON, in the military art, a wooden chest, into which several bombs are put, and sometimes filled only with gunpowder: this is buried under some work whereof the enemy intend to possess themselves, and, when they are masters of it, is fired, in order to blow them up.

CAISSON is also used for a wooden frame or chest used in laying the foundations of the piers of a bridge.

CAITHNESS, otherwise called the *shire of Weick*, is the most northern county of all Scotland; bounded on the east by the ocean, by Strathnaver and Sutherland on the south and south-west: from thence it is divided by the mountain Orde, and a continued ridge of hills as far as Knockfin, then by the whole course of the river Hallowdale. On the north it is washed by the Pentland or Putland frith, which flows between this county and the Orkneys. It extends 35 miles from north to south, and about 20 from east to west. The coast is rocky, and remarkable for a number of bays and promontories. Of these, the principal are Sand-side-head to the west, pointing to the opening of Pentland frith; Orcas, now Holborn-head, and Dunnot-head, both pointing northward to the frith. Dunnot-head is a peninsula about a mile broad, and seven in compass; affording several lakes, good pasture, excellent mill-stones, and a lead-mine. Scribsterbay, on the north-west, is a good harbour, where ships may ride securely. Rice-bay, on the east side, extends three miles in breadth; but is of dangerous access, on account of some sunk rocks at the entrance. At the bottom of this bay appear the ruins of two strong castles, the seat of the earl of Caithness, called *Castle Sinclair*, and Gernego, joined to each other by a draw-bridge. Duncan's bay, otherwise called *Dunthy-head*, is the north-east point of Caithness, and the extremest promontory in Britain. At this place, the breadth of the frith does not exceed 12 miles, and in the neighbourhood is the ordinary ferry to the Orkneys. Here is likewise Clythe's pointing east, and Noshead pointing north-east. The sea in this place is very impetuous, being in continual agitation from violent counter-tides, currents, and vortices. The only island belonging to this county is that of Stroma, in the Pentland frith, at the distance of two miles from the main land, extending about a mile in length, and producing good corn. The navigation is here rendered very difficult by conflicting tides and currents, which at both ends of the island produce a great agitation in the sea. At the south end, the waves dance so impetuously, that the sailors term them the *merry men of May*, alluding to the house of one Mr May, on the opposite shore of Caithness, which served them as a land-mark, in the dangerous passage between the island and the continent. The property of this island was once disputed between the earls of Orkney and Caithness; but adjudged to the latter, in consequence of an experiment, by which it appeared, that venomous creatures will live in Stroma, whereas they die immediately if transported to the Orkneys. The county of Caithness, though chiefly mountainous,

flattens towards the sea-coast, where the ground is arable, and produces good harvests of oats and barley, sufficient for the natives, and yielding a superplus for exportation; but the soil being generally a moist clay, and the climate cold, the harvest is late, and the corn counted inferior in quality to that which is raised in the neighbouring counties. Indeed, the country is better adapted for pasture, and as such is turned to the best advantage. Caithness is well watered with small rivers, brooks, lakes, and fountains, and affords a few woods of birch, but is in general bare of trees; and even those the inhabitants plant, are stunted in their growth. Lead is found at Dennet, copper at Old-Urk, and iron ore at several places; but these advantages are not improved. The air of Caithness is temperate, tho' in the latitude of 58, where the longest day in summer is computed at 18 hours; and when the sun sets, he makes so small an arch of a circle below the horizon, that the people enjoy a twilight until he rises again. The fuel used by the inhabitants of Caithness consists of peat and turf, which the ground yields in great plenty. The forest of Moravins and Berridale afford abundance of red deer and roe-bucks: the country is well stored with hares, rabbits, growse, heathcocks, plover, and all sorts of game, comprehending a bird called *snow-fleet*, about the size of a sparrow, exceedingly fat and delicious, that comes hither in large flights about the middle of February, and takes its departure in April. The hills are covered with sheep and black cattle; so numerous, that a fat cow has been sold at market for 4 s. sterling. The rocks along the coasts are frequented by eagles, hawks, and all manner of sea-fowl, whose eggs and young are taken in vast quantities by the natives. The rivers and lakes abound with trout, salmon, and eels; and the sea affords a very advantageous fishery. Divers obelisks and ancient monuments appear in this district, and several Romish chapels are still standing. Caithness is well peopled with a race of hardy inhabitants, who employ themselves chiefly in fishing, and breeding sheep and black cattle: they are even remarkably industrious; for between Weick and Dumbith, one continued track of rugged rocks, extending 12 miles, they have forced several little harbours for their fishing boats, and cut artificial steps from the beach to the top of the rocks, where they have erected houses, in which they cure and dry the fish for market.

According to Mr Pennant, this county is supposed to send out in some years 2200 head of black cattle, but in bad seasons the farmer kills and sells great numbers for sale. Great numbers of swine are also reared here. These are short, high-backed, long bristled, sharp, slender, and long-nosed; have long erect ears, and moist savage looks. Here are neither barns nor granaries: the corn is threshed out, and preserved in the chaff in byks; which are stacks, in the shape of beehives, thatched quite round, where it will keep good for two years. Vast numbers of salmon are taken at Castle-hill, Dunet, Wick, and Thurso. A miraculous draught at this last place is still talked of, not less than 2500 being taken at one tide within the memory of man; and Mr Smollet informs us, that, in the neighbourhood, above 300 good salmon have been taken at one draught of the net. In the month of November, great numbers of seals are taken in the caverns that o-

Caithness.

Calthnefs,
Caius.

Calus
||
Calabria.

pen into the sea, and run some hundreds of yards under ground. The entrance of these caverns is narrow, but the inside lofty and spacious. The seal-hunters enter these in small boats with torches, which they light as soon as they land, and then with loud shouts alarm the animals, which they kill with clubs as they attempt to pass. This is a hazardous employment; for should the wind blow hard from sea, these adventurers are inevitably lost. Sometimes a large species of seals, 12 feet long, have been killed on this coast; and it is said the same kind are found on the rock Hiskir, one of the western islands. During the spring, great quantities of lump-fish resort to this coast, and are the prey of the seals, as appears from the number of skins of those fishes which at that season float ashore. At certain times, also, the seals seem to be visited by a great mortality; for, at those times, multitudes of them are seen dead in the water. Much limestone is found in this country, which when burnt is made into a compost with turf and sea-plants. The common people are kept in great servitude, and most of their time is given to the lairds, an invincible impediment to the prosperity of the country. The women are also condemned to a shameful drudgery; it not being uncommon to see them trudging in droves of 60 or 70 to the fields with baskets of dung on their backs, which are filled at pleasure from the dunghills by their lords and masters with their pitchforks.

The last private war in Scotland was occasioned by a dispute relating to this country. An earl of Breckinbarne married an heiress of Calthnefs: the inhabitants would not admit her title, but set up another person in opposition. The earl, according to the custom of those times, designed to assert his right by force of arms: he raised an army of 1500 men; but thinking the number too great, he dismissed first one 500, and then another. With the remainder he marched to the borders of Calthnefs. Here he thought proper to add stratagem to force. He knew that the enemy's army waited for him on the other side of the promontory of Ord. He knew also, that whisky was then the nectar of Calthnefs; and therefore ordered a ship laden with that precious liquor to pass round, and wilfully strand itself on the shore. The directions were punctually obeyed; and the crew in a seeming fright elapsed in the boats to the invading army. The Calthnefs men made a prize of the ship; but making too free with the freight, became an easy prey to the earl, who attacked them during their intoxication, and gained the country, which he disposed of very soon after his conquest.

CAIUS, KAYE, or KAYE, (Dr John), the founder of Caius college in Cambridge, was born at Norwich in 1510. He was admitted very young a student in Gonville-hall in the above-mentioned university; and at the age of 21 translated from Greek into Latin some pieces of divinity, and into English Erasmus's paraphrase on Jude, &c. From these his juvenile labours, it seems probable that he first intended to prosecute the study of divinity. Be that as it may, he travelled to Italy, and at Padua studied physic under the celebrated Montanus. In that university he continued some time, where we are told he read Greek lectures with great applause. In 1543, he travelled through part of Italy, Germany, and France; and returning to England commenced doctor of physic at Cambridge. He practised

first at Shrewsbury, and afterwards at Norwich; but removing to London, in 1547, he was admitted fellow of the college of physicians, to which he was several years president. In 1557, being then physician to queen Mary, and in great favour, he obtained a licence to advance Gonville-hall, where he had been educated, into a college; which he endowed with several considerable estates, adding an entire new square at the expense of 1834*l*. Of this college he accepted the mastership, which he kept till within a short time of his death. He was physician to Edward VI. queen Mary, and queen Elizabeth. Towards the latter end of his life he retired to his own college at Cambridge; where, having resigned the mastership to Dr Legge of Norwich, he spent the remainder of his life as a fellow-commoner. He died in July 1573, aged 63; and was buried in the chapel of his own college. Dr Caius was a learned, active, benevolent man. In 1557, he erected a monument in St Paul's to the memory of the famous Linacre. In 1563, he obtained a grant for the college of physicians to take the bodies of two malefactors annually for dissection; and he was the inventor of the *insignia* which distinguish the president from the rest of the fellows. He wrote, 1. *Annals of the college from 1555 to 1572*. 2. *Translation of several of Galen's works*. Printed at different times abroad. 3. *Hippocrates de medicamentis*, first discovered and published by our author; also *De ratione victus*, Lov. 1556, 8vo. 4. *De medendi methodo*. Basil 1544, Lond. 1556, 8vo. 5. *Account of the sweating sickness in England*. Lond. 1556, 1721. It is entitled *De ephemera Britannica*. 6. *History of the university of Cambridge*. Lond. 1568, 8vo. 1574, 4to. in Latin. 7. *De thermis Britannicis*. Doubtful whether ever printed. 8. *Of some rare plants and animals*. Lond. 1570. 9. *De canibus Britannicis*, 1570, 1729. 10. *De pronunciatione Græcæ et Latine linguae*. Lond. 1574. 11. *De libris propriis*. Lond. 1570. Besides many other works which never were printed.

CAKET, a town of Asia, in Persia, in the province of Gurgistan near Mount Caucasus. Its trade consists chiefly in silks. E. Long. 46. 15. N. Lat. 43. 32.

CALABASH, in commerce, a light kind of vessel formed of the shell of a gourd, emptied and dried, serving to put divers kinds of goods in, as pitch, rosin, and the like. The word is Spanish, *Calabaca*, which signifies the same. The Indians also, both of the North and South Sea, put the pearls they have fished in calabashes, and the negroes on the coast of Africa do the same by their gold-dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans. The same vessels likewise serve for putting in liquors; and do the office of cups, as well as bottles, for soldiers, pilgrims, &c.

CALABASH-Tree, in botany. See CRESCENTIA.

African CALABASH-Tree. See BABAB.

CALABRIA, a country of Italy, in the kingdom of Naples, divided into Calabria Ultra, and Calabria Citra, commonly called *Uterior* and *Citerior*, or *Farther* and *Hither Calabria*. Calabria Citerior is one of the 12 provinces of the kingdom of Naples; and bounded on the south by Calabria Ultra, on the north by Basilicata, and on the west and east by the sea: Cosenza is the capital. Calabria Ultra is washed by the Medi-

Calade
Calamine.

Mediterranean sea on the east, south, and west, and bounded by Calabria Citra on the north. Reggio is the capital town.

CALADE, in the menage, the descent or sloping declivity of a rising menage ground, being a small eminence, upon which we ride down a horse several times, putting him to a short gallop, with his fore-hams in the air, to learn him to ply or bend his haunches, and form his stop upon the aids of the calves of the legs, the stay of the bridle, and the cavesson seasonably given.

CALAGORINA, or CALAGURIS, distinguished by the surname *Nafica*, (anc. geog.), a city of the Vascones in the Hither Spain; now *Calaborra*. See the following article.

CALAHORRA, an episcopal town of Spain, in Old Castile, seated in a fertile soil, on the side of a hill which extends to the banks of the river Ebro. W. Long. 2. 7. N. Lat. 42. 12.

CALAIS, a strong town of France, in Lower Picardy, with a citadel and a fortified harbour. It is built in the form of a triangle, one side of which is towards the sea. The citadel is as large as the town, and has but one entrance. It is a trading place, with handsome streets, and several churches and monasteries; the number of inhabitants is reckoned to be 4000. It was taken by king Edward III. in 1347; and was lost in queen Mary's time, in 1557. It was bombarded by the English in 1696, without doing much damage. The fortifications are good; but its greatest strength is its situation among the marshes, which may be overflowed at the approach of an enemy. The harbour is not so good as formerly, nor will it admit vessels of any great burden. In times of peace, there are packet-boats going backward and forward twice a-week from Dover to Calais, which is 21 miles distant. E. Long. 2. 6. N. Lat. 50. 58.

CALAIS and Zetes, in fabulous history, sons of Boreas and Orithia, to whom the poets attributed wings: they went on the voyage of Colchis with the Argonauts, delivered Phineus from the harpies, and were slain by Hercules.

CALAMANCO, a sort of woollen stuff manufactured in England and Brabant. It has a fine gloss; and is checkered in the warp, whence the checks appear only on the right side. Some calamaucos are quite plain, others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

CALAMARIE, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnaeus; in which he has the following genera, viz. bobartia, scirpus, cyperus, eriophorum, carex, schenus, flagellaria, juncus. See BOTANY, sect. vi. 3.

CALAMATA, a considerable town of Turkey in Europe, in the Morea, and province of Belvedera. It was taken by the Venetians in 1685; but the Turks retook it afterwards with all the Morea. It stands on the river Spinarza, eight miles from the sea. E. Long. 22. 15. N. Lat. 37. 8.

CALAMINE, CALAMY, *Lapis Calaminaris*, or *Cadmia Fossilis*, a sort of stone or mineral, containing zinc, iron, and sometimes other substances. It is considerably heavy, and the more so the better; moderately hard and brittle, or of a consistence betwixt stone and earth: the colour is sometimes whitish or grey;

VOL. III.

Calaminis
Calamus.

sometimes yellowish, or of a deep yellow; sometimes red; sometimes brown or blackish. It is plentiful in several places of Europe, as Hungary, Transylvania, Poland, Spain, Sweden, Bohemia, Saxony, Gosslar, France, and England, particularly in Derbyshire, Gloucestershire, Nottinghamshire, and Somersetshire, as also in Wales. The calamine of England, however, is by the best judges allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds near the surface. In some places it is mixed with lead-ores. It is the only true ore of zinc, and is used as an ingredient in making of brass.*—Newman relates various experiments with this mineral, the only result of which was to show that it contained iron as well as zinc. The most remarkable are the following. A saturated solution of calamine in the marine acid, concentrated by evaporating part of the liquor, exhibits in the cold an appearance of fine crystals, which on the application of warmth dissolve and disappear. A little of this concentrated solution tinges a large quantity of water of a bright yellow colour; and at the same time deposits by degrees a fine, spongy, brownish precipitate. Glue dissolved in this solution, and afterwards inspissated, forms an extremely slippery tenacious mass, which does not become dry, and, were it not too expensive, might be of use for entangling flies, caterpillars, &c. Sulphur boiled in the solution seems to acquire some degree of transparency.—This mineral is an article in the materia medica; but, before it comes to the shops, is usually roasted or calcined, in order to separate some arsenical or sulphureous matter which in its crude state it is supposed to contain, and to render it more easily reducible into a fine powder. In this state it is employed in collyria against defluxions of thin acid humours upon the eyes, for drying up moist running ulcers, and healing excoriations. It is the basis of an official euphotic CERATE.

* See Chemistry, no 377

Though the lapis calaminaris is the only native ore of zinc, there is another substance from which that semi-metal is also obtained. This is called *cadmia fornacum*, or *cadmia of the furnaces*, to distinguish it from the other. This is a matter sublimed when ores containing zinc, like those of Rammelsberg, are melted. This cadmia consists of the flowers of the semi-metal sublimed during the fusion, and adhering to the inner surfaces of the walls of furnaces, where they suffer a semi-fusion, and therefore acquire some solidity. So great a quantity of these are collected, that they form very thick incrustations, which must be frequently taken off. The name of *cadmia of the furnaces* has also been given to all the foots and metallic sublimes formed by smelting in the great, although there is certainly a difference in these matters.

CALAMINT, in botany. See MELISSA, and MENTHA.

CALAMUS (Lat.) signifies a reed or cane*.

* See Arundo

CALAMUS, in the ancient poets, denotes a simple kind of pipe or flutula, the musical instrument of the shepherds and herdsmen; usually made either of an oaten stalk or a reed.

CALAMUS Aromaticus, or Sweet-scented Flag, in the materia medica, a species of flag called *acorus* by Linnaeus. See ACORUS.

CALAMUS Scriptorius, in antiquity, a reed or rush to write with. The ancients made use of styles to write

9 N

on

on tables covered with wax; and of reed, or rush, to write on parchment, or Egyptian paper.

CALAMY (Edmund), an eminent presbyterian divine, born at London in the year 1600, and educated at Pembroke-hall, Cambridge, where his attachment to the Arminian party excluded him from a fellowship. Dr Felton bishop of Ely, however, made him his chaplain; and, in 1639, he was chosen minister of St Mary Aldermary, in the city of London. Upon the opening of the long parliament, he distinguished himself in defence of the Presbyterian cause; and had a principal hand in writing the famous *Smectymnus*, which, himself says, gave the first deadly blow to episcopacy. The authors of this tract were five, the initials of whose names formed the name under which it was published; viz. Stephen Marhal, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Sparlow. He was after that an active member in the assembly of divines, was a strenuous opposer of sectaries, and used his utmost endeavours to prevent those violences committed after the king was brought from the Isle of Wight. In Cromwell's time he lived privately, but was assiduous in promoting the king's return; for which he was afterwards offered a bishopric, but refused it. He was ejected from nonconformity in 1662; and died of grief at the sight of the great fire of London.

CALAMY (Edmund), grandson to the preceding (by his eldest son Mr Edmund Calamy, who was ejected out of the living of Moxton in Essex on St Bartholomew's day 1662), was born in London, April 5th 1671. After having learned the languages, and gone through a course of natural philosophy and logic at a private academy in England, he studied philosophy and civil law at the university of Utrecht, and attended the lectures of the learned Grævius. Whilst he resided here, an offer of a professor's chair in the university of Edinburgh was made him by Mr Cartlairs, principal of that university, sent over on purpose to find a person properly qualified for such an office. This he declined; and returned to England in 1691, bringing with him letters from Grævius to Dr Pocock canon of Christchurch and regius professor of Hebrew, and to Dr Bernard Savilian professor of astronomy, who obtained leave for him to prosecute his studies in the Bodleian library. Having resolved to make divinity his principal study, he entered into an examination of the controversy between the conformists and nonconformists; which determined him to join the latter: and coming to London in 1692, he was unanimously chosen assisant to Mr Matthew Sylvester at Blackfriars; and in 1694, he was ordained at Mr Annesley's meeting-house in Little St-Helena, and soon after was invited to become assisant to Mr Daniel Williams in Hand-Alley. In 1702, he was chosen to be one of the lecturers in Salter's-hall; and, in 1703, succeeded Mr Vincent Altop as pastor of a great congregation in Westminster. He drew up the table of contents to Mr Baxter's history of his life and times, which was sent to the press in 1696; made some remarks on the work itself, and added to it an index; and, reflecting on the usefulness of the book, he saw the expediency of continuing it, for Mr Baxter's history came no lower than the year 1684. Accordingly he composed an abridgement of it, with an account of many other ministers who were ejected after the restoration of Charles II.;

their apology, containing the grounds of their nonconformity and practice as to stated and occasional communion with the church of England; and a continuation of their history till the year 1691. This work was published in 1702. He afterwards published a moderate defence of nonconformity, in three tracts, in answer to some tracts of Dr Hoadley. In 1709, Mr Calamy made a tour to Scotland; and had the degree of doctor of divinity conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713, he published a second edition of his Abridgement of Mr Baxter's history of his life and times; in which, among other additions, there is a continuation of the history through king William's reign, and queen Anne's, down to the passing of the occasional bill; and in the clofe is subjoined the reformed liturgy, which was drawn up and presented to the bishops in 1661, "that the world may judge (he says in the preface) how fairly the ejected ministers have been often represented as irreconcilable enemies to all liturgies." In 1718, he wrote a vindication of his grandfather, and several other persons, against certain reflections cast upon them by Mr Archdeacon Echard in his History of England; and in 1728 appeared his Continuation of the account of the ministers, lecturers, masters, and fellows of colleges, and schoolmasters, who were ejected, after the restoration in 1660, by or before the act of uniformity. He died June 3^d 1732, greatly regretted not only by the dissenters, but also by the moderate members of the established church, both clergy and laity, with many of whom he lived in great intimacy. Besides the pieces already mentioned, he published a great many sermons on several subjects and occasions. He was twice married, and had 13 children.

CALANDRE, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarab or beetle class; it has two antennæ or horns formed of a great number of round joints, and covered with a soft and short down; from the anterior part of the head there is thrust out a trunk, which is so formed at the end, that the creature easily makes way with it through the coat or skin that covers the grain, and gets at the meal or farina on which it feeds; the inside of the grains is also the place where the female deposits her eggs, that the young progeny may be born with provision about them. When the female has pierced a grain of corn for this purpose, she deposits in it one egg, or at the utmost two, but she most frequently lays them single: these eggs hatch into small worms, which are usually found with their bodies rolled up in a spiral form, and after eating till they arrive at their full growth, they are changed into chrysales, and from these in about a fortnight comes out the perfect calandre. The female lays a considerable number of eggs; and the increase of these creatures would be very great: but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites; these little vermin are always very plentiful in granaries, and they destroy the far greater number of these larger animals.

CALAS (John), the name of a most unfortunate Protestant merchant at Toulouse, inhumanly butchered under forms of law cruelly prostituted to shelter the sanguinary dictates of ignorant Popish zeal. He had lived

lived 40 years at Toulouse. His wife was an English woman of French extraction; and they had five sons; one of whom, Lewis, had turned Catholic through the persuasions of a Catholic maid who had lived 30 years in the family. In October 1761, the family consisted of Calas, his wife, Mark Anthony their son, Peter their second son, and this maid. Anthony was educated for the bar; but being of a melancholy turn of mind, was continually dwelling on passages from authors on the subject of suicide, and one night in that month hanged himself on a bar laid across two folding doors in their shop. The crowd collected by the confusion of the family on so shocking a discovery, took it into their heads that he had been strangled by the family to prevent his changing his religion, and that this was a common practice among Protestants. The officers of justice adopted the popular tale, and were supplied by the mob with what they accepted as evidences of the fact. 'The fraternity of white penitents got the body, buried it with great ceremony, and performed a solemn service for him as a martyr; the Franciscans did the same: and after these formalities no one doubted the guilt of the devoted heretical family. They were all condemned to the torture, to bring them to confession: they appealed to the parliament; who, as weak and as wicked as the subordinate magistrates, sentenced the father to the torture ordinary and extraordinary, to be broken alive upon the wheel, and then to be burned to ashes. A diabolical decree! which to the shame of humanity was actually carried into execution. Peter Calas, the other son, was banished for life; and the rest were acquitted. The distracted widow found some friends, and among the rest M. Voltaire, who laid her case before the council of state at Versailles, and the parliament of Toulouse were ordered to transmit the proceedings; which argued something like a disposition toward examining into the treatment of this injured family; but France being a Popish government, the voice of justice was stifled.

CALASH, or CALESH, a small light kind of chariot or chair, with very low wheels, used chiefly for taking the air in parks and gardens. The calash is for the most part richly decorated, and open on all sides for the convenience of the air and prospect, or at most inclosed with light mantlets of wax-cloth to be opened and shut at pleasure. In the Philosophical Transactions we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches, over which it has this further advantage, that whereas a common coach will overturn if one wheel go on a surface a foot and an half higher than the other, this will admit of a difference of $3\frac{1}{2}$ feet without danger of overturning. Add, that it would turn over and over; that is, after the spokes being so turned as that they are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed *in statu quo*, without any disorder to the horse or rider*.

CALASIO (Marius), a Franciscan, and professor of the Hebrew language at Rome, of whom there is very little to be said, but that he published there, in the year 1621, a Concordance of the Bible, which consisted of four great volumes in folio. This work has been highly approved and commended both by

Protestants and Papists, and is indeed a most admirable work. For besides the Hebrew words in the Bible, which are in the body of the book, with the Latin version over against them; there are, in the margin, the differences between the septuagint version and the vulgate; so that at one view may be seen wherein the three Bibles agree, and wherein they differ. Moreover, at the beginning of every article there is a kind of dictionary, which gives the signification of each Hebrew word; affords an opportunity of comparing it with other oriental languages, viz. with the Syriac, Arabic, and Chaldee; and is extremely useful for determining more exactly the true meaning of the Hebrew words.

CALASIRIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment; but this last they were obliged to pull off when they entered the temples, being only allowed to appear there in linen garments.

CALATAJUD, a large and handsome town of Spain, in the kingdom of Arragon; situated at the confluence of the rivers Xalon and Xiloca, at the end of a very fertile valley, with a good castle on a rock. W. Long. 2. 9. N. Lat. 41. 22.

CALATHUS, in antiquity, a kind of hand-basket made of light wood or rushes; used by the women sometimes to gather flowers, but chiefly, after the example of Minerva, to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. The calathus or work-basket of Minerva is no less celebrated among the poets than her distaff.

CALATHUS was also the name of a cup for wine, used in sacrifices.

CALATRAVA, a city of new Castile, in Spain, situated on the river Guadiana, 45 miles south of Toledo. W. Long. 4. 20. N. Lat. 39. 0.

Knights of CALATRAVA, a military order in Spain, instituted under Sancho III. king of Castile, upon the following occasion. When that prince took the strong fort of Calatrava from the moors of Andalusia, he gave it to the templars, who, wanting courage to defend it, returned it him again. Then Don Raymond, of the order of the Cistercians, accompanied with several persons of quality made an offer to defend the place, which the king thereupon delivered up to them, and instituted that order. It increased so much under the reign of Alphonsus, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of pope Innocent VIII. reunited the grand-mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a cross gules, flowered with green, &c. Their rule and habit was originally that of the Cistercians.

CALAURIA, (anc. geog.), an island of Greece in the Saronic bay, overagainst the port of Troezen, at the distance of 40 stadia. It was 30 stadia in compass, and had a temple of Neptune held in great veneration. It was also an asylum, and the place of the convention or assembly of the seven cities of the Amphictyons. To this place Demosthenes went twice into banishment.

CALCADA, or *St Domingo CALCALDA*, a town of Spain, 9 N 2

*See Meuschen, no 76.

Calcar
Calculation.

Spain, situated in W. Long. 3. 5. N. Lat. 42. 36.
CALCAR, a very strong town of Germany, in the circle of Westphalia, and duchy of Cleves. It belongs to the king of Prussia, and is seated near the Rhine, in E. Long. 5. 41. N. Lat. 51. 45.

CALCAR, in glass-making, the name of a small oven, or reverberatory furnace, in which the first calcination of sand and salt of potashes is made for the turning them into what is called *frit*. This furnace is made in the fashion of an oven, ten feet long, seven broad in the widest part, and two feet deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it at the mouth by bricks nine inches wide. Into this trench they put sea-coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the *frit*, over the surface of which the smoke flies very black, and goes out at the mouth of the calcar; the coals burn on iron grates, and the ashes fall through.

CALCAR (John de), a celebrated painter, was the disciple of Titian, and perfected himself by studying Raphael. Among other pieces he drew a nativity, representing the angels around the infant Christ; and so ordered the disposition of his picture, that the light all proceeds from the child. He died at Naples, in 1546, in the flower of his age. It was he who designed the anatomical figures of Vesal, and the portraits of the painters of Vclari.

CALCAREOUS EARTHS. See EARTH.

CALCEARIUM, in antiquity, a donative or largess bestowed on Roman soldiers for buying shoes. In monasteries, *calcearium* denoted the daily service of cleaning the shoes of the religious.

CALCHAS, in fabulous history, a famous diviner, followed the Greek army to Troy. He foretold that the siege would last ten years; and that the fleet, which was detained in the port of Aulis by contrary winds, would not fail till Agamemnon's daughter had been sacrificed to Diana. After the taking of Troy, he retired to Colophon; where, it is said, he died of grief, because he could not divine what another of his profession, called *Mopsus*, had discovered.

CALCINATION, in chemistry, the reducing of substances to a calx by fire.*

CALCINATO, a town of Italy, in the duchy of Mantua, remarkable for a victory gained over the Imperialists by the French in 1706. E. Long. 9. 55. N. Lat. 45. 25.

CALCULARY of a PEAR, a congeries of little strong knots dispersed through the whole parenchyma of the fruit. The calculary is most observed in rough-tailed or choak-pears. The knots lie more continuous and compact together towards the pear where they surround the ACETARY. About the stalk they stand more distant; but towards the cork, or stool of the flower, they still grow closer, and there at last gather into the firmness of a plumb-stone. The calculary is no vital or essential part of the fruit; the several knots whereof it consists being only for many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

CALCULATION, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See ARITHMETIC.

CALCULATION is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the time of eclipses, &c.*

CALCULUS, primarily denotes a little stone or pebble, anciently used in making computations, taking of sufrages, playing at tables, and the like. In after-times, pieces of ivory, and counters struck of silver, gold, and other matters, were used in lieu thereof, but still retaining the ancient names. Computists were by the lawyers called *calculones*, when they were either slaves or newly freed men; those of a better condition were named *calculatores*; or *numerarii*: ordinarily there was one of these in each family of distinction. The Roman judges anciently gave their opinions by calculi, which were white for absolution, and black for condemnation. Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in a person to be absolved and acquitted of a charge, or elected to some dignity or post; as *calculus niger* did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by *white*, and their unhappy by *black*, pebbles, put each night into an urn.

Besides the diversity of colour, there were some calculi also which had figures or characters engraven on them, as those which were in use in taking the sufrages both in the senate and at assemblies of the people. These calculi were made of thin wood, polished, and covered over with wax. Their form is still seen in some medals of the Cassian family; and the manner of casting them into the urns, in the medals of the Licinian family. The letters marked upon these calculi were U. R. for *uti rogar*, and A. for *antiquo*; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges who sat in capital causes used calculi marked with the letter A for *absolvo*; C for *condemno*; and N. L. for *non liquet*, signifying that a more full information was required.

CALCULUS *Humanus*, the stone in the bladder or kidneys. These are commonly formed of different strata or incrustations; sometimes smooth and heavy like mineral stones; but oftener rough, spongy, light, and full of inequalities or protuberances: chemically analysed, or distilled in an open fire, they nearly yield the same principles as urine itself, or at least an empyreumatic volatile urinous matter, together with a great deal of air*. They never have, nor can have, naturally, any foreign matter for a basis: but they may by accident; an instance of which is related by Dr Percival †. A bougie had unfortunately slipped into the bladder, and upon it a stone of a considerable size was formed in less than a year. This stone had so much the appearance of chalk, that the Doctor was induced to try whether it could be converted into quicklime. His experiment succeeded, both with that and some other calculi; from which he conjectures, that hard waters which contain calcareous earth may contribute towards the formation of these calculi. See (the Index subjoined to) MEDICINE.

CALCULUS *Specialis*, or *Literalis*, is the same with ALGEBRA.

CALCUTTA, an English settlement in Asia, on one of the branches of the river Ganges in the kingdom of Bengal. The air here is unhealthy, the water brackish,

ist, the anchorage not very safe, and the neighbouring country affords but few manufactures. Notwithstanding these inconveniences, great numbers of rich Armenian, Moorish, and Indian merchants, invited by the prospect of liberty and security, have fixed their residence here. The people have multiplied in proportion thro' the territory, which is three or four leagues in circumference, and of which the East India company are the only sovereigns. The fortress called *William's Fort*, has this advantage, that the vessels bound to the European settlements are obliged to pass under its cannon*. The town of Calcutta is remarkable for the fate of those unhappy gentlemen who in 1757 were suffocated in the dungeon called the *Black hole*†.

* See *William's Fort*.

† See *Ben-gal*, vol. 10.

CALDARIUM, in the ancient baths, a certain vault or room made so as to collect the vapours, and produce sweating; whence it signifies a *hot-house*, *bagin*, *stove*, or *sweating-room*.

CALDERINUS (Domitius), a learned critic, born at Calderia near Verona. He read lectures upon polite literature at Rome with great reputation; and was the first who ventured to write upon the most difficult of the ancient poets. He died very young in 1477.

CALDERON, De la Barca, (Dom. Pedro), a Spanish officer, who after having signalized himself in the military profession, quitted it for the ecclesiastical, and then commenced dramatic writer. His dramatic works make 9 vols in 4to, and some Spanish authors have compared him to Shakespeare. He flourished about the year 1640.

CALDERWOOD (David), a famous divine of the church of Scotland, and a distinguished writer in behalf of the Presbyterians, was descended of a good family in that kingdom; and being early designed for the ministry, he applied with great diligence to the study of the Scriptures in their original tongues, the works of the fathers, the councils, and the best writers on church-history. He was settled about the year 1604 at Creling near Jedburgh. King James I. of Great Britain, being desirous of bringing the church of Scotland nearer to a conformity with that of England, laboured earnestly to restore the episcopal authority, and enlarge the powers of the bishops who were then in Scotland. This design was very warmly opposed by many of the ministers, and particularly by Mr David Calderwood; who, when Mr James Law, bishop of Orkney, came to visit the presbyteries of Merse and Teviotdale, declined his jurisdiction by a paper under his hand dated May 5th 1608. But the king having its success much at heart, sent the earl of Dunbar, then high-treasurer of Scotland, with Dr Abbot afterwards archbishop of Canterbury, and two other divines, into that kingdom, with instructions to employ every method to persuade both the clergy and laity of his majesty's sincere desire to promote the good of the church, and of his zeal for the Protestant religion. Mr Calderwood did not assist at the general assembly held at Glasgow June 8th 1610, in which lord Dunbar presided as commissioner; and it appears from his writings, that he looked upon every thing transacted in it as null and void. In May following, king James went to Scotland; and on the 17th of June, held a parliament at Edinburgh: at that time the clergy met in one of the churches, to hear and advise with the bishops; which kind of assembly, it seems, was contri-

ved in order to resemble the English convocation. Mr Calderwood was present at it, but declared publicly that he did not take any such meetings to resemble a convocation; and being opposed by Dr Whitford, and Dr Hamilton, who were friends to the bishops, he took his leave of them in these words: "It is absurd to see men sitting in silks and fattins, and to cry poverty in the kirk, when purity is departing." The parliament proceeded in the mean while in the dispatch of business; and Mr Calderwood, with several other ministers, being informed that a bill was depending to empower the king, with the advice of the archbishops, bishops, and such a number of the ministry as his majesty should think proper, to consider and conclude as to matters decent for the external policy of the church, not repugnant to the word of God; and that such conclusions should have the strength and power of ecclesiastical laws: against this they protested, for four reasons.

1. Because their church was so perfect, that, instead of needing reformation, it might be a pattern to others.
2. General assemblies, as now established by law, and which ought always to continue, might by this means be overthrown.
3. Because it might be a means of creating schism, and disturb the tranquillity of the church.
4. Because they had received assurances, that no attempts should be made to bring them to a conformity with the church of England. They desired therefore, that, for these and other reasons, all thoughts of passing such a law might be laid aside: but in case this be not done, they protest for themselves and their brethren who shall adhere to them, that they can yield no obedience to this law when it shall be enacted, because it is destructive of the liberty of the church; and therefore shall submit to such penalties, and think themselves obliged to undergo such punishments, as may be inflicted on them for disobeying that law. This protest was signed by Mr Archibald Simson on behalf of the members, who subscribed another separate roll, which he kept, for his justification. This protest was presented to the clerk register, who refused to read it before the states in parliament. However, though not read, it had its effect; for although the bill had the consent of parliament, yet the king thought fit to cause it to be laid aside, and not long after called a general assembly at St Andrews. Soon after the parliament was dissolved, and Mr Calderwood was summoned to appear before the high-commission court at St Andrews, on the 8th of July following, to answer for his mutinous and seditious behaviour. July 10th, the king came to that city in person; when Mr Calderwood, being called upon, and refusing to comply with what the king in person required of him, was committed to prison. Afterwards the privy council, according to the power exercised by them at that time, directed him to banish himself out of the king's dominions before Michaelmas next; and not to return without licence. Having applied to the king for a prerogative of his sentence without success, because he would neither acknowledge his offence, nor promise conformity for the future, he retired to Holland, where, in 1623, he published his celebrated piece entitled *Altare Damascenum*. Mr Calderwood having in the year 1624 been afflicted with a long fit of sickness, and nothing having been heard of him, for some time, one Mr Patrick Scot, as Calderwood himself informs us, took it for granted that

he

Caldron
Caledonia.

Caledonia.

he was dead; and thereupon wrote a recantation in his name, as if, before his decease, he had changed his sentiments. This imposture being detected, Scot went over to Holland, and staid three weeks at Amsterdam, where he made a diligent search for the author of Altare Damascenum, with a design to have dispatched him. But Calderwood had privately retired into his own country, where he lived several years. Scot gave out that the king had furnished him with the matter for the pretended recantation, and that he only put it in order. During his retirement, Mr Calderwood collected all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there down to the death of king James; which collection is still preserved in the university library of Glasgow; that which was published under the title of "The true history of Scotland," is only an extract from it. In the advertisement prefixed to the last edition of his Altare Damascenum mention is made of his being minister of Pencaitland near Edinburgh in 1638; but we find nothing said there, or any where else, of his death.

CALDRON, a large kitchen utensil, commonly made of copper; having a moveable iron handle, whereby to hang it on a chimney-hook.

Boiling in CALDRONS, is a capital punishment spoken of in middle-age writers, decreed to divers sorts of criminals, but chiefly to debasers of the coin.

CALDWALL (Richard), a learned English physician, born in Staffordshire about the year 1513. He studied physic in Brazen-Nose college, Oxford; and was examined, admitted unto, and made censor of, the college of physicians at London, all in one day. Six weeks after he was chosen one of the elects; and in the year 1570, was made president of that college. Mr Wood tells us, that he wrote several pieces in his profession; but he does not tell us what they were, only that he translated a book on the art of surgery, written by one Horatio More, a Florentine physician. We learn from Camden, that Caldwell founded a chirurgical lecture in the college of physicians, and endowed it with a handsome salary. He died in 1585.

CALEB, one of the deputies sent by the Israelites to take a view of the land of Canaan. He made a good report of the country, and by this means revived the spirits of the dejected people; on which account, he and Joshua were the only persons who, after their leaving Egypt, settled in the land of Canaan. Caleb had, for his share, the mountains and the city of Hebron, from which he drove three kings. Othniel his nephew having taken the city of Debir, Caleb gave him his daughter Achsah in marriage; and died, aged 114.

CALEDONIA, the ancient name of Scotland*.

CALEDONIA, the name of a settlement made by the Scots, on the west side of the gulph of Darien, in 1698; out of which they were starved at the request of the East-India company: for the English government prohibited the other colonies sending them any provisions; so they were obliged to leave it in 1700.

New CALEDONIA, an island in the south-sea, lately discovered by captain Cook, and, next to New Holland and New Zealand, is the largest island that hath yet been discovered in that sea. It extends from 19. 37. to 22. 30. S. Lat. and from 163. 37. to 167. 14.

E. Long. Its length from north-west to south-east is about 80 leagues; but its greatest breadth does not exceed ten leagues. This island is diversified by hills and valleys of various size and extent. From the hills issue abundance of rivulets, which contribute to fertilize the plains. Along its north-east shore the land is flat; and being well watered, and cultivated by the inhabitants after their manner, appeared to great advantage to captain Cook's people. Was it not, indeed, for those fertile spots on the plains, the whole country might be called a *dreary waste*: the mountains and higher parts of the land are in general incapable of cultivation. They consist chiefly of rocks, many of which are full of mundic; the little soil that is upon them is scorched and burnt up by the sun; it is, however, covered with coarse grass and other plants, and here and there covered with trees and shrubs. The country in general bears a great resemblance to those parts of New South Wales which lie under the same parallel of latitude. Several of its natural productions are the same, and the woods are without underwood as well as in that country. The whole coast seems to be surrounded by reefs and shoals, which render all access to it extremely dangerous; but at the same time guard the coasts against the attacks of the wind and sea; rendering it easily navigable along the coast by canoes, and causing it abound with fish. Every part of the coast seems to be inhabited; the plantations in the plains are laid out with great judgment, and cultivated with much labour. They begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preserving its vigour by manure; they, however, recruit it by letting it lie for some years untouched. On the beach was found a large irregular mass of rock, not less than a cube of ten feet, consisting of a close-grained stone speckled full of granates somewhat bigger than pins heads, from whence it seems probable that some valuable minerals may be found on this island. It differs from all the other islands yet discovered in the South Sea, by being entirely destitute of volcanic productions. Several plants of a new species were found here; and a few young breadfruit trees, not then sufficiently grown to bear fruit, seemed to have come up without culture: plantains and sugar-canes are here in small quantity, and the cocoa-nut trees are small and thinly planted. A new species of passion-flower was likewise met with, which was never known to grow wild any where but in America. Several *Caputi* (MELALEUCA) trees were also found in flower. Musketoes here are very numerous. A great variety of birds were seen of different classes, which were for the most part entirely new; particularly a beautiful species of parrot before unknown to zoologists. A new species of fish, of the genus called by Linnaeus *tetraodon*, was caught here; and its liver, which was very large, presented at supper. Several species of this genus being reckoned poisonous, and the present species being remarkably ugly, Mess. Forsters hinted their suspicions of its quality; but the temptation of a fresh meal, and the assurances of captain Cook that he had formerly eaten this identical sort of fish without harm, got the better of their scruples, and they eat of it. Its oiliness, however, though it had no other bad taste than what proceeded from this, prevented them from taking more than a morsel or two. In a few hours after they had

* See Scotland.

had retired to rest, they were awakened by very alarming symptoms, being all seized with an extreme giddiness; their hands and feet were numbed, so that they were scarcely able to crawl; and a violent languor and oppression seized them. Emetics were administered with some success, but sudorifics gave the greatest relief. Some dogs who had eaten the remainder of the liver were likewise taken ill; and a pig which had eaten the entrails died soon after, having swelled to an unusual size. The effects of this poison on the gentlemen did not go entirely off in less than six weeks.—Abundance of turtle was seen here. The natives had not the least notion of goats, hogs, dogs, or cats, and had not even a name for any of them.

The inhabitants are very stout, tall, and in general well proportioned; their features mild; their beards and hair black, and strongly frizzled, so as to be somewhat woolly in some individuals: their colour is swarthy, or a dark chestnut brown. A few were seen who measured six feet four inches. They are remarkably courteous, not at all addicted to pilfering and stealing; in which character of honesty they are singular, all the other nations in the South Sea being remarkably thievish. Some wear their hair long, and tie it up to the crown of their heads; others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropped short. They make use of a kind of comb made of sticks of hard wood from seven to nine or ten inches long, and about the thickness of knitting needles; a number of these, seldom exceeding 20, but generally fewer, are fastened together at one end, parallel to and near one tenth of an inch from each other; the ends, which are a little pointed, will spread out or open like the flicks of a fan. These combs they always wear in their hair on one side of their head. Some had a kind of concave cylindrical stiff black cap, which appeared to be a great ornament among them, and was supposed to be worn only by the chiefs and warriors. A large sheet of strong paper, whenever they got one in exchange, was commonly applied to this purpose. The men go naked; only tying a string round their middle, and another round their neck. A little piece of a brown cloth made of the bark of a fig-tree, sometimes tucked up to the belt, and sometimes pendulous, scarcely deserves the name of a covering; nor indeed does it seem at all intended for that purpose. This piece of cloth is sometimes of such a length, that the extremity is fastened to the string round the neck; to this string they likewise hang small round beads of a pale green nephritic stone. Coarse garments were seen among them made of a sort of matting; but they seemed never to wear them, except when in their canoes and unemployed. The women seemed to be in a servile state: they were the only persons of the family who had any employment, and several of them brought bundles of sticks and fuel on their backs: those who had children carried them on their backs in a kind of fatchel. The women also were seen to dig up the earth in order to plant it. They are in general of a dark chestnut, and sometimes mahogany brown; their stature middle-sized, some being rather tall, and their whole form rather stout, and somewhat clumsy. Their dress is the most disfiguring that can be imagined, and gives them a thick squat shape; it is a short petticoat

or fringe, consisting of filaments or little cords, about eight inches long, which are fastened to a very long string, which they have tied several times round their waist. The filaments, or little ropes, therefore, lie above each other in several layers, forming a kind of thick thatch all round the body, but which does not near cover the thigh: these filaments were sometimes dyed black; but frequently those on the outside only were of that colour, the rest being of a dirty grey. There was not a single infant, during the ship's stay in this island, of the women permitting any indecent familiarity with an European: they took pleasure in practising the arts of a jilting coquette, but never became absolute wantons. The general ornaments of both sexes are ear-rings of tortoise shells; necklaces, or amulets, made both of shells and stones; and bracelets made of large shells, which they wear above the elbows.

The houses, or huts, in New Caledonia, are circular, something like a bee-hive, and full as close and warm; the entrance is by a small door, or long square hole, just big enough to admit a man bent double: the side walls are about four feet and a half high; but the roof is lofty, and peaked to a point at the top, above which is a post or stick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c. and both sides and roof are thick, and close covered with thatch made of coarse long grass. In the inside of the house are set up posts, to which cross spars are fastened, and platforms made, for the convenience of laying any thing on. Some houses have two floors, one above another; the floor is laid with dried grass, and here and there mats are spread for the principal people to sit or sleep on. In these houses there was no passage for the smoke but through the door; they were intolerably smoky, and so hot as to be insupportable to those unaccustomed to them: probably the smoke is intended to drive out the musketoes which swarm here. They commonly erect two or three of these huts near each other under a cluster of lofty fig-trees, whose leaves are impervious to the rays of the sun.

The canoes used here are very heavy clumsy vessels; they are made of two trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk head of the same height; so that the whole is like a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fastened to each other about three feet asunder, by means of cross spars, which project about a foot over each side. Over these is laid a deck or heavy platform made of plank and small round spars, on which they have a fire-hearth, and generally a fire burning; they are navigated by one or two latten sails, extended to a small latten yard, the end of which is fixed in a notch or hole in the deck.

Notwithstanding the inoffensive disposition of the inhabitants of New Caledonia, they are well provided with offensive weapons; as clubs, spears, darts, and slings for throwing stones. Their clubs are about two feet and an half long, and variously formed; some like a scythe, others like a pick-axe; some have a head like a hawk, and others have round heads, but all are neatly made; many of their darts and spears are no less neat, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the

Calendar
||
Calendar.

the stones that they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They drive the dart by the assistance of short cords knobbed at one end and looped at the other, called by the seamen *beckets*. These contained a quantity of red wool taken from the vampyre, or great Indian bat. Bows and arrows are wholly unknown among them.

Their language bears no affinity to that spoken in the other South-sea islands, the word *arreeke* and one or two more excepted. This is the more extraordinary, as different dialects of one language were spoken not only in the easterly islands, but at New Zealand.

A musical instrument, a kind of whistle, was procured here. It was a little polished piece of brown wood about two inches long, shaped like a kind of bell, tho' apparently solid, with a rope fixed at the small end; two holes were made in it near the base, and another near the insertion of the rope, all which communicated with each other; and by blowing in the uppermost, a shrill sound like whistling was produced: no other instrument was seen among them that had the least relation to music.

Many of the New-Caledonians were seen with prodigiously thick legs and arms, which seemed to be affected with a kind of leprosy; the swelling was found to be extremely hard, but the skin was not alike harsh and scaly in all those who were afflicted with the disorder. The preternatural expansion of the arm or leg did not appear to be a great inconvenience to those who suffered it; and they seemed to intimate that they very rarely felt any pain in it; but in some the disorder began to form blotches, which are marks of a great degree of virulence.

Here they bury their dead in the ground. The grave of a chief who had been slain in battle here resembled a large mole-hill, and was decorated with spears, darts, paddles, &c. all stuck upright in the ground round about it. Lieutenant Pickersgill was shewed a chief whom they named *Tea-booma*, and styled their *arreeke* or king; but nothing further is known of their government, and nothing at all of their religion.

CALEFACTION, the production of heat in a body from the action of fire, or that impulse impressed by a hot body on others around it. This word is used in pharmacy, by way of distinction from *cottion*, which implies boiling; whereas calefaction is only heating a thing.

CALEMBERG, a castle of Germany, in the duchy of Brunswick and principality of Calenberg. It is seated on the river Leine, and is 15 miles south of Hanover. It is subject to the duke of Brunswick Lunenburg, elector of Hanover, and king of Great Britain. E. Long. 9. 43. N. Lat. 52. 20.

CALEMBERG, a principality of Lower Saxony, and one of the three parts of the duchy of Brunswick, is bounded on the north by the duchy of Verden, on the east by the principality of Zell, on the south by the principalities of Grubenhagen and Wolfenbüttele, and on the west by Westphalia. It belongs to the elector of Hanover.

CALENDAR, in astronomy and chronology. See **KALENDAR**.

CALENDAR of prisoners, in law, a list of all the prisoners names in the custody of each respective sheriff.

CALENDARIUM FLORÆ, in botany, a calendar containing an exact register of the respective times in which the plants of any given province or climate germinate, expand, and shed their leaves and flowers, or ripen and disperse their seeds. For particulars on this curious subject, see the articles **DEFOLIATIO**, **EFFLORESCENTIA**, **FRONDESCENTIA**, **FRUCTESCENTIA**, and **GERMINATIO**.

CALENDER, a machine used in manufactories to press certain woollen and silken stuffs and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in mohairs and tabbies. This instrument is composed of two thick cylinders or rollers, of very hard and well polished wood, round which the stuffs to be calendered are wound: these rollers are placed cross-wise between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw with a rope fastened to a spindle which makes its axis: the uppermost board is loaded with large stones weighing 20,000 lb or more. At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert. The lower table or plank is made of a block of smooth marble, and the upper is lined with a plate of polished copper.—The alternate motion of the upper board sometimes one way and sometimes another, together with the prodigious weight laid upon it, gives the stuffs their gloss and smoothness; or gives them the waves, by making the cylinders on which they are put roll with great force over the undermost board. When they would put a roller from under the calender, they only incline the undermost board of the machine. The dressing alone, with the many turns they make the stuffs and linens undergo in the calender, gives the waves, or waters them, as the workmen call it. It is a mistake to think, as some have asserted, and Mr Chambers among others, that they use rollers with a shallow indenture or engraving cut into them.

CALENDERS, a sort of Mahometan friars, so called from Santon Calenderi their founder. This Santon went bareheaded, without a shirt, and with the skin of a wild beast thrown over his shoulders. He wore a kind of apron before, the strings of which were adorned with counterfeit precious stones. His disciples are rather a sect of Epicureans, than a society of religious. They honour a tavern as much as they do a mosque; and think they pay as acceptable worship to God by the free use of his creatures, as others do by the greatest austerities and acts of devotion. They are called, in Persia and Arabia, *Abdals*, or *Abdallat*, i. e. persons consecrated to the honour and service of God. Their garment is a single coat, made up of a variety of pieces, and quilted like a rug. They preach in the market-places, and live upon what their auditors bestow on them. They are generally very vicious persons; for which reason they are not admitted into any houses.

CALENDS, in Roman antiquity. See **KALENDS**.
CALENDULA, the *MARYGOLD*; a genus of the polygamia necessaria order, belonging to the syngenesia class of plants. Of this there are eight species, none of them natives of Europe. The common kind is so well known as to need no definition; and none of the others

Calendar
||
Calendar.

* See the article *Execution*.

others merit any, except the fruticosa, which hath lately been introduced from the Cape of Good Hope. It hath a slender, shrubby, perennial stalk, which rises to the height of seven or eight feet, but requires support: this sends out a great number of weak branches from the bottom to the top, which hang downward unless they are supported: they are garnished with oval leaves, having short flat footstalks; these are of a shining green colour on their upper side, but paler underneath: the flowers come out at the end of the branches, on short naked footstalks. This is easily propagated by cuttings, which may be planted at any time in summer in a shady border, or otherwise shaded with mats in the heat of the day: in five or six weeks these will have taken root, when they should be separately taken up, each put in a separate pot, and placed in the shade till they have taken fresh root; then they may be placed, with other hardy exotic plants, in a sheltered situation, where they may remain till the frost begins, when they must be removed into the green-house, placing them near the windows that they may enjoy the free air; for this plant only requires protection from frost. The seeds of the common fort may be sown in March or April, where the plants are to remain; and will require no other culture but to keep them clear of weeds, and to thin the plants where they are too thick. The flowers of the common marigold are supposed to be aperient and attenuating, as also cardiac, alexipharmac, and sudorific; they are principally celebrated in uterine obstructions, the jaundice, and for throwing out the small-pox. Their sensible qualities, however, give little foundation for these virtues: they have scarce any taste, and have no considerable smell. The leaves of the plant discover a viscid sweetness, accompanied with a more durable saponaceous pungency and warmth: these seem capable of answering some useful purposes as a stimulating, aperient, and antiscorbutic medicine.

CALENTIUS (Eliſius), a Neapolitan poet and prose author. He was preceptor to Frederic the son of Ferdinand king of Naples, and the earliest writer on the illegality of putting criminals to death except for murder. Died in 1503.

CALENTURE, a feverish disorder incident to sailors in hot countries; the principal symptom of which is their imagining the sea to be green fields: hence, attempting to walk abroad in these imaginary places of delight, they are frequently lost. Vomiting, bleeding, a spare diet, and the neutral salts, are recommended in this disorder; a single vomit commonly removing the delirium, and the cooling medicines completing the cure.

CALEPIN (Ambrosius), an Augustin monk of Caplepio, whence he took his name, in the 16th century. He is author of a dictionary of eight languages, since augmented by Passerat and others.

CALES (anc. geog.), a municipal city of some note in Campania, at no great distance from Capilinum. The epithet *Calenur* is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES, (anc. geog.), a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called *le Pais de Gaux*, in Normandy.

CALETURE, a fort on the island of Ceylon, at Vol. III.

the mouth of a river of the same name. The Dutch became masters of it in 1655; but were afterwards obliged to leave it. E. Long. 80. 51. N. Lat. 6. 38.

CALF, in zoology, the young of the ox kind.

There are two ways of breeding calves that are intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have suckled about a fortnight; they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May: they should have milk for 12 weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the calf has been fed on milk for about a month, little whisps of hay should be placed all about him in cleft sticks to induce him to eat. In the beginning of April they should be turned out to graze; only for a few days they should be taken in for the night, and have milk and water given them: the same may also be given them in a pail sometimes in the field, till they are so able to feed themselves that they do not regard it. The grafs they are turned into must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at grafs; for if it be done with hay and water, they often grow big-belly'd on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the rest should be gelt for oxen: the sooner the better. Between 10 and 20 days is a proper age. About London almost all the calves are fatted for the butcher. The reason of this is, that there is a good market for them; and the lands there are not so profitable to breed upon as in cheaper countries. The way to make calves fat and fine is, the keeping them very clean; giving them fresh litter every day; and the hanging a large chalk-stone in some corner where they can easily get at it to lick it, but where it is out of the way of being soiled by their dung and urine. The coops are to be placed so as not to have too much fun upon them, and so high above the ground that the urine may run off. They also bleed them once when they are a month old, and a second time before they kill them; which is a great addition to the beauty and whiteness of their flesh: the bleeding is by some repeated much oftener, but this is sufficient. Calves are very apt to be loose in their bowels; which waistes and very much injures them. The remedy is to give them chalk scraped among milk, pouring it down with a horn. If this does not succeed, they give them bole armenic in large doses, and use the cold bath every morning. If a cow will not let a strange calf suck her, the common method is to rub both her nose and the calf's with a little brandy; this generally reconciles them after a few smellings.

Golden CALF, an idol set up and worshipped by the Israelites at the foot of Mount Sinai in their passage through the wilderness to the land of Canaan. Our version makes Aaron fashion this calf with a graving tool after he had cast it in a mould: the Geneva translation makes him engrave it first, and cast it afterwards. Others, with more probability, render the whole verse

Calf
||
Caliconlan.

thus: "And Aaron received them, (the golden earrings), and tied them up in a bag, and got them cast into a molten calf;" which version is authorised by the different senses of the word *tsur*, which signifies to tie up or bind, as well as to shape or form; and of the word *cherret*, which is used both for a graving tool and a bag. Some of the ancient fathers have been of opinion that this idol had only the face of a calf, and the shape of a man from the neck downwards, in imitation of the Egyptian Isis. Others have thought it was only the head of an ox without a body. But the most general opinion is, that it was an entire calf in imitation of the Apis worshipped by the Egyptians; among whom, no doubt, the Israelites had acquired their propensity to idolatry. This calf Moses is said to have burnt with fire, reduced to powder, and strewn upon the water which the people were to drink. How this could be accomplished hath been a question. Most people have thought, that as gold is indelible, it could only be burnt by the miraculous power of God; but M. Stahl conjectures that Moses dissolved it by means of liver of sulphur †. The Rabbins tell us that the people were made to drink of this water in order to distinguish the idolaters from the rest; for that as soon as they had drunk of it, the beards of the former turned red. The cabbalists add, that the calf weighed 125 quintals; which they gather from the Hebrew word *massékah*, whose numerical letters make 125.

See CALF. See PHOCA.

CALI, a town of Popayan in South America, seated in a valley of the same name on the river Cauca. The governor of the province usually resides there. W. Long. 78. 5. N. Lat. 3. 15.

CALIBER, or CALIPER, properly denotes the diameter of any body; thus we say, two columns of the same caliber, the caliber of the bore of a gun, the caliber of a bullet, &c.

CALIBER-Compasser, a sort of compasses made with arched legs to take the diameter of round or swelling bodies. See COMPASSES.

Caliber-compasses, are chiefly used by gunners, for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular; and move on an arch of brass, whereon is marked the inches and half inches, to show how far the points of the compasses are opened asunder.

Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use calipers, to embrace the two heads of any cask, in order to find its length.

The calipers used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

CALIBER-Rule, is an instrument, wherein a right line is so divided, as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first, as the diameters of balls of two, three, four, &c. pounds, are to the diameter of a ball of one pound. The caliper is used by engineers, from the weight of the ball given, to determine its diameter or caliper, or vice versa.

CALICOULAN, or QUILLON, a town of Asia, in the East Indies, on the coast of Malabar, and in the peninsula on this side the Ganges, where the Dutch have a factory. E. Long. 75. 21. N. Lat. 9. 5.

Calicut
||
California.

CALICUT, a kingdom of India, on this side the Ganges, upon the coast of Malabar. It is about 63 miles long, and as much broad. It has many woods, rivers, and marshes, and is very populous; but does not produce much corn, abundance of rice being imported from Canara. The land along the sea-coast is low and sandy, and produces a number of cocoa-trees. The higher grounds produce pepper and cardamoms of a very good quality. They have likewise timber for building, white and yellow sanders, cassia lignea, cassia fistula, nux vomica, and cocculus indicus. The woods abound with parrots and monkeys, as well as different kinds of game. They have also plenty of fish, several sorts of medicinal drugs, and their mountains produce iron. The *samorin*, or king, of Calicut, was once master of all the coast of Malabar; but at his death he left it by will among four of his nephews. He who governs Calicut has a palace of stone, and there is some appearance of grandeur about his court. He carries on a considerable trade, which makes the people of Calicut richer than their neighbours. In former times they had several strange customs, some of which are still kept up; particularly the samoria's wife must be first enjoyed by the high priest, who may have her three nights if he pleases. The nobles permit the other priests to take the same liberty, but the lower people cannot have that honour. A woman may marry a number of husbands; each of whom has her ten days or more by turns, as they agree among themselves; and provides her all things necessary during that time. When she proves with child, she names the father; who, after the child is weaned, takes care of its education. These people have no pens, ink, or paper; but write with a bodkin on flags that grow by the sides of the rivers. By this means the letters are in some sense engraved; and so tough are the flags, that they will last for a great number of years. This was the first land discovered by the Portuguese in 1498.

CALICUT, a town of Asia, in the kingdom of that name on the coast of Malabar. It contains a great number of mean low houses, each of which has a garden. The English had a factory here, but it is removed to Tilicherry. E. Long. 76. 4. N. Lat. 11. 21.

CALIDÆ PLANTÆ; (from *calor* heat); plants that are natives of warm climates. Such are those of the East Indies, South America, Egypt, and the Canary Islands. These plants, says Linnæus, will bear a degree of heat which is as 40 on a scale in which the freezing point is 0, and 100 the heat of boiling water. In the 10th degree of cold they cease to grow, lose their leaves, become barren, are suffocated, and perish.

CALIDUCT, in antiquity, a kind of pipes or canal disposed along the walls of houses or apartments, used by the ancients for conveying heat to several remote parts of the house from one common furnace.

CALIFORNIA, the most northerly of all the Spanish dominions on the continent of America, is sometimes distinguished by the names of *New Albion*, and the *Isles Carabiras*; but the most ancient appellation is *California*; a word probably owing to some accident, or to some words spoken by the Indians and misunderstood by the Spaniards. For a long time California was thought to be an island; but Father Caining, a German Jesuit, discovered it to be a peninsula joining to the coast of New Mexico and the southern parts of America.

rica.

† See Chemi-
stry, n^o 311
—325.

rica. This peninsula extends from Cape St Sebastian, lying in north latitude 43. 30. to Cape St Lucar which lies in north latitude 22. 32. It is divided from New Mexico by the gulph, or as some call it the *laks*, of California, or *Vermilion Sea*, on the east; on the north, by that part of the continent of North America which is least known; and on the west and south, by the Pacific Ocean or great South Sea. The coasts, especially towards the Vermilion Sea, are covered with inhabited islands, on some of which the Jesuits have established settlements, such as St Clement, Paxaros, St Anne, Cedars (so called from the great number of these trees it produces), St Joseph, and a multitude of others. But the islands best known are three lying off Cape St Lucar, towards the Mexican coast. These are called *Les Tres Marias*, "the three Marias." They are but small, have good wood and water, salt pits, and abundance of game; therefore the English and French pirates have sometimes wintered there, when bound on cruizes in the South Seas.

As California lies altogether within the temperate zone, the natives are neither chilled with cold, nor scorched with heat; and indeed the improvements in agriculture made by the Jesuits afford strong proofs of the excellency of the climate. In some places the air is extremely hot and dry; and the earth wild, rugged, and barren. In a country stretching about 800 miles in length, there must be considerable variations of soil and climate; and indeed we find, from good authority, that California produces some of the most beautiful lawns, as well as many of the most inhospitable deserts, in the universe. Upon the whole, although California is rather rough and craggy, we are assured by the Jesuit Vinegas, and other good writers, that with due culture it furnishes every necessary and convenience of life; and that, even where the atmosphere is hottest, vapours rising from the sea, and dispersed by pleasant breezes, render it of a moderate temperature.

The peninsula of California is now stocked with all sorts of domestic animals known in Spain and Mexico. Horses, mules, asses, oxen, sheep, hogs, goats, and all other quadrupeds imported, thrive and increase in this country. Among the native animals is a species of deer of the size of a young heifer, and greatly resembling it in shape; the head is like that of a deer, and the horns thick and crooked like those of a ram. The hoof of the animal is large, round, and cloven, the skin spotted, but the hair thinner and the tail sharper than those of a deer. Its flesh is greatly esteemed. There is another animal peculiar to this country, larger and more bulky than a sheep, but greatly resembling it in figure, and, like it, covered with a fine black or white wool. The flesh of this animal is nourishing and delicious; and, happily for the natives, it is so abundant, that nothing more is required than the trouble of hunting, as these animals wander about in droves in the forests and on the mountains. Father Torquemado describes a creature which he calls a *species of large bear*, something like a buffalo, of the size of a steer, and nearly of the figure of a stag. Its hair is a quarter of a yard in length, its neck long and aukward, and on its forehead are horns branched like those of a stag. The tail is a yard in length and half a yard in breadth; and the hoofs cloven like those of an ox. With regard to birds, we have but an imperfect account; only, in ge-

neral, Father Venegas tells us that the coast is plentifully stored with peacocks, bullards, geese, cranes, and molt of the birds common in other parts of the world. The quantity of fish which resort to these coasts are incredible. Salmon, turbot, barbel, skate, mackerel, &c. are caught here with very little trouble; together with pearl oysters, common oysters, lobsters, and a variety of exquisite shell-fish. Plenty of turtle are also caught on the coasts. On the South Sea coasts are some shell-fish peculiar to it, and perhaps the most beautiful in the world; their lustre surpassing that of the finest pearl, and darting their rays through a transparent varnish of an elegant vivid blue, like the lapis lazuli. The fame of California for pearls soon drew forth great numbers of adventurers, who searched every part of the gulph, and are still employed in that work, notwithstanding fashion has greatly diminished the value of this elegant natural production. Father Torquemado observes that the sea of California affords very rich pearl fisheries; and that the *hosiars*, or beds of oysters, may be seen in three or four fathom water, almost as plain as if they were on the surface.

The extremity of the peninsula towards Cape St Lucar is more level, temperate, and fertile, than the other parts, and consequently more woody. In the more distant parts, even to the farthest missions on the east coast, no large timber hath yet been discovered. A species of manna is found in this country, which, according to the accounts of the Jesuits, has all the sweetness of refined sugar without its whiteness. The natives firmly believe that this juice drops from heaven.

The Californians are well made, and very strong. They are extremely pusillanimous, inconstant, stupid, and even insensible, and seem extremely deserving of the character given to the Indians in general, under the article AMERICA. Before the Europeans penetrated into California, the natives had no form of religion. The missionaries indeed tell us many tales concerning them, but they so evidently bear the marks of forgery as not to be worth repeating. Each nation was then an assemblage of several cottages more or less numerous, that were all mutually confederated by alliances, but without any chief. They were strangers even to filial obedience. No kind of dress was used by the men; but the women made use of some coverings, and were even fond of ornamenting themselves with pearls and such other trinkets as the country afforded. What mostly displayed their ingenuity was the construction of their fishing nets, which are said by the Jesuits to have even exceeded in goodness those made in Europe. They were made by the women, of a coarse kind of flax procured from some plants which grow there. Their houses were built of branches and leaves of trees: nay, many of them were only inclosures of earth and stone, raised half a yard high, without any covering; and even these were so small, that they could not stretch themselves at length in them. In winter, they dwelt under ground in caves either natural or artificial.

In 1526, Ferdinand Cortez, having reduced and settled Mexico, attempted the conquest of California; but was obliged to return, without even taking a survey of the country, a report of his death having diffused the Mexicans to a general insurrection. Some other

California.

attempts were made by the officers of Cortez, but these were also unsuccessful; and this valuable coast was long neglected by the Spaniards, who, to this day, have but one settlement upon it. In 1595, a galleon was sent to make discoveries on the Californian shore; but the vessel was unfortunately lost. Seven years after, the count de Monterey, then viceroy of New Spain, sent Sebastian Biscayno on the same design with two ships and a tender; but he made no discovery of importance. In 1684, the marquis de Laguna, also viceroy of New Spain, dispatched two ships with a tender to make discoveries on the lake of California. He returned with an indifferent account, but was among the first that asserted that California was not an island; which was afterwards confirmed by Father Caino, as already related. In 1697, the Spaniards being discouraged by their losses and disappointments, the Jesuits solicited and obtained permission to undertake the conquest of California. They arrived among the savages with curiosities that might amuse them, corn for their food, and clothes for which they could not but perceive the necessity. The hatred these people bore the Spanish name could not support itself against these demonstrations of benevolence. They testified their acknowledgments as much as their want of sensibility and their inconstancy would permit them. These faults were partly overcome by the religious institutors, who pursued their project with a degree of warmth and resolution peculiar to the society. They made themselves carpenters, masons, weavers, and husbandmen; and by these means succeeded in imparting knowledge, and in some measure a taste for the useful arts, to this savage people, who have been all successively formed into one body. In 1745, they composed 43 villages, separated from each other by the barrenness of the soil and the want of water. The inhabitants of these small villages subsist principally on corn and pulse, which they cultivate; and on the fruits and domestic animals of Europe, the breeding of which last is an object of continual attention. The Indians have each their field, and the property of what they reap; but such is their want of foresight, that they would squander in a day what they had gathered, if the missionary did not take upon himself to distribute it to them as they stand in need of it. They manufacture some coarse stuffs; and the necessities they are in want of are purchased with pearls, and with wine nearly resembling that of Madeira, which they sell to the Mexicans and to the galleons, and which experience hath shewn the necessity of prohibiting in California. A few laws, which are very simple, are sufficient to regulate this rising state. In order to enforce them, the missionary chooses the most intelligent person of the village; who is empowered to whip and imprison, the only punishments of which they have any knowledge. In all California there are only two garisons, each consisting of 30 men, and a soldier with every missionary. These troops were chosen by the legislators, though they are paid by the government. Were the court of Madrid to push their interest with half the zeal of the Jesuits, California might become one of the most valuable of their acquisitions, on account of the pearls and other valuable articles of commerce which the country contains. At present the little Spanish town near Cape St. Lucar is made use of for no other purpose than as a place of refreshment for the

Manila ship, and the head residence of the missionaries.

CALIGULA, the Roman emperor and tyrant, A. D. 37, began his reign with every promising appearance of becoming the real father of his people; but at the end of eight months he was seized with a fever, which, it is thought, left a frenzy on his mind: for his disposition totally changed, and he committed the most atrocious acts of impiety, cruelty, and folly; such as proclaiming his horse consul, feeding it at his table, introducing it to the temple in the vestments of the priests of Jupiter, &c. and causing sacrifices to be offered to himself, his wife, and the horse. After having murdered many of his subjects with his own hand, and caused others to be put to death without any just cause, he was assassinated by a tribune of the people as he came out of the amphitheatre, A. D. 41, in the 29th year of his age, and 4th of his reign.

CALIN, a compound metal, whereof the Chinese make tea-canisters, and the like. The ingredients seem to be lead and tin.

CALIPH, or KHALIF, the supreme ecclesiastical dignity among the Saracens; or, as it is otherwise defined, a sovereign dignity among the Mahometans, vested with absolute authority in all matters relating both to religion and policy. In the Arabic it signifies *successor* or *vicar*; the caliphs bearing the same relation to Mahomet that the popes pretend they do to Jesus Christ or St Peter. It is at this day one of the Grand Signior's titles, as successor of Mahomet; and of the Sophi of Persia, as successor of Ali. One of the chief functions of the caliph, in quality of imam or chief priest of Mussulmanism, was to begin the public prayers every Friday in the chief mosque, and to deliver the *khothbak* or sermon. In after-times, they had assistants for this latter office; but the former the caliphs always performed in person. The caliph was also obliged to lead the pilgrims to Mecca in person, and to march at the head of the armies of his empire. He granted investitures to princes; and sent swords, standards, gowns, and the like, as presents to princes of the Mahometan religion; who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals. The caliphs usually went to the mosque mounted on mules; and the sultans selgiucides, though masters of Bagdad, held their stirrups, and led their mule by the bridle some distance on foot, till such time as the caliphs gave them the sign to mount on horseback. At one of the windows of the caliph's palace, there always hung a piece of black velvet 20 cubits long, which reached to the ground, and was called the *caliph's sleeve*; which the grandees of his court never failed to kiss, every day, with great respect. After the destruction of the caliphate by Hulaku *, the Mahometan princes appointed a particular officer, in their respective dominions, who sustains the sacred authority of caliph. In Turkey, he goes under the denomination of *mufiti*, and in Persia under that of *fadne*.

CALIPHATE, the office or dignity of caliph: See the preceding article. The succession of caliphs continued from the death of Mahomet till the 655th year of the Hegira, when the city of Bagdad was taken by the Tartars. After this, however, there were persons who claimed the caliphate, as pretending to be of the family of the Abbasides, and to whom the sultans of Egypt rendered great honours at Cairo, as the true

and Turkey.

true successors of Mahomet: but this honour was merely titular, and the rights allowed them only in matters relating to religion; and though they bore the sovereign title of *caliphs*, they were nevertheless subjects and dependents of the sultans. - In the year of the Hegira 361, a kind of caliphate was erected by the Fatemites in Africa, and lasted till it was suppressed by Saladdin *. - Historians also speak of a third caliphate in Gemen or Arabia Felix, erected by some princes of the family of the Jobites. The emperors of Morocco assume the title of *grand sherifs*; and pretend to be the true caliphs, or successors of Mahomet, though under another name.

CALISTA, in fabulous history, the daughter of Lycaon king of Arcadia, and one of the nymphs of Diana; who being beloved by Jupiter, that god assumed the form of the goddess of chastity, by which means he debauched her: but her disgrace being revealed, as she was bathing with her patroness, the incensed deity turned her and the son, with which she was pregnant, into bears; when Jupiter, in compassion to her sufferings, took them up into the heavens, and made them the constellations Ursa Major and Ursa Minor.

CALIX. See CALYX.

CALIXTINS, in church-history, a sect of Christians in Bohemia and Moravia: the principal point in which they differed from the church, was the use of the chalice, or communicating in both kinds.

CALIXTINS, is also a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, who opposed the opinion of St Augustine on predestination, grace, and free-will.

CALKA, a kingdom of Tartary, in Asia, to the east of Siberia.

CALKING. See CAULKING.

CALKINS, the prominent parts at the extremities of a horse-shoe, bent downwards, and forged to a sort of point.

Calkins are apt to make horses slip; they also occasion blyemes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas the great square calkins quite spoil the foot.

Calkins are either single or double, that is, at one end of the shoe, or at both: these last are deemed less hurtful, as the horses can tread more even.

CALL, among hunters, a lesson blown upon the horn, to comfort the hounds.

CALL, among sailors, a sort of whistle or pipe, of silver or brass, used by the boatwain and his mates to summon the sailors to their duty, and direct them in the different employments of the ship. As the call can be founded to various strains, each of them is appropriated to some particular exercise; such as hoisting, heaving, lowering, veering away, belaying, letting go a tackle, &c. The act of winding this instrument is called *pipings*, which is as attentively observed by sailors as the beat of the drum to march, retreat, rally, charge, &c. is obeyed by soldiers.

CALL, among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling-time. One method of catching partridges is by the natural call of a hen trained for the purpose, which drawing the cocks to her, they are entangled in a net. Different birds require different sorts of calls; but they are

most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or swan's quill, &c. to be blown with the mouth, to make the noise of the cock-partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern pipe in shape like a pear, stuffed with horse-hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flageolet. They are play'd, by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb, to counterfeite the call of the hen-quail.

CALLA, WAKE-ROBIN, or *Ethiopian Arum*; a genus of the polyandria order, belonging to the gynandria class of plants. Of this there is but one species. It hath thick, fleshy, tubercous roots, which are covered with a thin brown skin, and strike down many strong fleshy fibres into the ground. The leaves have footstalks more than a foot long, which are green and succulent. The leaves are shaped like the point of an arrow; they are eight or nine inches in length, ending in a sharp point, which turns backward; between the leaves arise the footstalk of the flower, which is thick, smooth, of the same colour as the leaves, rises above them, and is terminated by a single flower, shaped like those of the arum, the hood or spathe being twisted at bottom, but spreads open at the top, and is of a pure white colour. When the flowers fade, they are succeeded by roundish fleshy berries, compressed on two sides, each containing two or three seeds. This plant grows naturally at the Cape of Good Hope. It propagates very fast by offsets, which should be taken off in the latter end of August, at which time the old leaves decay; for at this time the roots are in their most inactive state. They are so hardy as to live without any cover in mild winters, if planted in a warm border and dry soil; but, with a little shelter in hard frost, they may be preserved in full growth very well.

CALLA-Sufung, a town of Asia, in the island of Bouton in the East Indies. It is seated about a mile from the sea, on the top of a small hill surrounded with coconut-trees. See BOUTON.

CALLAO, a strong town of South America, in Peru. It is the port of Lima, from which it is distant about five miles. The town is built on a low flat point of land on the sea-shore. It is fortified; but the fortifications were much damaged by the last great earthquake, and have not since been repaired. The town is not above nine or ten feet above the level of high-water mark; but the tide does not commonly rise or fall above five feet. The streets are drawn in a line; but are full of dust, which is very troublesome. In a square near the sea-side are the governor's house, the viceroy's palace, the parish-church, and a battery of three pieces of cannon. On the north side are the warehouses for the merchandise brought from Chili, Mexico, and other parts of Peru. The other churches are built with reeds, and covered with timber or clay, but they look tolerably neat. There are five monasteries and an hospital, though the number of families does not exceed 400. The trade of Callao is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn;

from

Callos
Callimachus

Calling
Callipædia.

from Chiloe, cedar-planks, woollen manufactures, and carpets; from Peru, sugars, wines, brandy, malts, cordage, timber for shipping, cacao, tobacco, and molasses; from Mexico, pitch, tar, woods for dyeing, sulphur, balsam of Peru both white and brown, as well as commodities from China. At the port of Callao the watering is easy, but the wood is a mile or two distant. Earthquakes are very frequent in these parts, which have done vast mischief to Lima and Callao. W. Long, 76. 15. S. Lat. 12. 29.

CALLE, (anc. geog.), a town of Hither Spain, situated on an eminence which hangs over the river Durus; whose port was at the mouth of the river. Now *Porto, Oporto, or Port a Port*. See *Oporto*.

CALLEN, a town of Ireland, in the county of Kilkenny and province of Leinster, about ten miles south-west of Kilkenny. W. Long, 7. 22. N. Lat. 52. 25.

CALLICARPA. See *JOHNSONIA*.

CALLICO, in commerce; a kind of cloth made of cotton, chiefly in the East Indies. Some of them are painted with various flowers of different colours: others are not stained, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tulle of gold, silver, and silk, intermixed with flowers. This manufacture is brought hither by the East-India company, and is re-exported by merchants to other parts of Europe. The general wear of stained or printed India calicoes in this nation having become a general grievance, and occasioning unspeakable distress upon our own manufactures, they were prohibited by stat. 7 Geo. I. cap. vii.

CALLICRATES, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the wing of a fly, and an ant of ivory in which all the members were distinct: but Ælian justly blames him for exerting his genius and talents in things so useless, and at the same time so difficult. He flourished about the year 472 before Christ.

CALLIGRAPHUS, in antiquity, a copist or scrivener, who transcribed in a fair hand what the notaries had taken down in notes or minutes, being generally in a kind of cipher or short-hand, which, as they were in that hand, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c.

CALLIMACHUS, a celebrated architect, painter, and sculptor, born at Corinth, having been by accident a vessel about which the plant called *acanthus* had raised its leaves, conceived the idea of forming the Corinthian capital. (See *ACANTHUS*, and Plate XXV. (s). fig. 4.) The ancients assure us, that he worked in marble with wonderful delicacy. He flourished about 540 B. C.

CALLIMACHUS, a celebrated Greek poet, native of Cyrene in Libya, flourished under Ptolemy Philadelphus and Ptolemy Evergetes kings of Egypt, about 280 years before Christ. He passed, according to Quintilian, for the prince of the Greek elegiac poets. His style is elegant, delicate, and nervous. He wrote a great number of small poems, of which we have only some hymns and epigrams remaining. Catullus has closely imitated him, and translated into Latin verse his small poem on the locks of Berenice. Callimachus

was also a good grammarian and a learned critic. There is an edition of his remains, by Mest. le Fèvre, quarto; and another in two volumes octavo, with notes by Spanheim, Grævius, Bentley, &c.

CALLING *the House*, in the British parliament, is the calling over the members named, every one answering to his own, and going out of the house, in the order in which he is called: this they do in order to discover whether there be any persons there not returned by the clerk of the crown, or if any member be absent without leave of the house.

CALLINICUS of Heliopolis, inventor of a composition to burn in the water, called the *Greek*, and since *Wild, Fire*. See *Grecian FIRE*.

CALLINUS of Ephesus, a very ancient Greek poet, inventor of elegiac verse; some specimens of which are to be found in the collection of Stobæus. He flourished about 776 years before Christ.

CALLIONYMUS, the *DRAGONET*, in ichthyology, a genus of fishes belonging to the order of jugulares. The upper lip is doubled up; the eyes are very near each other; the membrane of the gills has six radii; the operculum is shut; the body is naked; and the belly-fins are at a great distance from each other. There are three species of callionymus, viz. 1. The *lyra*, with the first bone of the back-fin as long as the body of the animal, and a cirrus at the anus. It is found as far north as Norway and Spitzbergen, and as far south as the Mediterranean sea, and is not unfrequent on the Scarborough coasts, where it is taken by the hook in 30 or 40 fathoms water. It is often found in the stomach of the cod-fish. 2. The *dracunculus*, with the first bone of the back-fin shorter than its body, which is of a spotted yellow colour. It frequents the shores of Genoa and Rome. 3. The *indicus* has a smooth head, with longitudinal wrinkles; the lower jaw is a little longer than the upper one; the tongue is obtuse and emarginated; the apertures of the gills are large: it is of a livid colour, and the anus is in the middle of the body. It is a native of Asia.

CALLOPE, in the Pagan mythology, the muse who presides over eloquence and heroic poetry. She was thus called from the sweetness of her voice, and was reckoned the first of the nine sisters.

CALLIPÆDIA, the art of getting or breeding fine and beautiful children. We find divers rules and practices relating to this art, in ancient and modern writers. Among the magi, a sort of medicine called *ermesia* was administered to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine-nuts ground with honey, myrrh, saffron, palm-wine and milk. The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child placed at the door of the public baths, that the women at going out being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take still greater care of their breeding women, to prevent uncouth objects of any kind from striking their imagination. Musicians are employed at night to entertain them with agreeable songs and odes, in which are set forth all the duties and comforts of a conjugal and domestic life; that the infant may receive good impressions even before it is born, and not only come forth agreeably formed in body,

but

Callipolis
||
Callot.

but well disposed in mind. Callipædia, nevertheless, seems to have been first erected into a just art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of *Calvidus Latus*, has published a fine Latin poem in four books, under the title of *Callipædia, seu de pulcherræ proliis habenda ratione*; wherein are contained all the precepts of that new art. There is a translation of it into English verse, by Mr Rowe.

CALLIPOLIS, (anc. geog.), the name of several cities of antiquity, particularly one upon the Hellespont, next the Propontis, and opposite to Lampacus in Asia. Now **GALLIOLI**.

CALLIPPIC PERIOD, an improvement of the cycle of Meton, of 19 years, which Callippus the Grecian astronomer, finding in reality to contain 19 of Nabonassar's years, four days, and $\frac{1}{4}$, he, to avoid fractions, quadrupled the golden number, and by that means made a new cycle of 76 years; which time being expired, he supposed the lunation, or changes of the moon, would happen on the same day of the month and hour of the day that they were on 76 years before.

CALLIPPUS, a celebrated Athenian astronomer, and the first observer of the revolutions of eclipses, flourished 336 years before Christ.

CALLIRHOE, (anc. geog.), surnamed *Enneacrunos*, from its nine springs or channels; a fountain not far from Athens, greatly adorned by Pisistratus, where there were several wells, but this only the running spring. Callirhoe was also the name of a very fine spring of hot water beyond Jordan near the Dead Sea, into which it empties itself.

CALLISTEA, in Grecian antiquity, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest. There was another of these contentions at the festival of Ceres Eleusinia among the Parrhasians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied by his friends, who adorned him with ribbons, and crowned him with a garland of myrtle.

CALLISTHENES the philosopher, disciple and relation of Aristotle, by whose desire he accompanied Alexander the Great in his expeditions; but proving too severe a censor of that hero's conduct, he was put by him to the torture (on suspicion of a treasonable conspiracy), and died under it, 328 years before Christ.

CALLISTRATUS, an excellent Athenian orator, was banished for having obtained too great an authority in the government. Demosthenes was so struck with the force of his eloquence, and the glory it procured him, that he abandoned Plato, and resolved from thenceforward to apply himself to oratory.

CALLOO, a fortress in the Netherlands, in the territory of Waes, on the river Scheld, subject to the house of Austria. The Dutch were defeated here by the Spaniards in 1638. E. Long. 4. 10. N. Lat. 51. 15.

CALLOSUM CORPUS, in anatomy, a whitish hard substance, joining the two hemispheres of the brain, and appearing in view when the two hemispheres are drawn back. See **ANATOMY**, n^o 397.

CALLOT (James), a celebrated engraver born at Nancy in 1593. In his youth he travelled to Rome to learn designing and engraving; and from thence went

Callot
||
Calmet.

to Florence, where the grand duke took him into his service. After the death of that prince, Callot returned to his native country; when he was very favourably received by Henry duke of Lorraine, who settled a considerable pension upon him. His reputation being soon after spread all over Europe, the infants of the Netherlands drew him to Brussels, where he engraved the siege of Breda. Lewis XIII. made him design the siege of Rochelle, and that of the isle of Rhe. The French king, having taken Nancy in 1631, made Callot the propofal of representing that new conquest, as he had already done the taking of Rochelle: but Callot begged to be excused; and, some courtiers resolving to oblige him to do it, he answered, that he would sooner cut off his thumb than do any thing against the honour of his prince and country. This excuse the king accepted; and said, that the duke of Lorraine was happy in having such faithful and affectionate subjects. Callot followed his business so closely, that, though he died at 43 years of age, he is said to have left 1380 pieces of his own execution. Mr Evelyn, in his *Sculptura*, gives him a very exalted character in his art.

CALLUS, or **CALLOSTY**, in a general sense, any cutaneous, corneous, or osseous hardness, whether natural or preternatural; but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon. A callus, in this last sense, is a sort of jelly, or liquid viscous matter, that sweats out from the small arteries and bony fibres of the divided parts, and fills up the chinks or cavities between them. It first appears of a cartilaginous substance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence with this part, than with those which were never broken.

CALLUS is also a hard, dense, insensible knob, rising on the hands, feet, &c. by much friction and pressure against hard bodies.

CALM, the state of rest which appears in the air and sea when there is no wind stirring. That tract of the Atlantic ocean situated between the tropic of Cancer and the latitude of 29° north, or the space that lies between the trade and the variable winds, is frequently subject to calms of very long duration; and hence it has acquired amongst seamen the name of the *calm latitudes*.

CALMAR, a strong sea-port of Sweden, in the province of Smaland, divided into two towns, the old and the new; but of the former there remains only the church and a few houses. The new town is built a little way from the other, and has large handsome houses. E. Long. 16. 15. N. Lat. 56. 40.

CALMET (Augustine), one of the most learned and laborious writers of the 18th century, was born at Mefnil le Horgne, a village in the diocese of Toul in France, in the year 1672, and took the habit of the Benedictines in 1688. Among the many works he published, are, 1. A literal exposition, in French, of all the books in the Old Testament, in nine volumes folio.

2. A historical, critical, chronological, geographical, and literal, dictionary of the Bible, in four vols folio, enriched with a great number of figures of Jewish antiquities. 3. A civil and ecclesiastical history of Lorraine, three vols folio.

|
Caltha.

Caltrop
|
Calvert.

folio. 4. A history of the Old and New Testament, and of the Jews, in two volumes folio, and seven vols duodecimo. 5. An universal sacred and profane history, in several volumes quarto. He died in 1757.

CALMUCKS. See KALMUCKS.

CALNE, a town of Wiltshire in England, seated on a river of the same name. It has a handsome church, and sends two members to parliament. W. Long. 1. 59. N. Lat. 51. 30.

CALOGERI, in church-history, monks of the Greek church, divided into three degrees: the novices, called *archari*; the ordinary professed, called *nichrochemi*; and the more perfect, called *mogulochemi*: they are likewise divided into cœnobites, anchorites, and recluses. The cœnobites are employed in reciting their offices from midnight to sun-set; they are obliged to make three genuflexions at the door of the choir, and, returning, to bow to the right and to the left, to their brethren. The anchorites retire from the conversation of the world, and live in hermitages in the neighbourhood of the monasteries; they cultivate a little plot of ground, and never go out but on Sundays and holidays to perform their devotions at the next monastery. As for the recluses, they shut themselves up in grottos and caverns on the tops of mountains, which they never go out of, abandoning themselves entirely to Providence: they live on the alms sent them by the neighbouring monasteries.

CALOMEL, or dulcified sublimate of mercury. See PHARMACY, n^o 760—763.

CALOTTE, a cap or coif of hair, fatten, or other stuff; an ecclesiastical ornament in most Popish countries. See CAP.

CALOTTE, in architecture, a round cavity or depression, in form of a cap or cup, lathed and plastered, used to diminish the rise or elevation of a moderate chapel, cabinet, alcove, &c. which, without such an expedient, would be too high for other pieces of the apartment.

CALPE, a mountain of Andalusia in Spain; at the foot of which, towards the sea, stands the town of Gibraltar. It is half a league in height towards the land, and so steep that there is no approaching it on that side.

CALPURNIUS (Titus), a Latin Sicilian poet, lived under the emperor Carus and his son. We have seven of his eclogues remaining.

CALQUING, or CALKING, a term used in painting, &c. where the back-side of any thing is covered over with a black or red colour, and the strokes or lines traced through, on a waxed plate, wall, or other matter, by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

CALTHA, MARSH-MARIGOLD; a genus of the digynia order, belonging to the polyandria class of plants. There is only one species known, which grows naturally in moist boggy lands in many parts of England and Scotland. There is a variety, with very double flowers, which for its beauty is preserved in gardens. It is propagated by parting the roots in autumn. It should be planted in a moist soil and shady situation; and as there are often such places in gardens where few other plants will thrive, so these may be allowed room, and during their season of flowering will afford

an agreeable variety. The flowers gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little alum, stains paper yellow. The remarkable yellowness of the butter in spring is supposed to be caused by this plant: but cows will not eat it, unless compelled by extreme hunger; and then, Boerhaave says, it occasions such an inflammation, that they generally die. Upon May-day, the country people threw the flowers upon the pavement before their doors. Goats and sheep eat this plant; horses, cows, and swine, refuse it.

CALTROP, in botany. See TRIBULUS.

CALTROP, in military affairs, an instrument with four iron points, disposed in a triangular form, so that three of them are always on the ground, and the fourth in the air. They are scattered over the ground where the enemy's cavalry is to pass, in order to embarrass them.

CALVARIA, in anatomy, the hairy scalp or upper part of the head, which, either by disease or old age, grows bald first.

CALVART (Denis), a celebrated painter, was born at Antwerp in 1552; and had for his masters Prospero Fontana and Lorenzo Sabbatini. He opened a school at Bologna, which became celebrated; and from which proceeded Guido, Albani, and other great masters. Calvart was well skilled in architecture, perspective, and anatomy, which he considered as necessary to a painter, and taught them to his pupils. His principal works are at Bologna, Rome, and Reggio. He died at Bologna in 1619.

CALVARY, a term used in Catholic countries for a kind of chapel of devotion raised on a hillock near a city, in memory of the place where Jesus Christ was crucified near the city of Jerusalem. The word comes from the Latin *calvarium*; and that from *calvus*, bald; in regard the top of that hillock was bare and destitute of verdure: which is also signified by the Hebrew word *golgotha*. Such is the Calvary of St Valerian near Paris; which is accompanied with several little chapels, in each of which is represented in sculpture one of the mysteries of the passion.

CALVARY, in heraldry, a cross so called, because it resembles the cross on which our Saviour suffered. It is always set upon steps.

CALVERT (George), afterwards lord Baltimore, was born at Kipling in Yorkshire about the year 1582, and educated at Oxford, where he took the degree of bachelor of arts, and afterwards travelled. At his return, he was made secretary to Sir Robert Cecil: he was afterwards knighted, and in 1618 appointed one of the principal secretaries of state. But after he had enjoyed that post about five years, he willingly resigned it; freely owning to his majesty that he was become a Roman-catholic, so that he must either be wanting to his trust, or violate his conscience in discharging his office. This ingenious confession so affected king James, that he continued him privy-counsellor all his reign, and the same year created him baron of Baltimore in the kingdom of Ireland. He had before obtained a patent for him and his heirs, for the province of Avelon in Newfoundland; but that being exposed to the insults of the French, he abandoned it, and afterwards obtained the grant of a country on the north part of Virginia from Charles I. who called it *Maryland*, in honour of his queen:

Calvi,
Calvin.

queen: but he died in April 1632 (aged 50), before the patent was made out. It was, however, filled up to his son Cecil Calvert lord Baltimore; and bears date June 20th 1632. It is held from the crown as part of the manor of Windfor, on one very singular condition, viz. to present two Indian arrows yearly, on Easter Tuesday, at the castle, where they are kept and shewn to visitors.—His lordship wrote, 1. A Latin poem on the death of Sir Henry Upton. 2. Speeches in parliament. 3. Various letters of state. 4. The answer of Tom Tell-truth. 5. The practice of princes. And, 6. The lamentation of the kirk.

CALVI, a town of the province of Lavoro, in the kingdom of Naples, situated near the sea, about fifteen miles north of the city of Naples. E. Long. 14. 45. N. Lat. 41. 15.

CALVI is also the name of a sea-port in the island of Corfica, situated on a bay, on the west side of the island, about 40 miles south-west of Baffia. E. Long. 9. 5. N. Lat. 42. 16.

CALVIN (John), the celebrated reformer of the Christian church from Romish superstitions and doctrinal errors, and founder of the sect since called *Calvinists*, was born in 1509. He was the son of a cooper of Noyon in Picardy; and his real name was *Chauvin*, which he chose to latinize into *Calvinus*, tyling himself in the title-page to his first work, (a Commentary on *Seneca de clementia*), “*Lucius Calvinus, Civis Romanus*,” an early proof of his pride, at about 24 years of age. In 1529, he was rector of Pont l’Eveque; and in 1534 he threw up this benefice, separating himself entirely from the Romish church. The persecution against the Protestants in France (with whom he was now associated) obliged him to retire to Basle in Switzerland: here he published his famous Institutes of the Christian religion in 1535. The following year, he was chosen professor of divinity, and one of the ministers of the church, at Geneva. The next year, viz. 1537, he made all the people solemnly swear to a body of doctrines; but finding that religion had not yet had any great influence on the morals of the people, he, assisted by other ministers, declared, that since all their admonitions and warnings had proved unsuccessful, they could not celebrate the holy sacrament as long as these disorders reigned; he also declared, that he could not submit to some regulations made by the synod of Berne. Upon which the Syndics having summoned the people, it was ordered that Calvin and two other ministers should leave the city within two days. Upon this, Calvin retired to Strasburg, where he established a French church, of which he was the first minister, and was also chosen professor of divinity there. Two years after, he was chosen to assist at the diet appointed by the emperor to meet at Worms and at Ratibon in order to appease the troubles occasioned by the difference of religion. He went with Bucer, and entered into a conference with Melancthon. The people of Geneva now intreated him to return; to which he consented, and arrived at Geneva, Sept^r 13th 1541. He began with establishing a form of ecclesiastical discipline, and a consistorial jurisdiction, with the power of inflicting all kinds of canonical punishments. This was greatly disliked by many persons, who imagined that the papal tyranny would soon be revived. Calvin, however, asserted on all occasions the rights of his consistory with

VOL. III.

inflexible strictness; and he caused Michael Servetus to be burnt at the stake for writing against the doctrine of the Trinity. But though the rigour of his proceedings sometimes occasioned great tumults in the city, yet nothing could shake his steadiness and inflexibility. Amongst all the disturbances of the commonwealth, he took care of the foreign churches in England, France, Germany, and in Poland; and did more by his pen than his presence, sending his advice and instructions by letter, and writing a great number of books. This great reformer died on the 27th of May 1564, aged 55. His works were printed together at Amsterdam in 1671, in nine volumes folio: the principal of which are his Institutes, in Latin, the best edition of which is that of Robert Stephens in 1553, in folio; and his Commentaries on the Holy Scriptures.—Calvin is universally allowed to have had great talents, an excellent genius, and profound learning. His style is grave and polite. Independent of his spiritual pride, his morals were exemplary; for he was pious, sober, chaste, laborious, and disinterested. But his memory can never be purified from the stain of burning Servetus: it ill became a reformer to adopt the most odious practice of the corrupt church of Rome.

CALVINISTS, in church-history, those who follow the opinions of CALVIN; whose doctrine still subsists in its greatest purity at Geneva, where it was first broached, and from whence it was propagated. This is the prevailing religion of the United Provinces. In England, it is confined among the dissenters; and in Scotland it is the only orthodox faith.

The Calvinists are great advocates for the absoluteness of God’s decrees; and hold, that election and reprobation depend on the mere will of God, without any regard to the merit or demerit of mankind; that he affords to the elect an irresistible grace, a faith that they cannot lose, which takes away the freedom of will, and necessitates all their actions to virtue.

The Calvinists believe that God foreknew a determinate number, whom he pitched upon to be persons in whom he would manifest his glory; and that, having thus foreknown them, he predestinated them to be holy, in order to which he gives them an irresistible grace, which makes it impossible for them to be otherwise.

CALVISIUS (Seth), a celebrated German chronologer in the beginning of the 17th century. He wrote *Elenchus calendarii Gregoriani, et duplex calendarii melioris forma*, and other learned works, together with some excellent treatises on music.

CALVITIES, or CALVITIUM, in medicine, baldness, or a want of hair, particularly on the scalp, occasioned by the moisture of the head, which should feed it, being dried up, by some disease, old age, or the immoderate use of powder, &c. See ALOPECIA.

CALUMET, a symbol of peace among the Indians, in the north of America. It is made of a red stone, like our marble: the head resembles our tobacco-pipes, but larger; and is fixed on a hollow reed, to hold it for smoking: they adorn it with fine wings of several colours, and is the calumet of the sun, to whom they present it, especially if they want fair weather, or rain. This pipe is a pass and safe conduct amongst all the allies of the nation who has given it: in all embassies the ambassador carries it as an emblem of peace, and it always meets with a profound regard; for the savages

Calvinists
||
Calumet.

Calumny
||
Calydon.

are generally persuaded, that a great misfortune would befall them, if they violated the public faith of the calumnet.

CALUMNY, the crime of accusing another falsely, and knowingly so, of some heinous offence.

Oath of Calumny, Juramentum (or rather *Jurjurandum*) *Calumnie*, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken *pro confesso*. This custom was taken from the ancient athlete; who, before they engaged, were to swear that they had no malice, nor would use any unfair means for overcoming each other. The *juramentum calumnie* is much disused, as a great occasion of perjury. Anciently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice *.

CALVUS (Cornelius Licinius), a celebrated Roman orator, was the friend of Catullus; and flourished 64 B. C. Catullus, Ovid, and Horace, speak of him.

CALX properly signifies *lime*, but is also used by chemists and physicians for a fine powder remaining after the calcination or corrosion of metals and other mineral substances. All metallic calces, at least all those made by fire, are found to weigh more than the metal from which they were originally produced: for a full explication of this phenomenon, see the article **FIRE**.

CALX Antimonii. See **PHARMACY**, n° 773.

CALX Nativa, in natural history, a kind of marly earth, of a dead whitish colour, which, if thrown into water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime or plaster of Paris.

CALX Viva, or *Quick-lime*, that whereon no water has been cast, in contradistinction to lime which has been slaked by pouring water on it. See **CHEMISTRY**, n° 34.

CALYCANTHEMÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. epilobium, crenothera, justicia, ludwigia, oldenlandia, isinardas, &c. See **BOTANY**, sect. vi. 17.

CALYCIFLORÆ, in botany, the 16th order in Linnæus's *Fragmenta methodi naturalis*, consisting of plants which, as the title imports, have the stamina (the flower) inserted into the calyx. This order contains the following genera, viz. cleagnus, hippophae, ostrya, and trophis. See **BOTANY**, sect. vi. 16.

CALYCISTÆ, (from *calyx* the flower-cup), systematic botanists, so termed by Linnæus, who have arranged all vegetables from the different species, structure, and other circumstances, of the calyx or flower-cup. The only systems of this kind are the *Character plantarum novus*, a posthumous work of Magnolius, professor of botany at Montpellier, published in 1720; and Linnæus's *Methodus calycina*, published in his *Classes plantarum*, at Leyden, in 1738. See **BOTANY**, p. 1290.

CALYDON, (anc. geog.), a town of Ætolia, situated seven miles and a half from the sea, and divided

by the river Evenus: the country was anciently called *Æolia*, from the Æolians its inhabitants. This country was famous for the story of Meleager and the Calydonian boar.

CALYPSO, in fabulous history, a goddess, who was the daughter of Oceanus and Tethys, or, as others say, of Atlas. She was queen of the island of Ogygia, which from her was called the island of *Calypsø*. According to Homer, Ulysses suffered shipwreck on her coast, and staid with her several years.

CALYPTRA, among botanists, a thin membranaceous involucre, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptræ.

CALYX, among botanists, a general term expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower.

The cups of flowers are very various in their structure, and on that account distinguished by several names, as *perianthium*, *involucreum*, *spatha*, *gluma*, &c. *

CALZADA, a town of Old Castile in Spain, seated on the river Leglera. W. Long. 2. 47. N. Lat. 42. 12.

CAMEÆA, in natural history, a genus of the semipellucid gems, approaching to the onyx structure, being composed of zones, and formed on a crystalline basis; but having their zones very broad and thick, and laid alternately one on another, with no common matter between; usually less transparent, and more debased with earth, than the onyxes.

1. One species of the cameæa is the dull-looking onyx, with broad black and white zones; and is the cameæa of the moderns, and the Arabian onyx. This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the cameæa is the dull, broad-zoned, green and white cameæa, or the jaspinecameo of the Italians: it is found in the East Indies, and in some parts of America. 3. The third is the hard cameæa, with broad white and chestnut-coloured veins. 4. The hard cameæa, with bluish, white, and flesh-coloured broad veins, being the sardonnyx of Pliny's time, only brought from the East Indies.

CAMAIËU, or **CAMAYEU**, a stone whereon are found various figures and representations of landscapes, formed by a kind of lusus nature, so as to exhibit pictures without painting. The word comes from *camebula*, a name the orientals give to the onyx, when they find, in preparing it, another colour; as who should say, *a second stone*. The Latins call it *cameus*; the Italians, *cameo*. It is of these camaiæux that Pliny is to be understood, when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones *.

CAMALDULIANÆ, a religious order founded by St Romauld, in a little plain on the mount Apennine, called *Camaldolia*, situated in the state of Florence.

The manner of life first enjoined this order was, that they dwelt in separate cells, and met together only at the time of prayer: some of them, during the two lasts of the year, observed an inviolable silence; and others, for the space of an hundred days. On Sundays and Thursdays they fed on herbs, and the rest of the week only on bread and water. These constitutions were, however, a little moderated some time afterwards. This hermitage is now accounted very rich.

CAMARANA, an island of Arabia, in the Red Sea, whose inhabitants are little and black. It is the best

Cambodia.

best of all the islands in this sea, and here they fish for coral and pearls. N. Lat. 15. 0.

CAMAYEU. See CAMAIEU.

CAMBAIA, or CAMPAY, a town of Asia, in India, and in the peninsula on this side the Ganges; capital of a province of the same name; but more commonly called *Guzarat*. It is seated at the bottom of a gulph of the same name, on a small river; is a large place with high walls, and has a pretty good trade. The product and manufactures are inferior to few towns in India: for it abounds in corn, cattle, and silk; and cornelian and agate stones are found in its rivers. The inhabitants are noted for embroidery; and some of their quilts have been valued at 40*l*. It is subject to the Great Mogul. E. Long. 72. 15. N. Lat. 22. 30.

CAMBER, according to our monkish historians, one of the three sons of Brutus, who, upon his father's death, had that part of Britain assigned him for his share, called from him *Cambria*, now *Wales*.

CAMBER-Beam, among builders, a piece of timber in an edifice cut archwise, or with an obtuse angle in the middle, commonly used in platforms, as church-leads, and on other occasions where long and strong beams are required.

CAMBERED-DECKS, among ship-builders. The deck or flooring of a ship is said to be cambered, or to lie cambering, when it is higher in the middle of the ship's length, and droops toward the stem and stern, or the two ends. Also when it lies irregular; a circumstance which renders the ship very unfit for war.

CAMBERT, a French musician in the 17th century, was at first admired for the manner in which he touched the organ, and became superintendant of the music to Anne of Austria the queen-mother. The abbe Perrin associated him in the privilege he obtained of his majesty, of setting up an opera in 1669. Cambert set to music two pastorals, one entitled *Pomona*, the other *Ariadne*, which were the first operas given in France. He also wrote a piece entitled *The pains and pleasures of love*. These pieces pleased the public; yet, in 1672, Lully obtaining the privilege of the opera, Cambert was obliged to come to England, where he became superintendant of the music to king Charles II. and died there in 1677.

CAMBLET, or CAMLET, a plain stuff composed of a warp and a woof, which is manufactured on a loom with two treddles, as linens and flannels are.

There are camblets of several sorts: some of goat's hair, both in the warp and woof; others in which the warp is of hair, and the woof half hair and half silk; others again in which both the warp and the woof are of wool; and, lastly, some in which the warp is of wool, and the woof of thread. Some are dyed in thread, others in the piece, others are marked and mixed; some are striped, some waved or watered, and some figured.

Camblets are proper for several uses, according to their different kinds or qualities: some serve to make garments both for men and women; some for bed-curtains; others for household furniture, &c.

CAMBODIA, a kingdom of Asia, in the East Indies, bounded on the north by the kingdom of Laos, on the east by Cochin-China and Chiapa, and on the south and west by the gulph and kingdom of Siam; divided by a large river called *Mecon*. The capital town is of the same name, seated on the western shore

of the said river, about 150 miles north of its mouth. This country is annually overflowed in the rainy season, between June and October; and its productions and fruits are much the same with those usually found between the tropics. E. Long. 104. 15. N. Lat. 12. 40.

CAMBRAY, an archiepiscopal city, the capital of the Cambrisis, in the Low Countries, seated on the Scheld. It is defended by good fortifications, and has a fort on the side of the river; and as the land is low on that side, they can lay the adjacent parts under water, by means of sluices. Its ditches are large and deep, and those of the citadel are cut into a rock. Clodion became master of Cambray in 445. The Danes burnt it afterwards; since which time it became a free imperial city. It has been the subject of contest between the emperors, the kings of France, and the earls of Flanders. Francis I. let it remain neutral during the war with Charles V. but this last took possession of it in 1543. After this it was given to John of Montluc by Henry III. of France, whom he created prince of Cambray; but the Spaniards took it from Montluc in 1593, which broke his heart. It continued under the dominion of the House of Austria till 1677, when the king of France became master of it, in whose hands it has continued ever since.

The buildings of Cambray are tolerably handsome, and the streets fine and spacious. The place or square for arms is of an extraordinary largeness, and capable of receiving the whole garrison in order of battle. The cathedral dedicated to the Virgin Mary is one of the finest in Europe. The body of the church is very large, and there are rich chapels, the pillars of which are adorned with marble tombs, that are of exquisite workmanship, and add greatly to the beauty of the place. There are two galleries, one of which is of copper, finely wrought. The door of the choir is of the same metal, and well carved. The steeple of this church is very high, and built in the form of a pyramid; and from its top you have a view of the city, which is one of the finest and most agreeable in the Low Countries. There are nine parishes, four abbeys, and several convents for both sexes. The citadel is very advantageously situated on high ground, and commands the whole city. Cambray is one of the most opulent and commercial cities in the Low Countries; and makes every year a great number of pieces of cambric, with which the inhabitants drive a great trade. E. Long. 3. 20. N. Lat. 50. 11.

CAMBRAY (M. de Fencelon, archbishop of). See FENELON.

CAMBRESIS, a province of France, in the Netherlands, about 25 miles in length. It is bounded on the north and east by Hainhalt, on the south by Picardy, and on the west by Artois. It is a very fertile and populous country; and the inhabitants are industrious, active, and ingenious. The trade consists principally in corn, sheep, very fine wool, and fine linen cloth. Cambray is the capital town.

CAMBRIA, a name for the principality of Wales. † See CAMBERY, and Waleis.

CAMBRIDGE, a town of England, and capital of the county of that name. It takes the name of Cambridge from the bridge over the Cam, which divides the town into two parts. Either it or a place

Cambridge. In the neighbourhood was styled *Camboritum*, in the time of the Romans. It suffered much during the wars with the Danes. Here was a castle built by William the conqueror, of which the gatehouse yet remains, and is now the county goal. By Doomsday-book it

appears, that it then had ten wards, containing 387 houses. In William Rufus's reign it was quite destroyed by Roger de Montgomery; but Henry I. bestowed many privileges upon it, particularly an exemption from the power of the sheriff, on condition of its paying yearly into the exchequer 100 merks (equivalent to 1000 pounds now), and from tolls, lassage, pontage, passage, and stallage, in all fairs of his dominions. There is a ditch still called the *king's ditch*, made by Henry III. during the barons wars, to secure it against the rebels in the Isle of Ely. In the rebellion of Wat Tyler and Jack Straw, in the reign of Richard II. the university records were burnt. The place now called the *Fenury* was formerly inhabited by Jews. The glory of Cambridge is its university; but when it had its beginning, is uncertain. At first there was no public provision for the accommodation or maintenance of the scholars; but afterwards inns began to be erected by pious persons for their reception, and in the time of Edward I. colleges began to be built and endowed.

The university enjoys great privileges; and is governed by the chancellor, who is always some nobleman, and may be changed every three years, and has a commissary under him; the high steward, chosen by the senate; the vice-chancellor, chosen by the whole body of the university, out of two named by the heads of the colleges; two proctors chosen every year; two taxers, who, with the proctors, regulate the weights and measures. The other officers are, a register, or keeper of the archives, three esquire-beadles, one yeoman-beadle, and a library-keeper. Each college has its schools and library, as at Oxford, of which those of Trinity and St John are the most considerable. King George I. purchased for 1000 l. the library of Dr Moor bishop of Ely, consisting of 30,000 volumes, and made a present of it to the university, which, out of gratitude, erected, in 1739, a fine marble statue of that prince in the senate-hall of king's-college. A professor of modern languages and history was also established here at Oxford, with a salary of 400 l. for himself and two to teach under him, by king George I. in 1724. In 1728, a professorship for natural philosophy was erected by Dr Woodward, a professor at Gresham college London, with a salary of 150 l. a-year. The same gentleman left them also his collection of fossils, and a part of his library. The master and fellows of Catherine-hall are trustees of an hospital for the cure of poor diseased people gratis; for the building and furnishing of which, Dr Addenbroke left 4000 l. Each college has its chapel for worship; but public sermons are preached at St Mary's church. The following are the most remarkable structures: 1. The chapel of king's-college, which for its contrivance and extent, fine carved work in wood and stone, and painted windows, is hardly to be equalled in the world. It is entirely of free stone, roof and all, without one pillar to support it. 2. Trinity-college and library, wonderful both for the design and execution. We must not omit to observe, that a fellowship was founded at Magdalen-college, called the *travelling Norfolk fellow-*

ship, because it is appropriated to gentlemen of that country. Any person that is qualified, may borrow whatever book he has occasion for from the libraries at Cambridge; and any one that is qualified may study in those of Oxford. The privilege of sending members to parliament was first granted to the university by James I. The town is governed by a mayor, high-steward, recorder, 13 aldermen, of whom the mayor is one, 24 common council men, a town clerk, and other inferior officers. The mayor, when he enters on his office, takes an oath to maintain the privileges of the university. The town has 14 parish-churches, and is pretty large; but the situation is low and dirty. E. Long. o. 7. N. Lat. 52. 15.

CAMBRIDGESHIRE, a county of England, bounded on the east by Norfolk, on the south by Essex and Hertfordshire, on the west by Bedfordshire and Huntingdonshire, and on the north by Lincolnshire. It is about 40 miles long, 25 broad, and 130 in circumference. It lies in the diocese of Ely; and sends six members to parliament, two for the county, two for the university, and two for the town of Cambridge. The air is very different in different parts of the county. In the fens it is moist and foggy, and therefore not so wholesome; but in the south and east parts it is very good, these being much drier than the other: but both, by late improvements, have been rendered very fruitful, the former by draining, and the latter by cinquefoil; so that it produces plenty of corn, especially barley, saffron, and hemp, and affords the richest pastures. The rivers abound with fish, and the fens with wild fowl. The principal manufactures of the county are malt, paper, and baskets. The chief rivers are the Ouse, which divides the county into two parts, and is navigable from Cambridge to Lynn in Norfolk; the Cam, which in the British signifies *crooked*, to denote its winding; the Welland, the Glenc, the Witham, and that called *Peterborough river*, which is navigable to that city from Wisbech. The fens called *Bedford level* consist of about 300,000 acres of marshy ground, lying in Cambridgeshire, Norfolk, Suffolk, Huntingdonshire, Northamptonshire, and Lincolnshire, and surrounded on all hands, except towards the sea, with high lands. As it appears to have been dry land formerly, the great change it has undergone must have been owing either to a violent breach and inundation of the sea, or to earthquakes. As the towns in and about the fens were great sufferers by the stagnation of the waters in summer, and want of provisions in winter, many attempts were made to drain them, but without success, until the time of Charles I. in which, and that of his son, the work was happily completed, and an act of parliament passed, by which a corporation was established for its preservation and government. By the same act, 83,000 acres were vested in the corporation, and 10,000 in the king. In these fens are a great many decoys, in which incredible numbers of ducks, and other wild fowl, are caught during the season.

New CAMBRIDGE, a town of New England about three miles from Boston, remarkable for an university consisting of three colleges. W. Long. 70. 4. N. Lat. 42. o.

CAMBYSES. See *(History of)* PERSIA.

CAMCHATKA. See KAMCHATKA.

CAMDEN (William), the great antiquarian, was born

Cambridge-shire
||
Camden.

Camden.

born in London in the year 1551. His father was a native of Litchfield in Staffordshire, who settling in London, became a member of the company of painters-stainers, and lived in the Old Bailey. His mother was of the ancient family of Curwen, of Wirkington in Cumberland. He was educated first at Christ's hospital, and afterwards at St Paul's school: from thence he was sent, in 1566, to Oxford, and entered servitor of Magdalen college; but being disappointed of a demy's place, he removed to Broad-gate hall, and somewhat more than two years after, to Christ-church, where he was supported by his kind friend and patron Dr Thornton. About this time he was a candidate for a fellowship of All-Souls college, but lost it by the intrigues of the Popish party. In 1570, he supplicated the regents of the university to be admitted bachelor of arts; but in this also he miscarried. The following year Mr Camden came to London, where he prosecuted his favourite study of antiquity, under the patronage of Dr Goodman, dean of Westminster, by whose interest he was made second master of Westminster school in 1575. From the time of his leaving the university to this period, he took several journeys to different parts of England, with a view to make observations and collect materials for his *Britannia*, in which he was now deeply engaged. In 1581 he became intimately acquainted with the learned president Briffon, who was then in England; and, in 1586, he published the first edition of his *Britannia*. In 1593, he succeeded to the head mastership of Westminster school on the resignation of Dr Grant. In 1597 he published his Greek grammar, and the same year was made Clarenceux king at arms. In the year 1600 Mr Camden made a tour to the north, as far as Carlisle, accompanied by his friend Mr (afterwards Sir Robert) Cotton. In 1606 began his correspondence with the celebrated president de Thou, which continued to the death of that faithful historian. In the following year he published his last edition of the *Britannia*, which is that from which the several English translations have been made; and in 1608, he began to digest his materials for a history of the reign of queen Elizabeth. In 1609, after recovering from a dangerous illness, he retired to Chislehurst in Kent, where he continued to spend the summer-months during the remainder of his life. The first part of his annals of the queen did not appear till the year 1615, and he determined that the second volume should not appear till after his death (A). The work was entirely finished in 1617; and from that time he was principally employed in collecting more materials for the further improvement of his *Britannia*. In 1622, being now upwards of 70, and finding his health decline apace, he determined to lose no time in executing his design of founding an history-lecture in the university of Oxford. His deed of gift was accordingly transmitted by his friend Mr Heather, to Mr Gregory Wheare, who was, by himself, appointed his first professor. He died at Chislehurst, in 1623, in the 73^d year of his age; and was buried with great solemnity

in Westminster-abbey in the south aisle, where a monument of white marble was erected to his memory. Camden was a man of singular modesty and integrity; profoundly learned in the history and antiquities of this kingdom, and a judicious and conscientious historian. He was revered and esteemed by the literati of all nations, and will be ever remembered as an honour to the age and country wherein he lived. Besides the works already mentioned, he was author of an excellent Greek grammar, and of several tracts in Hearne's collection.

CAMEL, in zoology. See CAMELUS.

CAMELFORD, a borough town of Cornwall in England, consisting of about 100 houses badly built; but the streets are broad and well paved. W. Long. 5. 4. N. Lat. 50. 40. It sends two members to parliament.

CAMELOPARDALIS, in zoology, the trivial name of a species of CERVUS.

CAMELUS, or CAMEL, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of the camel are these. It has no horns; it has six fore-teeth in the under jaw; the laniarii are wide set, three in the upper, and two in the lower jaw; and there is a fissure in the upper lip, resembling a cleft in the lip of a hare. The species are,

I. The DROMEDARIUS, or African camel, with one P.L.XXVIII. bunch or protuberance on the back. It has four callous fig. 2. protuberances on the fore-legs, and two on the hind ones. The hoof, or rather callous skin, of their feet, which is softer than the hoofs of other animals, enables the camel to walk along the sandy paths of warm climates with greater ease; as, by yielding to the pressure, it is not so subject to be injured by friction. The structure and constitution of these creatures is admirably adapted to the climate which produces them. In Africa and Arabia, where this animal is most frequent, and is employed in carrying all kinds of burdens, there is great scarcity of water. The camel has often been observed to travel longer than any other creature without drink. This it is enabled to do from a singular construction in its stomach. It is one of the ruminating animals, and has four stomachs. At the top of the second stomach there are several square holes, which are the orifices of about 20 cavities or sacks placed between the two membranes which compose the substance of this stomach. These sacks are so many reservoirs which they fill over and above what satisfies their present thirst, and serve for supplying them with water in long journeys thro' the dry and sandy deserts, where wells and rivers are seldom to be met with. Travellers, when much oppressed with drought, are sometimes obliged to kill their camels, in order to have a supply of drink from these reservoirs. By the above means camels are enabled to pass over unwatered tracts for seven or eight days, without requiring the least liquid; Leo Africanus says for 15. They can discover water by their scent at half a league's distance; and after a long abstinence will hasten towards it, long before their drivers perceive where it lies. Their patience

(A) The reign of queen Elizabeth was so recent when the first volume of the annals was published, that many of the persons concerned, or their dependents, were still living. It was no wonder, therefore, that the honest historian should offend those whose actions would not bear inquiry. Some of his enemies were clamorous and troublesome; which determined him not to publish the second volume during his life: but that posterity might be in no danger of disappointment, he deposited one copy in the Cotton library, and transmitted another to his friend Dupuy at Paris. It was first printed at Leyden in 1625.

Camelus.

tience under hunger is such, that they will travel many days, fed only with a few dates, or some small balls of bean or barley-meal, or on the miserable thorny plants they find in the desert. The camel carries very heavy burdens; and travels long, but with a slow pace. The largest kind will carry a load of 1000 or 1200 lb weight. They kneel down to be loaded, but rise the moment they find the burden equal to their strength: they will not permit an ounce more to be put on. They are most mild and gentle at all times but when they are in heat: during that period they are seized with a sort of madness, so that it is unsafe to approach them. They are not prevailed on to quicken their pace by blows; but go freely if gently treated, and seem enlivened by the pipe or any music. When fatigued, they lie on their breast.

PL. LXVIII.
fig. 3.

II. The BACTRIANUS, or Bactrian camel, has two bunches on the back, the hindmost of which is by much the largest. It is a native of Africa, and is more rarely to be met with than the dromedary. It is also much swifter in its motions. Camels have been the riches of Arabia from the time of Job to the present; the patriarch reckoned 6000 camels among his pastoral treasures, and the modern inhabitants of these countries estimate their wealth by the number of camels they possess: without them great part of Asia and Africa would be wretched; by them the sole commerce is carried on through arid and burning tracts, impassable but by beasts which Providence formed expressly for the burning deserts. They do not differ in their nature or manners from the other kind. In winter they are covered with very long hair, which falls off in the spring, and is carefully gathered, being wove into stuffs, and also cloths to cover tents. In summer their hair is short. Before the great heats, the owners smear their bodies to keep off the flies. The Arabs are very fond of the flesh of young camels. The milk of these animals is their principal subsistence; and the dung of camels is the fuel used by the caravans in the travels over the deserts. Camels have been introduced into Barbadoes and Jamaica; but for want of knowledge of their diet and treatment, have in general been of very little service.

There are varieties among the camels. The Turkman is the largest and strongest. The Arabian is hardy. What is called the *dromedary*, *mailbury*, and *raguahl*, is very swift. The common sort travel about 30 miles a-day. The last, which has a less bunch, and more delicate shape, and is also much inferior in size, never carries burdens, but is used to ride on. In Arabia they are trained for running matches; and in many places for carrying couriers, who can go above 100 miles a day on them, and that for nine days together, over burning deserts uninhabitable by any living creature. The Chinese call these swift camels expressively *song kyo to*, or camels with feet of the wind. The African camels are the most hardy, having more distant and more dreadful deserts to pass over than any of the others, from Numidia to the kingdom of Ethiopia.

III. The GLAMA, Llama, or South-American camel-sheep, has an almost even back, small head, fine black eyes, and very long neck, bending much, and very protuberant near the junction with the body: in a tame state, with smooth short hair; in a wild

state, with long coarse hair, white, grey, and russet, disposed in spots; with a black line from the head along the top of the back to the tail, and belly white. The spotted may possibly be the tame, the last the wild, llamas. The tail is short; the height from four to four feet and a half; the length from the neck to the tail, six feet. The carcase divested of skin and offals, according to the editor of Mr Barron's voyage, weighed 200 lb. In general, the shape exactly resembles a camel, only it wants the dorsal bunch. It is the camel of Peru and Chili; and, before the arrival of the Spaniards, was the only beast of burden known to the Indians. It is very mild, gentle, and tractable. We find, that, before the introduction of mules, they were used by the Indians to plough the land: that at present they serve to carry burdens of about 100 lb.: that they go with great gravity; and, like their Spanish masters, nothing can prevail upon them to change their pace. They lie down to the burden; and when wearied, no blows can provoke them to go on. Teuilee says, they are so capricious, that if struck, they instantly squat down, and nothing but caresses can make them arise. When angry, they have no other method of revenging their injuries than by spitting; and they can ejaculate their saliva to the distance of ten paces: if it falls on the skin, it raises an itching and a reddish spot. Their flesh is eaten, and is said to be as good as mutton. The wool has a strong disagreeable scent. They are very sure footed; therefore used to carry the Peruvian ores over the ruggedest hills and narrowest paths of the Andes. They inhabit that vast chain of mountains their whole length to the straits of Magellan; but except where these hills approach the sea, as in Patagonia, never appear on the coasts. Like the camel, they have powers of abstaining long from drink, sometimes for four or five days: like that animal, their food is coarse and trifling. — As every domestic animal has, or had its stock or origin in a wild state, we believe the llama and guanaco to be the same. The llama is described as the largest of the two domestic animals the Peruvians have; for, except that, they know no other than the congenerous pacos. We find two animals similar to these, wild; the larger, or guanaco, may be supposed to be a savage llama; the lesser, or vucuna, to be the pacos, in a state of nature: the brief descriptions we have left us of each, give us little room to doubt but that the difference of colour and hair arises only from culture. In a wild state, they keep in great herds in the highest and steepest parts of the hills; and while they are feeding, one keeps centry on the pinnacle of some rock: if it perceives the approach of any one, it neighs; the herd takes the alarm, and goes off with incredible speed. They outrun all dogs, so there is no other way of killing them but with the gun. They are killed for the sake of their flesh and hair; for the Indians weave the last into cloth. From the form of the parts of generation in both sexes, no animal copulates with such difficulty. It is often the labour of a day, *antequam autem ipsam veneremur incipiant, et absolvant*.

IV. The PACOS, or sheep of Chili, has no bunch on the back. It is covered with a fine valuable wool, which is of a rose red colour on the back of the animal, and white on the belly. They are of the same nature with the preceding; inhabit the same places, but are more capable of supporting the rigour of frost and snow: they live in

W. B. Smith del.

vast herds; are very timid, and exceedingly swift. The Indians take the pacos in a strange manner: they tie cords with bits of cloth or wool hanging to them, above three or four feet from the ground, cross the narrow passes of the mountains, then drive those animals towards them, which are so terrified by the flutter of the rags, as not to dare to pass, but, huddling together, give the hunters an opportunity to kill with their slings as many as they please. The tame ones will carry from 50 to 75 lb; but are kept principally for the sake of the wool and the flesh which is exceedingly well tasted.

CAMERA OBSCURA, a darkened room, or place into which a beam of light may be admitted through a small aperture; and wherein, by means of a proper apparatus, the images of external objects are exhibited distinctly in their natural colours; as is explained under the article DIOPTRICS.

CAMERARIA, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. Of this there are two species; the latifolia, and the angustifolia. The first is a native of the island of Cuba, and rises with a shrubby stalk to the height of 10 or 12 feet, dividing into several branches, garnished with roundish pointed leaves placed opposite. The flowers are produced at the end of the branches in loose clusters, which have long tubes enlarging gradually upward, and at the top are cut into five segments broad at their base, but ending in sharp points; the flower is of a yellowish white colour. The second sort has an irregular shrubby stalk, which rises about eight feet high, sending out many branches which are garnished with very narrow thin leaves placed opposite at each joint. The flowers are produced scatteringly at the end of the branches, which are shaped like those of the former sort, but smaller. It is a native of Jamaica. Both these plants abound with an acrid milky juice like the spurge. They are propagated by seeds, which must be procured from the places of their growth. They may also be propagated by cuttings planted in a hot-bed during the summer-months: they must have a bark-stove, for they are very tender plants; but in warm weather they must have plenty of air.

CAMERARIUS (Joachim), one of the most learned writers of his time, was born in 1500, at Bamberg, a city of Franconia; and obtained great reputation by his writings. He translated into Latin Herodotus, Demosthenes, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret, Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek epistles; Accounts of his journeys, in Latin verse; a Commentary on Plautus; the Lives of Helius Eobanus Hessus, and Philip Melancthon, &c. He died in 1574.

CAMERARIUS (Joachim), son of the former, and a learned physician, was born at Nuremberg in 1534. After having finished his studies in Germany, he went into Italy, where he obtained the esteem of the learned. At his return he was courted by several princes to live with them; but he was too much devoted to books, and the study of chemistry and botany, to comply. He wrote an horstus medicus, and several other works. He died in 1598.

CAMERATED, among builders, the same with vaulted or arched.

CAMERET-BAY, in the province of Brittany in

France, forms the harbour of Brest. See BREST.

CAMERINO, a town of the ecclesiastical state in Italy, situated in E. Long. 13. 7. N. Lat. 45. 5.

CAMERLINGO, according to Ducange, signified formerly the pope's or emperor's treasurer: at present, camerlingo is no where used but at Rome, where it denotes the cardinal who governs the ecclesiastical state and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal camerlingo publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and 12 prelates called *clerks of the chamber*.

CAMERON (John), one of the most famous divines among the Protestants of France in the 17th century, was born at Glasgow in Scotland, where he taught the Greek tongue; and having read lectures upon that language for about a year, travelled, and became professor at several universities, and minister at Bourdeaux. He published, 1. Theological lectures; 2. *Icon Johannis Cameronii*; and some miscellaneous pieces. He died in 1625, aged 60.

CAMERONIANS, a party of Presbyterians, which sprung up in Scotland in the reign of king Charles II. They affirmed that the king had forfeited his right to the crown, by breaking the solemn league and covenant, which were the terms on which he received it. They pretended both to dethrone and excommunicate him; and broke out into an open rebellion. Upon the revolution, they were reconciled to the kirk; and their preachers submitted to the general assembly of the church of Scotland, in 1690. That sect is now greatly declined. They are few in number, and split into many parties.

CAMERONIANS, or *Cameronites*, is also the denomination of a party of Calvinists in France, who asserted that the will of man is only determined by the practical judgment of the mind; that the cause of mens doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind. They had this name from John Cameron, a famous professor, first at Glasgow, where he was born, in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which last place he broached his new doctrine of grace and free-will, which was formed by Amyraut, Cappel, Bochart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. The Cameronians are a sort of mitigated Calvinists, and approach to the opinion of the Arminians. They are also called *Universalists*, as holding the universality of Christ's death; and sometimes *Amyraldists*. The rigid adherents to the synod of Dort accused them of Pelagianism, and even of Manicheism. The controversy between the parties was carried on with a zeal and subtilty scarce conceivable; yet all the question between them was only, Whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God impresses into the mind? The synod of Dort had defined that God not only illuminates the understanding, but gives motion to the will by making an internal change therein. Cameron only admitted the

Camillus
I
Cammin.

the illumination; whereby the mind is morally moved, and explained the ferment of the fynod of Dort so as to make the two opinions consistent.

CAMILLUS (Marcus Furius), was the first who rendered the family of *Furius* illustrious. He triumphed four times, was five times dictator, and was honoured with the title of the *second founder of Rome*. In a word, he acquired all the glory a man can gain in his own country. Lucius Apulcius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, instead of rejoicing at the devastation of Rome by the Gauls, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost strictness the sacred law of Rome, in refusing to accept the command which several private persons offered him. The Romans, who were besieged in the capitol, created him dictator in the year 363; in which office he acted with so much bravery and conduct, that he entirely drove the army of the Gauls out of the territories of the commonwealth. He died in the 81st year of his age, 365 years before the Christian æra.

CAMILLI, and **CAMILLE**, in Roman antiquity, a certain number of boys and girls, who assisted in the sacrifices to the gods, but more especially attended the flamen dialis.

CAMINHA, a maritime town of Portugal, in the province of Entre-Duero-e-Minho, with the title of a duchy. It is situated at the mouth of the river Minho, in W. Long. 9. 15. N. Lat. 41. 44.

CAMIS, or **KAMIS**, in the Japonic affairs, denote the deified souls of illustrious personages, believed to interest themselves in the welfare of their countrymen: in which sense they answer to the deified heroes of antiquity. See **HERO**.

CAMISADE, in the art of war, an attack by surprise in the night, or at the break of day, when the enemy is supposed to be a-bed. The word is said to have taken its rise from an attack of this kind; wherein, as a badge or signal to know one another by, they bore a shift, in French called *chemise*, or *camise*, over their arms.

CAMISARDS, a name given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms in their own defence, in 1688.

CAMLETINE, a slight stuff, made of hair and coarse silk, in the manner of camblet. It is now out of fashion.

CAMMA, and **GOMBI**, two provinces of the kingdom of Loango in Africa. The inhabitants are continually at war with each other. The weapons they formerly used in their wars were the short pike, bows and arrows, sword and dagger; but since the Europeans have become acquainted with that craft, they have supplied them with fire-arms. The chief town of Gombi lies about a day's journey from the sea. Their rivers abound with a variety of fish; but are infested with scorpions, which do great mischief both by land and water. The principal commerce with the natives is in logwood, elephants teeth, and tails, the hair of which is highly valued, and used for several curious purposes.

CAMMIN, a maritime town of Germany, in Brandenburg Pomerania, situated in E. Long. 15°. N. Lat. 54°.

Camoens.

CAMOENS (Louis de), a famous Portuguese poet, the honour of whose birth is claimed by different cities. But according to N. Antonio, and Manuel Correa his intimate friend, this event happened at Lisbon in 1517. His family was of considerable note, and originally Spanish. In 1370, Vasco Perez de Caamans, disgraced at the court of Castile, fled to that of Lisbon, where king Ferdinand immediately admitted him into his council, and gave him the lordships of Sardoal, Punete, Marano, Amendo, and other considerable lands; a certain proof of the eminence of his rank and abilities. In the war for the succession, which broke out on the death of Ferdinand, Camoens sided with the king of Castile, and was killed in the battle of Aljubarota. But though John I. the victor, seized a great part of his estate, his widow, the daughter of Gonsalo Tereyro, grand master of the order of Christ, and general of the Portuguese army, was not reduced beneath her rank. She had three sons who took the name of *Camoens*. The family of the eldest intermarried with the first nobility of Portugal; and even, according to Caistera, with the blood royal. But the family of the second brother, whose fortune was slender, had the superior honour to produce the author of the *Lusiad*.

Early in his life the misfortunes of the poet began. In his infancy, Simon Vaz de Camoens, his father, commander of a vessel, was shipwrecked at Goa, where, with his life, the greatest part of his fortune was lost. His mother, however, Anne de Macedo of Santarene, provided for the education of her son Louis at the university of Coimbra. What he acquired there, his works discover; an intimacy with the classics, equal to that of a Scaliger, but directed by the taste of a Milton or a Pope.

When he left the university, he appeared at court. He was handsome; had speaking eyes, it is said; and the finest complexion. Certain it is, however, he was a polished scholar, which, added to the natural ardour and gay vivacity of his disposition, rendered him an accomplished gentleman. Courts are the scenes of intrigue; and intrigue was fashionable at Lisbon. But the particulars of the amours of Camoens rest unknown. This only appears: he had aspired above his rank, for he was banished from the court; and in several of his sonnets he ascribes this misfortune to love.

He now retired to his mother's friends at Santarene. Here he renewed his studies, and began his poem on the discovery of India. John III. at this time prepared an armament against Africa. Camoens, tired of his inactive obscure life, went to Ceuta in this expedition, and greatly distinguished his valour in several encounters. In a naval engagement with the Moors in the straits of Gibraltar, in the conflict of boarding, he was among the foremost, and lost his right eye. Yet neither hurry of actual service nor the dissipation of the camp could flit his genius. He continued his *Lusitadar*, and several of his most beautiful sonnets were written in Africa, while, as he expressed it,

One hand the pen, and one the sword, employ'd.

The fame of his valour had now reached the court, and he obtained permission to return to Lisbon. But, while he solicited an establishment which he had merited in the ranks of battle, the malignity of evil tongues, as he calls it in one of his letters, was injuriously poured upon him. Though the bloom of his early youth

was

was effaced by several years residence under the scorching heavens of Africa, and though altered by the loss of an eye, his preference gave uneasiness to the gentlemen of some families of the first rank where he had formerly vilted. Jealousy is the characteristic of the Spanish and Portuguese; its resentment knows no bounds, and Camoens now found it prudent to banish himself from his native country. Accordingly, in 1553, he sailed for India, with a resolution never to return. As the ship left the Tagus, he exclaimed, in the words of the sepulchral monument of Scipio Africanus, *Ingrata patria, non possidebis ossa mea!* "Ungrateful country, thou shalt not possess my bones!" But he knew not what evils in the East would awake the remembrance of his native fields.

When Camoens arrived in India, an expedition was ready to sail to revenge the king of Cochín on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vafconcello in an expedition to the Red Sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined in the fleet or camp. He visited Mount Felix and the adjacent inhospitable regions of Afriq, which he so strongly pictures in the *Lusiad*, and in one of his little pieces where he laments the absence of his mistress.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his Epic Poem. But this serenity was interrupted, perhaps by his own imprudence. He wrote some satires which gave offence; and, by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his *Lusiad*; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulph near the mouth of the river Mehon on the coast of China. All he had acquired was lost in the waves: his poems, which he held in one hand, while he swam with the other, were all he found himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalised in the prophetic song in the tenth *Lusiad*; and in the seventh, he tells us, that here he lost the wealth which satisfied his wishes.

Agora da esperança ja adquirida, &c.

Now blest with all the wealth long hope could crave,
Soon I behold that wealth beneath the wave
For ever lost —
My life, like Judah's heaven-doom'd king of yore,
By miracle prolong'd —

On the banks of the Mehon, he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry

him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, whose characteristic was politeness, admitted him into intimate friendship, and Camoens was happy till count Redondo assumed the government. Those who had formerly procured the banishment of the satyrists, were silent while Constantine was in power. But now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifference with which he made his most horrible witticism on the Zamorim, he suffered the innocent man to be thrown into the common prison. After all the delay of bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors; and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such treatment among them. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allured the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Cabral, however, and Hector de Sylveira, paid the demand; and Camoens, says Faria, and the honour of Barreto, were sold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his *Lusiad*, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, king Sebastian, then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the reverse of that of Camoens, certain it is, that the author of the *Lusiad* was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according

Camomile,
Camp.

to some writers, saved his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. To the eye of a careful observer, the fate of Camoens throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degenerated spirit, which suffered Camoens to depend on his share of the alms begged in the streets by his old hoary servant, the same spirit which caused this, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: *Em fim accaberey à vida, e narrar todos que fuy efecuada a minha patria, &c.* "I am ending the course of my life, the world will witness how I have loved my country. I have returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1579, in his 62^d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour, nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, was he buried.

CAMOMILE, in botany. See ANTHEMIS.

CAMP, the ground on which an army pitch their tents. It is marked out by the quarter-master general, who appoints every regiment their ground.

The chief advantages to be minded in chusing a camp for an army, are, to have it near the water, in a country of forage, where the soldiers may find wood for dressing their victuals; that it have a free communication with garriſons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and inclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel about 500 yards distance; the horse and dragoons, on the wings, and the foot, in the centre: sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the *body of reserve*. The artillery and bread-waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval betwixt one battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees; for then the air is not only moist and hurtful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good,

Camp.

they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army; more especially if the bloody flux prevails, in which case the best method of preventing a general infection, is to leave the ground with the privies, foul straw, and other filth of the camp, behind. This must be frequently done, if consistent with the military operations: but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day a thick layer of earth thrown into them till the pits are near full; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may best carry off their effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious steams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, furrounded with an inclosure of the height of 10 hands-breadth. It made a square of 12 miles in compass about the tabernacle; and within this was another, called the *Levites camp*.

The Greeks had also their camps, fortified with gates and ditches. The Lacedæmonians made their camp of a round-figure, looking upon that as the most perfect and defensible of any form: we are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstance of the place required it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper part were the general's pavilion, or prætorium, and the tents of the chief officers; in the lower, those of inferior degree were placed. On one side of the prætorium stood the quæstorium, or apartment of the treasurer of the army; and near this the forum, both for a market-place, and the assembling of councils. On the other side of the prætorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the prefects of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinarii and ablecti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called *principia*, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse; next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly the foreign foot. They fortified their camp with a ditch and parapet, which they termed *fossa* and *vallum*; in the latter some distinguish two parts, *viz.* the *agger* or earth, and the *fudes* or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the

Camp
Campaign.

Camp-
stacc-
||
Campania.

the tents themselves formed of the same matter.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga: in the rear are the quarters of the spahis and other horsemen. The body of the camp is possessed by the stately tents or pavilions of the vizier or general, rais effendi or chancellor, kahija or steward, the tellard bashaw or lord treasurer, and kapiflar kahiafee or master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent *lailac*, the place where the courts of justice are held; it being the disposition of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Scenites did. The camp of the Affyne Emir, or king of the country about Tadmor, is described by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that though he had the advantage of a rising ground, he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

CAMP, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehouses and shops there, but also live in these camps with their whole families. The Europeans, however, are so far indulged, that at Siam, and almost every where else, they may live either in the cities or suburbs, as they shall judge most convenient.

CAMPAGNA. See CAMPANIA.

CAMPAIGN, in the art of war, denotes the space of time that an army keeps the field, or is encamped.—The beginning of every campaign is considerably more unhealthy than if the men were to remain in quarters. After the first fortnight or three weeks encampment, the sickness decreases daily; the most infirm being by that time in the hospitals, and the weather daily growing warmer. This healthy state continues throughout the summer, unless the men get wet clothes or wet beds; in which case, a greater or less degree of the dysentery will appear in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews; then, and not sooner, the dysentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frosts begin. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but, for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of a campaign, is attended with more sickness than the first two months encampment: so that it is better to take the field a

fortnight sooner, in order to return into winter-quarters so much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANACEÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. convolvulus, ipomæa, polemonium, campanula, roella, viola, &c. &c.

CAMPANELLA (Thomas), a famous Italian philosopher, born at Stilo in Calabria, in 1568. He distinguished himself by his early proficiency in learning; for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled *Atheismus triumphatus*. Being at length set at liberty, he went to Paris, where he was graciously received by Lewis XIII. and cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

CAMPANI (Matthew) of Spoleto, curate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, assisted by his brother and pupil Joseph. He died after 1678.

CAMPANIA, a town of Italy, in the kingdom of Naples, and in the farther principato, with a bishop's see. E. Long. 15. 30. N. Lat. 40. 40.

CAMPANIA, or *Campania, di Roma*, anciently Latium, a province of Italy, bounded on the west by the Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good, the air is unwholesome. It is subject to the Pope, and is about 60 miles in length on the Mediterranean sea.

It hath been generally thought that the air of this country hath something in it peculiarly noxious during the summer-time; but Mr Condamine is of opinion that it is not more unhealthy than any other marshy country. His account follows. "It was after the invasion of the Goths in the fifth and sixth centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but raise itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preserved pavement of the Pantheon and its portico is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet; and that it is not possible to suppose that the ancient Romans should have built a temple in a place so low as to be covered with the waters of the Tiber on the least inundation. It is evident, then, that the level of the bed of this river

* See Botany,
p. 1310.

Campania.

is raised several feet; which could have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not been subject to inundations: to these overflows of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Totila. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters, deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 13th century, that Pope Innocent III. wrote, that few people at Rome arrived to the age of forty years, and that nothing was more uncommon there than to see a person of sixty. A very short time after, the popes transferred the seat of their residence to Avignon: during the seventy-two years they remained there, Rome became a desert; the monasteries in it were converted into stables; and Gregory XI. on his return to Rome, in 1376, hardly counted there 30,000 inhabitants. At his death began the troubles of the great schism in the west, which continued for upwards of 50 years. Martin V. in whom this schism ended in the year 1429, and his first successors, were able to make but feeble efforts against so inveterate an evil. It was not till the beginning of the 16th century that Leo X. under whom Rome began to resume her wonted splendor, gave himself some trouble about re-establishing the salubrity of the air: but the city, being shortly after besieged twice successively by the emperor Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sixtus V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up the humid and marshy grounds, and covering the banks of the Tiber and other places reputed uninhabitable with superb edifices. Since that time a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relaxed at present from these ancient scruples: I have seen cardinals, in the months of July and August, go from Rome to lie at Frascati, Tivoli, Albano, &c. and return the next or the following days to the city, without any detriment to their health: I have myself tried all these experiments, without suffering the least inconvenience from them: we have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the

greater part of the country people dare not still venture to lie during that season of the year, nor even as much as sleep in a carriage, in any part of the territory comprehended under the name of the *Campagna of Rome*."

CAMPANIFORM, or CAMPANULATED, an appellation given to flowers resembling a bell.

CAMPANINI, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

CAMPANULA, or BELL-FLOWER; a genus of the monogynia order, belonging to the pentandria class of plants.

Species. Of this genus there are no fewer than 41 species enumerated by botanical writers; but the following are the most worthy of attention. 1. The pyramidalis hath thick tuberous roots filled with a milky juice; it sends out strong, smooth, upright stalks, which rise to the height of four feet, garnished with smooth oblong leaves a little indented at the edges. The flowers are produced from the side of the stalks, and are regularly set on for more than half their length, forming a sort of pyramid; these are large, open, and shaped like a bell. The most common colour of the flowers is blue, though some are white, but the former are most esteemed. 2. The decurrens, or peach-leaved bell-flower, is a native of the northern parts of Europe: of this there are some with white, and some with blue flowers, and some with double flowers of both colours. These last have of late been propagated in such abundance as to have almost banished from the gardens those with single flowers. 3. The medium, commonly called *Canterbury bell-flower*, is a biennial plant, which perishes soon after it has ripened its seeds. It grows naturally in the woods of Italy and Austria; but is cultivated in the British gardens for the beauty of its flowers, which are blue, purple, white, and striped, with double flowers of all the colours. This species hath oblong, rough, hairy leaves, serrated on their edges: from the centre of these rises a stiff, hairy, furrowed stalk, about two feet high, sending out several lateral branches, garnished with long, narrow, hairy leaves sawed on their edges. From the setting on of these leaves proceed the foot-stalks of the flower; those which are on the lower part of the stalk and branches diminishing gradually in their length upward, and thereby forming a sort of pyramid. The flowers of this kind are very large, so make a fine appearance. The seeds ripen in September, and the plants decay soon after. 4. The trachelium, with nettle leaves, hath a perennial root, which sends up several stiff hairy stalks having two ribs or angles. These put out a few short side-branches, garnished with oblong hairy leaves deeply sawed on their edges. Toward the upper part of the stalks, the flowers come out alternately upon short trifid foot-stalks having hairy empalements. The colours of the flowers are a deep and a pale blue and white, with double flowers of the same; the double-flowered kind only merit a place in gardens. 5. The latifolia, or greatest bell-flower, hath a perennial root, composed of many fleshy fibres that abound with a milky juice. From these arise several strong, round, single stalks, which never put out branches, but are garnished with oval spear-shaped leaves slightly indented on their edges. Towards the upper part of the stalk the flowers come out singly upon short foot-stalks; their colours are blue, purple, and white. 6. The

Campaniform
|| Campanula.

rapun-

rapunculus, or rampion, hath roundish fleshy roots, which are eatable, and much cultivated in France for fallads; some years past it was cultivated in the English gardens for the same purpose, but is now generally neglected. It is a native of Britain; but the roots of the wild fort never grow to half the size of those which are cultivated. 7. The speculum, with yellow eye-bright leaves, is an annual plant with slender stalks rising a foot high, branching out on every side, and garnished with oblong leaves a little curled on their edges; from the wings of the leaves come out the flowers sitting close to the stalks, which are of a beautiful purple inclining to a violet colour. In the evening, they contract and fold into a pentagonal figure; from whence it is by some called *viola pentagonia*, or *five-cornered violet*. 8. The hybrida, or common Venus looking-glass. This seldom rises more than six inches high, with a stalk branching from the bottom upward, and garnished with oval leaves sitting close to the stalks, from the base of which the branches are produced, which are terminated by flowers very like the former fort. This was formerly cultivated in the gardens; but since the former kind hath been introduced, it hath almost supplanted this; for the other is a much taller plant, and the flowers larger, though of a less beautiful colour. 9. The canariensis, with an orach leaf and tuberous root, is a native of the Canary islands. It hath a thick fleshy root of an irregular form; sometimes running downward like a parsnep, at other times dividing into several knobs near the top; and when any part of the root is broken, there issues out a milky juice at the wound. From the head or crown of the root arise one, two, three, or more stalks, in proportion to the size of the root; but that in the centre is generally larger, and rises higher, than the others. These stalks are very tender, round, and of a pale green; their joints are far distant from each other; and when the roots are strong, the stalks will rise to ten feet high, sending out several lateral branches. At each joint they are garnished with two, three, or four spear-shaped leaves, with a sharp pointed beard on each side. They are of a sea-green; and, when they first come out, are covered slightly with an ash-coloured pounce. From the joints of the stalk the flowers are produced, which are of the perfect bell-shape, and hang downward; they are of a flame-colour, marked with stripes of a brownish red: the flower is divided into five parts; at the bottom of each is seated a nectarium, covered with a white transparent skin, much resembling those of the crown imperial, but smaller. The flowers begin to open in the beginning of October, and there is often a succession of them till March. The stalks decay to the root in June, and new ones spring up in August.

Culture, &c. The first fort is cultivated to adorn halls, and to place before chimnies in the summer when it is in flower, for which purpose there is no plant more proper; for when the roots are strong, they will send out four or five stalks which will rise as many feet high, and are adorned with flowers a great part of their length. When the flowers begin to open, the pots are removed into the rooms, where, being shaded from the sun and rain, the flowers will continue long in beauty; and if the pots are every night removed into a more airy situation, but not exposed to heavy rains, the flowers will be fairer, and continue much longer in

beauty. Those plants which are thus treated, are seldom fit for the purpose the following season; therefore a supply of young ones must be annually raised. The plant may be propagated either by dividing the roots or by seeds, but the latter produce the most vigorous and best flowering plants. The seeds must be sown in autumn in boxes or pots filled with light undunged earth, and placed in the open air till the frost or hard rains come on: then they must be placed under a hot-bed frame, where they may be sheltered from both; but in mild weather, the glass should be drawn off every day, that they may enjoy the free air: with this management the plants will come up early in the spring, and then they must be removed out of the frame, placing them first in a warm situation; but, when the season becomes warm, they should be so placed as to have the morning sun only. In September the leaves of the plants will begin to decay, at which time they should be transplanted; therefore there must be one or two beds prepared, in proportion to the number of plants. These beds must be in a warm situation, and the earth light, sandy, and without any mixture of dung. The plants must then be taken out of the pots or cases very carefully, so as not to bruise their roots; for they are very tender, and on being broken the milky juice will flow out plentifully, which will greatly weaken them. These should be planted at about six inches distance each way, with the head or crown of the root half an inch below the surface. If the season proves dry, they must be gently watered three or four days after they are planted; the beds should also be covered with mats in the day time, but which should be taken off at night to let the dew fall on the plants. Towards the end of November the beds should be covered over with some old tanners bark to keep out the frost; and where there is not convenience for covering them with frames, they should be arched over with hoops, that in severe weather they may be covered with mats. In the spring the mats must be removed, and, the following summer, the plants kept free from weeds. In autumn the earth should be stirred between them, some Irish earth spread over the beds, and the plants covered in winter as before. In these beds the plants may remain two years, during which time they are to be treated in the manner before directed. The roots will now be strong enough to flower; so, in September they should be carefully taken up, and some of the most promising carefully planted in pots; the others may be planted in warm borders, or in a fresh bed, at a greater distance than before, to allow them room to grow. Those plants which are potted should be sheltered in winter from great rains and hard frosts, otherwise they will be in danger of rotting, or at least will be so weakened as not to flower with any strength the following summer; and those which are planted in the full ground, should have some old tanners bark laid round them to prevent the frost from getting at the roots. The second, third, fourth, and fifth forts are so easily propagated by parting the roots, or by seeds, that no particular directions for their culture need be given. The sixth fort, which is cultivated for its esculent roots, may be propagated by seeds, which are to be sown in a shady border; and when the plants are about an inch high, the ground should be hoed as is practised for onions, to cut up the weeds, and thin the

plants,

Campbell.
Campbell.

plants, to the distance of three or four inches; and when the weeds come up again they must be hoed over to destroy them: this, if well performed in dry weather, will make the ground clean for a long time; so that, being three times repeated, it will keep the plants clean till winter, which is the season for eating the roots, when they may be taken up for use as wanted. They will continue good till April, at which time they fend out their stalks, when the roots become hard and unfit for use.—The seventh and eighth sorts are easily propagated by seeds, which they produce in plenty. If these, and the Venus navelwort, dwarf lychnis, candy-tuft, and other low annual flowers, are properly mixed in the border of the flower-garden, and sown at two or three different seasons, so as to have a succession of them in flower, they will make an agreeable variety. If these seeds are sown in autumn, the plants will flower early in the spring; but if sown in the spring, they will not flower till the middle of June; and if a third sowing is performed about the middle of May, the plants will flower in August; but from these, good seeds must not be expected.—The ninth sort is propagated by parting the roots, which must be done with caution: for if they are broken or wounded, the milky juice will flow out plentifully; and if planted before the wounds are skinned over, it occasions their rotting: therefore when any of them are broken, they should be laid in the green-house a few days to heal. These roots must not be too often parted, if they are expected to flower well; for by this means they are weakened. The best time for transplanting and parting their roots is in July, soon after the stalks are decayed. They must not be planted in rich earth, otherwise they will be very luxuriant in branches, and have but few flowers. They succeed best in a light sandy loam, mixed with a fourth part of screened lime-rubbish: when the roots are first planted the pots should be placed in the shade, and unless the season is very dry they should not be watered; for during the time they are inactive, wet is very injurious to them. About the middle of August, the roots will begin to put out fibres; at which time, if the pots are placed under a hot-bed frame, and as the nights grow cool, covered with the glasses, but opened every day to enjoy the free air, it will greatly forward them for flowering, and increase their strength: when the stalks appear, they must be now and then refreshed with water; but it must not be given too often, nor in too great quantity. The plants thus managed, by the middle of September will have grown so tall as not to be kept any longer under the glass frame; they must, therefore, be removed into a dry airy glass-case, where they may enjoy the free air in mild weather, but screened from the cold. During the winter season they must be frequently refreshed with water, and guarded from frost; and, in the spring, when the stalks begin to decay, the pots should be set abroad in the shade, and not watered.

CAMPBELL (Archibald), earl and marquis of Argyle, was the son of Archibald earl of Argyle, by the lady Anne Douglas, daughter of William earl of Morton. He was born in the year 1598; and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the reformation.

During the commonwealth he was induced to submit to its authority. Upon the restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court, letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expressions of the most cordial attachment to the established government. But, besides the general indignation excited by Albemarle's discovery of this private correspondence; men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

CAMPBELL (Archibald), earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty, and his attachment to the royal family. Tho' his father was head of the covenanters, he himself refused to concur in any of their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his services, he made himself acceptable to Charles when that prince was in Scotland; and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under Middleton he obstinately persevered to harass and infect the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after fallen upon to commit him to prison; and his confinement was rigorously continued till the restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant renounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as propounded by the courtiers; but the country party propounded also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the

Campbell.

Campbell.

the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle; who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy councillor, he subjoined, in the duke's presence, an explanation which he had beforehand communicated to that prince, and which he believed to have been approved by him. It was in these words. "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my litation, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty: and this I understand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council: and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surpris'd a few days after, to find that a warrant was issued for committing him to prison; that he was indicted for high treason, leasing-making, and perjury; and that from the innocent words above-mentioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preserved to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his escape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert him-

Campbell.

self in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30, 1685. He shewed great constancy and courage under his misfortunes: on the day of his death he ate his dinner very cheerfully; and, according to his custom, slept after it a quarter of an hour or more, very soundly. At the place of execution he made a short, grave, and religious speech; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

CAMPBELL (John), duke of Argyle and Greenwich, grandson of the former, was born on the 10th of October, 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high, without receiving any hurt. At the age of 15, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to king William, who in the year 1694 gave him the command of a regiment. In this situation he remained till the death of his father, in 1703; when becoming duke of Argyle, he was soon after sworn of queen Anne's privy-council, made captain of the Scotch horseguards, and appointed one of the extraordinary lords of session. In 1704, her majesty reviving the Scottish order of the thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of *baron of Chatham* and *earl of Greenwich*, and in 1710 was made knight of the garter. His grace first distinguished himself in his military capacity at the battle of Oudenard; where he commanded as brigadier-general, with all the bravery of youth, and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence. In this sharp engagement, several musket-balls passed through the duke's cloaths, hat, and peruke. Soon after this hot action, he was sent to take the command in Spain; and after the reduction of Port Mahon, he returned to England. His grace having now a seat in the house of lords, he censured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander in chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stewarts and all its adherents. The consequence was, that both sets of Campbells, from family affection,

tion,

Campbell. tion, refused to strike a stroke, and retired out of the battle. He arrived at London March 6th 1716, and was in high favour; but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and from this period, to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that, the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder, on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster-abbey, executed by the ingenious Rouilliac.

The duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witness that application said to be made to him by one of the adherents of the Stewart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witness his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other respects he was the most able general of his time. The duke of Argyle, on all occasions, spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

Argyle the state's whole thunder born to wield,
And shake alike the senate and the field.

CAMPBELL (Dr John), a late writer, who distinguished himself by many esteemed literary productions; particularly as the author of a considerable part of *The ancient and modern universal history*, and of the *Biographia Britannica*. He wrote also *The present state of Europe*; *The lives of the English admirals*; and an ingenious whimsical tract on the means of attaining extraordinary longevity, entitled *Hermippus redeivous*. The public are likewise indebted to him for a much improved edition of *Harri's collection of voyages*. But his principal and favourite work was, *A political survey of Great Britain*, 2 vols 4to, published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. He was, during the latter part of his life, agent for the province

of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age.

CAMPBELLTOWN, a parliament town of Argyleshire in Scotland, seated on the lough of Kilkerran, on the eastern shore of Kintyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, having risen from a petty fishing town to its present flourishing situation in less than 30 years. About the year 1744, it had only two or three small vessels belonging to the port; but in 1772, there were 78 sail from 20 to 80 tons burthen, all built for, and employed in, the herring-fishery; and about 800 sailors were employed to man them. The inhabitants are reckoned to be upwards of 7000 in number. W. Long. 5. 10. N. Lat. 54.

CAMPDEN, a poor town of Gloucestershire in England, containing about 200 houses. It gives title to a viscount, and sends two members to parliament. W. Long. 1. 50. N. Lat. 52.

CAMPEACHY, a town of Mexico in South America, seated on the east coast of a bay of the same name, on the west of the province of Yucator. It is defended by a good wall and strong forts; but is neither so rich, nor carries on such a trade, as formerly; it having been the port for the sale of logwood, the place where it is cut being about 30 miles distant. It was taken by the English in 1596; by the bucaners in 1678; and by the Filibusters of St Domingo in 1685, who set it on fire, and blew up the citadel. W. Long. 93. 7. N. Lat. 19. 20.

CAMPEACHY-Wood, in botany. See HEMATOXYLUM.

CAMPEN, a strong town of Overysel in the United Provinces. It hath a citadel and a harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672; but they abandoned it the following year. It is seated near the mouth of the river Yssel and Zuider See. E. Long. 5. 35. N. Lat. 52. 38.

CAMPHORA, or CAMPHIRE, a solid concrete juice extracted from the wood of the laurus camphora*.

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a sense of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, malignant and epidemical distempers. In deliria, also, where opiates could not procure sleep, but rather aggravated the symptoms, this medicine has often been observed to procure it. All these effects, however, Dr Cullen attributes to its sedative property, and denies that camphire has any other medicinal virtues than those of an antispasmodic and sedative. He allows it to be very powerful, and capable of doing much good or much harm. From experiments made on different brute creatures, camphire appears to be poisonous to every one of them. In some it produced sleep followed by death, without any other symptom. In others, before death, they were awakened into convulsions and rage. It seems, too, to act chiefly on the stomach; for an entire piece swallowed, produced the abovementioned effects with very little diminution of weight.

Campion, er, author of an admired treatise on the art, flourished in the 12th century.

CAMPION (Edmund), an English Jesuit, was born at London, of indigent parents, in the year 1540; and educated at Christ's hospital, where he had the honour to speak an oration before queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St Mary's church. In 1568, he was junior professor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned papist; but being found rather too assiduous in persuading others to follow his example, he was committed to prison. He soon, however, found means to make his escape. He landed in England in 1571; and thence proceeded to Doway in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1573, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called *Neciar et ambrosia*, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1580, he was sent by Pope Gregory XIII. with the celebrated Father Parsons, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that 80 of these foreign seminaries, besides several others who by God's grace had been converted in England, were actually engaged in the pious work with great success; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming constancy and resolution: but seeing at last that the labour was abundant, and the labourers few, they solicited the assistance of the Jesuits; requesting, that, though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived, in an evil hour for Campian, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Walsingham the secretary of state, being informed of his uncommon assiduity in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Elliot, a noted priest-taker, who found him in the house of Edward Yates, Esq; at Lyford in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written *Campion the Jesuit*. He was imprisoned in the Tower; where, Wood says, "he did undergo many examinations, abuses, wrackings, tortures;" *exquisitisque cruciatibus tortus*, says Pitts. It is hoped, for the credit of our reformers, this torturing part of the story is not true. The poor wretch, how-

ever, was condemned, on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. Howsoever criminal in the eye of the law, or of the English gospel, might be the zeal of this Jesuit for the salvation of the poor heretics of this kingdom, biographers of each persuasion unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestant or Popish, say, that he was a man of most admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher whether in English or the Latin tongue, of a sweet disposition, and a well-polished man." Fuller, in his church-history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1570; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also *Chronologia universalis*, a very learned work; and various other tracts.

CAMPION, in botany, the English name of the LYCHNIS.

CAMPION, a town of the kingdom of Tanguth in Tartary. It was formerly remarkable for being a place through which the caravans passed in the road from Bukharia to China. E. Long. 104.53. N. Lat. 40.25.

CAMPISTRON, a celebrated French dramatic author, was born in 1656. Racine directed his poetical talents to the theatre, and assisted him in his first pieces. He died in 1723.

CAMPLI, or CAMPOLI, a town of Italy, in the kingdom of Naples, and in the farther Abruzzo, situated in E. Long. 13.55. N. Lat. 42.38.

CAMPO MAJOR, a town of the province of Alentejo in Portugal. W. Long. 7.24. N. Lat. 38.50.

CAMPREDON, a town of Catalonia in Spain, seated at the foot of the Pyrenean mountains. The fortifications were demolished by the French in 1691. W. Long. 1.56. N. Lat. 42.20.

CAMPS (Francis de), abbot of Notre Dame at Sigi, was born at Amiens in 1643; and distinguished himself by his knowledge of medals, by writing an history of France, and several other works. He died at Paris in 1723.

CAMPUS, in antiquity, a field or vacant plain in a city, not built upon, left vacant on account of wars, combats, exercises, or other uses of the citizens.

CAMPUS Maii, in ancient customs, an anniversary assembly of our ancestors held on May-day, when they confederated together for defence of the kingdom against all its enemies.

CAMPUS Martius, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber, thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots or single horses; here also stood the villa publica, or palace for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

Campion
||
Campus.

CAMPUS *Sceleratus*, a place without the walls of ancient Rome, where the Vestals who had violated their vows of virginity were buried alive.

CAMUL, a town of Asia, on the eastern extremity of the kingdom of Cialus, on the frontiers of Tangut. E. Long. 98. 5. N. Lat. 37. 15.

CAMUS, a person with a low flat nose, hollowed in the middle.

The Tartars are great admirers of camus beauties. Rubruquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

CAMUS (John Peter), a French prelate born in 1582. He was author of a number of pious romances (the taste of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable: *Arts non tam regendi, quam fallendi, homines; "the art not so much of governing, as of deceiving, mankind."* He died in 1652.

CAN, in the sea-language, as can-pump, a vessel wherewith seamen pour water into the pump to make it go.

CAN-Buoy. See BUOY.

CAN-Hook, an instrument used to sling a cask by the ends of the staves: it is formed by fixing a broad and flat hook at each end of a short rope; and the tackle by which the cask so slung may be hoisted or lowered, is hooked to the middle of the rope.

CANADA, or the province of Quebec, an extensive country of North America, bounded on the north-east by the gulph of St Lawrence, and St John's river; on the south-west, by lands inhabited by the savage Indians, which are frequently included in this province; on the south, by the provinces of Nova Scotia, New England, and New York; and on the north-west, by other Indian nations. Under the name of *Canada*, the French comprehended a very large territory; taking into their claim part of New Scotland, New England, and New York on the east; and extending it on the west as far as the Pacific Ocean. That part, however, which was reduced by the British arms in the last war, lies between 61 and 81 degrees of west longitude, and between 45 and 52 of north latitude. The climate is not very different from that of the northern British colonies; but as it is much further from the sea, and more to the northward, than most of those provinces, it has a much severer winter, though the air is generally clear; and, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceeding pleasant. The soil in general is very good, and in many parts extremely fertile; producing many different sorts of grains, fruits, and vegetables. The meadow grounds, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. The uncultivated parts are a continued wood, composed of prodigiously large and lofty trees, of which there is such a variety of species, that even of those who have taken most pains to know them, there is not perhaps one that can tell half the number. Canada produces, among others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and female maple; three sorts of ash-trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast

numbers of beech-trees and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which made out of one piece will contain 20 persons; others are made of the bark; the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; the ribs of these canoes are made of boughs of trees. In the hollow elms, the bears and wild cats take up their lodging from November to April. The country produces also a vast variety of other vegetables, particularly tobacco, which thrives well. Near Quebec is a fine lead mine, and many excellent ones of iron have been discovered. It hath also been reported that silver is found in some of the mountains. The rivers are extremely numerous, and many of them very large and deep. The principal are, the Ouattauais, St John's, Seguinay, Despaires, and Trois Rivieres; but all these are swallowed up by the great river St Lawrence. This river issues from the lake Ontario; and, taking its course north-east, washes Montreal, where it receives the Ouattauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes so broad and so deep, that ships of the line contributed in the last war to reduce that city. After receiving in its progress innumerable streams, it at last falls into the ocean at cape Rosiers, where it is 90 miles broad, and where the cold is intense and the sea boisterous. This river is the only one upon which any settlements of note are as yet formed; but it is very probable, that, in time to come, Canada, and those vast regions to the west, may be enabled of themselves to carry on a considerable trade upon the great lakes of fresh water which these countries environ. Here are five lakes, the least of which is of greater extent than the fresh-water lakes to be found in any other part of the world: these are the lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Michigan, though like lake Erie it is rather long, and comparatively narrow. But the lake Superior is larger than any of these, being not less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a most stupenduous fall or cataract, called the *falls of Niagara* *. The river St Lawrence, as already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at the several straits by which the lakes communicate with one another, and on that where the last of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preserved an influence over all the Indian nations that lie near them.

The most curious and interesting part of the natural history of Canada is the animals there produced. These are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, large squirrels of a greyish hue, hares and rabbits. The southern parts, in particular, breed great

Canada.

Canada.

great numbers of wild bulls, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and pools, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article than even the fur-trade.—There are in Canada a multitude of different Indian tribes: but these are observed to decrease in number where the Europeans are most numerous; owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. Their manners and way of living we have already particularly described †. The principal towns are Quebec, Trois Rivières, and Montreal. The commodities required by the Canadians from Europe are, Wine, or rather rum; cloths, chiefly coarse; linen; and wrought iron. The Indian trade requires rum, tobacco, a sort of duff blankets, gums, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds. While the country was in possession of the French, the Indians supplied them with poultry; and the French had traders, who, like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion many solemnities were observed, guards were placed, and the governor assisted to preserve order in so great and various a concourse of savage nations. But sometimes great disorders and tumults happened; and the Indians frequently gave for a dram all that they were possessed of. It is remarkable, that many of these nations actually passed by the English settlement of Albany in New York, and travelled 200 miles further to Montreal, though they could have purchased the goods they wanted cheaper at the former.

Since Britain became possessed of Canada, our trade with that country has generally employed 34 ships and 400 seamen; their exports, at an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amount to 150,000*l*. Their imports from Great Britain are computed at nearly the same sum. It will, however, be always impossible to overcome certain inconveniencies arising from the violence of the winter. This is so excessive from December to April, that the broadest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St Lawrence below Montreal, which prevent ships from penetrating to that emporium of inland commerce. Our communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter-season, until roads are formed that can be travelled without danger from the Indians. For these savage people often commit hostilities against us, without any previous notice; and frequently, without

any provocation, they commit the most horrid ravages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian Cabot, the famous Italian adventurer, who failed under a commission from Henry VII. But though the English monarch did not think proper to make any use of this discovery, the French quickly attempted it; we have an account of their fishing for cod on the banks of Newfoundland, and along the sea-coast of Canada, in the beginning of the 16th century. About the year 1506, one Denys, a Frenchman, drew a map of the gulph of St Lawrence; and two years after, one Aubert, a ship-master of Dieppe, carried over to France some of the natives of Canada. As the new country, however, did not promise the same amazing quantities of gold and silver produced by Mexico and Peru, the French, for some years, neglected the discovery. At last, in the year 1523, Francis I. a sensible and enterprising prince, sent four ships, under the command of Verazani, a Florentine, to prosecute discoveries in that country. The particulars of this man's first expedition are not known. All we can learn is, that he returned to France, and next year he undertook a second. As he approached the coast, he met with a violent storm; however, he came so near as to perceive the natives on the shore, making friendly signs to him to land. This being found impracticable by reason of the surf upon the coast, one of the sailors threw himself into the sea; but, endeavouring to swim back to the ship, a surge threw him on shore without signs of life. He was, however, treated by the natives with such care and humanity, that he recovered his strength, and was allowed to swim back to the ship, which immediately returned to France. This is all we know of Verazani's second expedition. He undertook a third, but was no more heard of, and it is thought that he and all his company perished before he could form any colony. In 1534, one Jacques Cartier of St Maloes set sail under a commission from the French king, and on the 10th of May arrived at Cape Bonavista in Newfoundland. He had with him two small ships besides the one in which he sailed. He cruised along the coasts of that island, on which he discovered inhabitants, probably the Eskimaux. He landed in several places along the coast of the Gulf, and took possession of the country in the king's name. On his return, he was again sent out with a commission, and a pretty large force: he returned in 1535, and passed the winter at St Croix; but the season proved so severe, that he and his companions must have died of the scurvy, had they not, by the advice of the natives, made use of the decoction of the tops and bark of the white pines. As Cartier, however, could produce neither gold nor silver, all that he could say about the utility of the settlement was disregarded; and in 1540, he was obliged to become pilot to one M. Roberval, who was by the French king appointed viceroy of Canada, and who sailed from France with five vessels. Arriving at the gulph of St Lawrence, they built a fort; and Cartier was left to command the garrison in it, while Roberval returned to France for additional recruits to his new settlement. At last, having embarked in 1549, with a great number of adventurers, neither he nor any of his followers were heard of more.

This fatal accident so greatly discouraged the court

† See America, no 29
—41.

of France, that, for 50 years, no measures were taken for supplying with necessaries the settlers that were left. At last, Henry IV. appointed the Marquis de la Roche lieutenant-general of Canada and the neighbouring countries. In 1598 he landed on the isle of Sable, which he absurdly thought to be a proper place for a settlement, though it was without any port, and without product except briars. Here he left about 40 malefactors, the refuse of the French jails. After cruising for some time on the coast of Nova Scotia, without being able to relieve these poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep lasted they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skins; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called *Pontgrave*, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many specimens of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with powers to extend his discoveries up the river St Lawrence. He failed in 1603, having in his company Samuel Champlain, who had been a captain in the navy, and was a man of parts and spirit. It was not, however, till the year 1608, that the colony was fully established. This was accomplished by founding the city of Quebec, which from that time commenced the capital of all the settlements in Canada. The colony, however, for many years continued in a low way, and was often in danger of being totally exterminated by the Indians. As the particulars of these wars, however, could neither be entertaining, nor indeed intelligible, to many of our readers, we choose to omit them, and in general observe, that the French not only concluded a permanent peace with the Indians, but so much ingratiated themselves with them, that they could with the greatest ease prevail upon them at any time to murder and scalp the English in their settlements. These practices had a considerable share in bringing about the last war with France, when the whole country was conquered by the British in 1761. The most remarkable transaction in this conquest was the siege of QUEBEC; for a particular account of which, see that article.

CANAL of COMMUNICATION, an artificial cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication between one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connection with rivers; the ease or difficulty with which a

proper quantity of water can be obtained; these and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expence of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed by floods: but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or shoals in rivers by a very simple operation. Two posts or pillars of mason-work, with grooves, are fixed, one on each bank of the river, at some distance below the shoal. The boat having passed these posts, planks are let down across the river by pulleys into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Flemings at this day, sometimes when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, along which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinese, who are said to be entirely ignorant of the nature and utility of locks. These rolling-bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

A Lock is a basin placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the basin being filled with water by an upper sluice to the level of the waters above, a vessel may ascend thro' the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened. But as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 13 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having 8½ feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 feet 8 inches fall. The side-walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: they should likewise slope outwards, in order to resist the pressure of the earth from behind.

Plate LXIX. fig. 1. A perspective view of part of a canal: the vessel L, within the lock A C.—Fig. 2. Section of an open lock: the vessel L about to enter.—Fig. 3. Canal. rior canal.

Canal.

X and Y (fig. 1.) are the two flood-gates, each of which consists of two leaves, resting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges. In order to make them open and shut with ease, each leaf is furnished with a long lever A b, A b; C b, C b. They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage G H (fig. 2, 3, & 4) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D, into the lock, where it is stoppt and retained by the gate C when shut, till the water in the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage G H must be shut by letting down the sluice G, the gate A must be also shut, and the passage K F opened by raising the sluice K; a free passage being thus given to the water, it descends through K F, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 2.

Now, let it be required to raise the vessel L (fig. 2) from the inferior canal B, to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened, so that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C b, which is easily performed, the water on each side of the gate being in equilibrio; the vessel then sails in to the lock. After this the gate C and the sluice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 3. The gate A is then opened, and the vessel passes into the canal D.

Again, let it be required to make a vessel descend from the canal D, into the inferior canal B. If the lock is empty, as in fig. 2. the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass thro' into the lock. Shut the gate A and the sluice G; then open the sluice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind wherever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the most early accounts of society we read of attempts to cut through large isthmuses, in order to make a communi-

cation by water, either betwixt different nations, or distant parts of the same nation, where land-carriage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to cut the isthmus which joins that peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several kings of Egypt attempted to join the Red-Sea to the Mediterranean. Cleopatra was exceedingly fond of this project. Soliman II. emperor of the Turks, employed 50,000 men in this great work. This canal was completed under the caliphate of Omar, but was afterwards allowed to fall into disrepair; so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the Isthmus of Corinth, which joins the Morea and Achaia, in order to make a navigable passage by the Ionian sea into the Archipelago. Demetrius, Julius Cæsar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were entirely ignorant of the use of water-locks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlemagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black Sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Maine, and this last falls into the Rhine near Mayence: for this purpose he employed a prodigious number of workmen; but he met with so many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: that of Briare was begun under Henry IV. and finished under the direction of cardinal Richelieu in the reign of Lewis XIII. This canal makes a communication betwixt the Loire and the Seine by the river Loing. It extends 11 French great leagues from Briare to Montargis. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are 42 locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Lewis XV. and is furnished with 20 locks. It goes by the name of the *canal of Orleans*; but it begins at the village of Combleux, which is a short French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Languedoc. It was proposed in the reigns of Francis I. and Henry IV. and was undertaken and finished under Lewis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it cuts thro' solid rocks for 1000 paces. At one end it joins the river Garonne near Tholouse, and terminates at the other in the lake Tau, which extends to the port of Cette. It was planned by Francis Riquet in the 1666, and finished

ed before his death, which happened in the 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Ostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Peking, extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holland, Russia, Germany, &c. We shall therefore confine ourselves to those that are either already finished, or at present executing, in our own country.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Nyne, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Cheshire. Most of the counties betwixt the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigations; those upon the Thames and Isis reaching within about 20 miles of those upon the Severn. The duke of Bridgewater's canal in Cheshire runs 27 miles on a perfect level; but at Barton it is carried by a very high aqueduct bridge over the Irwell, a navigable river; so that it is common for vessels to be passing at the same time both under and above the bridge. It is likewise cut some miles into the hills, where the Duke's coal-mines are wrought.

A communication betwixt the Forth and Clyde in Scotland, by a navigable canal, was projected as far back as the year 1722; and on a survey was reported to be practicable. No further notice, however, was taken of this project till the 3^d of December 1761, when the right honourable Francis lord Napier, at his own expence, employed Mr Mackell to make a survey, plan, and estimate thereof, on a very small scale; only capable of carrying lighters or barges, of about 10 or 12 tons burden.

In 1764, the trustees for fisheries, &c. in Scotland, employed Mr John Smeaton to make a survey, plan, and estimate of a canal of five feet depth of water. The expence of this canal was estimated at 78,970*l*. In 1766, Mr Mackell was employed to make another survey, plan, and estimate, of the abovementioned small canal. A number of the most respectable merchants in Glasgow joined in the subscription for it, which was soon filled up: an application was made to parliament; and after the bill was nearly obtained, an opposition was made by the east of Scotland, on account of the smallness of the scale; being only 24 feet medium breadth, by 4 feet depth of water. Upon this, the bill was given up; and a new subscription was set on foot for a canal of 7 feet deep, estimated at 147,337*l*.

Mr Smeaton being appointed principal engineer, and Mr Mackell resident engineer, the work was begun in June 1768; but with some deviation from the original plan, as to its origin and course. It begins at Grange-

burn foot, near the mouth of Carron, where they have a very good harbour called *Green Brae*, for large ships; there being 18 feet of water at the sea-lock, and at very high stream-tides 21 feet. It then proceeds westward three miles, till it comes abreast with the town of Falkirk, the ground rising so little that there are only six locks in that space; though in the fourth mile, which cost about 18,000*l*. there are no less than ten locks, and a very fine aqueduct bridge; under which the great road leading from Edinburgh, by Falkirk, to Glasgow and Stirling, passes: from the fourth mile, or 16th lock, to the east end of Dollator-bog, is six miles; and in that space there are only four locks and seven aqueduct bridges, two of which are considerable, besides small tunnels: at the east end of Dollator-bog, or tenth mile stone, is the 20th lock placed, which begins the canal of partition on the summit betwixt the east and west sea; and which canal of partition continues no less than 18 miles on a level, passing by the south side of Kirkintulloch, and terminates at Hamilton-hill, about a measured mile from Glasgow.

The carrying the canal through the Kerse below Falkirk was attended with little trouble in the digging, though the foundations of the six locks in that track were very troublesome; being in a quick soft mud: the carrying it through Dollator-bog, a soft mud of two miles in length, was attended with more difficulty, and was two years in executing, tho' drained as much as possible a year before the work began; and notwithstanding all this, a part had to be dragged to the depth, after the water was let in to hold down the bottom and prevent it from rising: however, that space is now one of the best parts of the whole canal. Round the point of the Stronhill, opposite to Kilsyth, the canal is banked on the north side for a considerable space above the surface of the ground about 20 feet high, and the water in that place is about 16 feet deep.

There were several places from that to Kirkintulloch to cut through free-stone rock a considerable depth; and at Kirkintulloch the canal is carried over the water of Logie on an aqueduct bridge, whose arch is 90 feet broad; which arch was thrown over in three different stretches, of 30 feet each, having only 30 feet of a centre, which was shifted on small rollers from one stretch to another. Though this was a thing new, and never attempted before with an arch of this size, yet the joinings are as fairly equal as any other part of the arch. This bridge is thought to be a very fine piece of masonry of its kind: on each side there is a very considerable banking over the valley in which the water runs, and which is made up with the soil taken out of a deep cut immediately adjoining thereto on the west side; which cut is not less than 250 yards long, and 42 feet deep.

About two miles west of this the canal goes for near half a mile thro' an open gravel, where it was thought impracticable to make it hold water, as the ground declines suddenly to the north at that place, facing the water of Kelvin; but from the precautions taken to secure that part after the canal was cut through, it proves remarkably tight.

About three miles west from that, the canal goes through the east verge of Polle Loch; and to the westward is cut for a considerable length through a free-stone rock, gray ribs, blaes, and soil on the top, about

Canal.

20 feet deep. About a mile and a half west of that, at a place called *Stockingfield*, the canal turns right to the south; and terminates at Hamilton-hill, within about a mile of Glasgow, where there is a commodious bafon or harbour fit to hold 20 loops at a time. The natural situation of this bafon or harbour, in point of convenience for building warehouses, loading and unloading goods, is acknowledged by every person who has seen it to be exceedingly commodious.

To supply this canal with water, is itself a very great work. The first supply is from a large reservoir formed a mile east of Kilfyth, and supplied with water from three of the feeders of the river Kelvin; which reservoir contains about 50 acres, and is upwards of 24 feet deep. The Kilfyth-burn is carried into this reservoir by an expensive aqueduct of about a mile in length, and the water from the reservoir is also conducted into the canal by an aqueduct cut for that purpose. The next supply is brought by a cut made from the water of Logie, about five miles above Kirkintulloch, to carry off the spare water therefrom, and which falls into the Shirva-burn, and is carried off from that by an aqueduct of about $\frac{1}{2}$ of a mile in length. The third supply is from the lakes that discharge themselves by the Muthland-burn; the water of all which is carried off by an aqueduct of about two miles in length, cut through a hill on the south-west side of Kirkintulloch, and carried into the canal at that place. The fourth supply is from Auchinloch and Loch Grog, carried into the canal by an aqueduct of about two miles in length, cut from near the mouth of the mine which drains Auchinloch, and falls into the canal at Park-burn, west of Kirkintulloch about a mile. There are several other supplies of less consequence; and were more thought necessary, or should become so when the canal is lock'd down to Clyde, a thing much wished for, there can be very great additional supplies got at a moderate expence.

In order to repay the river Kelvin for the feeders which are taken from it into the canal, a large reservoir is formed in Kilmanan-muir, about seven miles north of Glasgow; consisting of 70 acres and $\frac{1}{2}$ banked up at the sluice 22 feet deep. This is thought to be the finest artificial reservoir in Britain; and amply repays the Kelvin for any feeders that can be taken from it. The water of this reservoir is conveyed down the tract of the water of Allinder, which joins the river Kelvin above the uppermost mills built thereon, and supplies the whole in time of drought.

The surface of the water in the canal of partition on the summit betwixt the two seas, is 155 feet above the medium full-sea mark. There are 20 locks on the east side, 20 feet wide by 75 feet long, about 8 feet of rise of the summit; but 19 locks are sufficient on the west side, as the tide does not ebb so low in Clyde as in the Forth by about 9 feet: which make in all 39 locks. There are no less than 18 draw-bridges and 15 aqueduct-bridges of note; besides small ones and tunnels.

It is supposed there is now 150,000*l.* laid out upon this work. If the canal is continued from Stockingfield (where it now turns south to Glasgow), over the river Kelvin, where a great aqueduct bridge is required, and down to Clyde at or near Dalmuir-burn-foot, it is supposed the expence will be above 400,000*l.*

The trade has increased greatly since the canal was opened to Glasgow, and vessels from 30 to 60 tons bur-

den have found their way up it from all ports of the coasts of England and Scotland, in so much that it is thought that the revenues already * amount to about 6000*l.* and that they will still increase greatly.

CANAL, in anatomy, a duct or passage through which any of the juices flow.

CANANOR, a large maritime town of Afia, on the coast of Malabar, in a kingdom of the same name, with a very large and safe harbour. It formerly belonged to the Portuguese, and had a strong fort to guard it; but in 1683, the Dutch, together with the natives, drove them away; and after they became masters of the town, enlarged the fortifications. They have but a very small trade; but there is a town at the bottom of the bay independent of the Dutch, whose prince can bring 20,000 men into the field. The Dutch fort is large, and the governor's lodgings are at a good distance from the gate; so that when there was a skirmish between the factory and the natives, he knew nothing of it till it was over. E. Long. 78. 10. N. Lat. 12. 0.

CANANOR, a small kingdom of Afia, on the coast of Malabar, whose king can raise a considerable army. The natives are generally Mahometans; and the country produces pepper, cardamons, ginger, mirobolans, and tamarinds, in which they drive a considerable trade.

CANARA, a kingdom of Afia, on the coast of Malabar. The inhabitants are Gentoos, or Pagans; and there is a pagod, or temple, called *Ramtrut*, which is visited every year by a great number of pilgrims. Here the custom of burning the wives with their husbands had its beginning, and is practised to this day. The country is generally governed by a woman who keeps her court at a town called *Baydor*, two days journey from the sea. She may marry whom she pleases; and is not obliged to burn with her husband, like her female subjects. They are so good observers of their laws, that a robbery or murder is scarce ever heard of among them. The Canarans have forts built of earth along the coast, which are garrisoned with 200 or 300 soldiers, to guard against the robberies of their neighbours. The lower grounds yield every year two crops of corn or rice; and the higher produce pepper, betel nuts, sanders wood, iron, and steel. The Portuguese clergy here live very loosely, and make no scruple of procuring women for strangers.

CANARIA (anc. geog.), one of the Fortunate Islands, a proof that these were what are now called the *Canaries*. Canaria had its name from its abounding with dogs of an enormous size, two of which were brought to Juba king of Mauritania. See the following article.

CANARIA, or the GRAND CANARY, an island in the Atlantic Ocean, about 180 miles from the coast of Africa. It is about 100 miles in circumference, and 33 in diameter. It is a fruitful island, and famous for the wine that bears its name. It also abounds with apples, melons, oranges, citrons, pomegranates, figs, olives, peaches, and plantains. The fir and palm trees are the most common. The towns are, Canary the capital, Gualdera, and Geria.

CANARY, or CIVIDAD DE PALMAS, is the capital of the island of Canaria, with an indifferent castle, and a bishop's see. It has also a court of inquisition, and the supreme council of the rest of the Canary-islands; as also four convents, two for men, and two for women.

Cananor

||
Canaria.

* First year.

Canary. men. The town is about three miles in compass, and contains 12,000 inhabitants. The houses are only one story high, and flat at the top; but they are well built. The cathedral is a handsome structure. W. Long. 15. 20. N. Lat. 28. 4.

CANARY-ISLANDS, are situated in the Atlantic ocean, over against the empire of Morocco in Africa. They were formerly called the *Fortunate Islands*, on account of the temperate healthy air, and excellent fruits. The land is very fruitful, for both wheat and barley produce 130 for one. The cattle thrive well, and the woods are full of all sorts of game. The Canary singing birds are well known all over Europe. There are here sugar-canes in great abundance; but the Spaniards first planted vines here, from whence we have the wine called *Canary or Sack*.

These islands were not entirely unknown to the ancients; but they were a long while forgot, till John de Betencourt discovered them in 1402. It is said they were first inhabited by the Phœnicians, or Carthaginians, but on no certain foundation; nor could the inhabitants themselves tell from whence they were derived; on the contrary, they did not know there was any other country in the world. Their language, manners, and customs, had no resemblance to those of their neighbours. However, they were like the people on the coast of Barbary in complexion. They had no iron. After the discovery, the Spaniards soon got possession of them all, under whose dominions they are to this day, except Madeira, which belongs to the Portuguese. The inhabitants are chiefly Spaniards; though there are some of the first people remaining, whom they call *Guanches*, who are somewhat civilized by their intercourse with the Spaniards. They are a hardy, active, bold people, and live on the mountains. Their chief food is goat's milk. Their complexion is tawny, and their noses flat. The Spanish vessels, when they sail for the West Indies, always rendezvous at these islands, going and coming. Their number is 12. 1. Alegranza; 2. Canaria; 3. Ferro; 4. Fuerteventura; 5. Gomera; 6. Gratiotia; 7. Lancerotta; 8. Madera; 9. Palma; 10. Rocca; 11. Salvages; 12. Teneriff. West longitude from 12. to 21. north latitude from 27. 30. to 29. 30.

CANARY-BIRD. See FRINGILLA. These birds are much admired for their singing, and take their name from the place from whence they originally came, viz. the Canary-islands; but of late years there is a sort of birds brought from Germany, and especially from Tirol, and therefore called *German birds*, which are much better than the others; though both are supposed to have originally come from the same place. The cocks never grow fat, and by some country people cannot be distinguished from common green-birds; though the Canary-birds are much lustier, have a longer tail, and differ much in the heaving of the passages of the throat when they sing. These birds being so much esteemed for their song, are sometimes sold at a high price, according to the goodness and excellency of their notes; so that it will be always advisable to hear one sing before he is bought. In order to know whether he is in good health, take him out of the store-cage, and put him in a clean cage by himself: if he stand up boldly, without crouching or shrinking in his feathers, look with a brisk eye, and is not subject to clap his head

under his wing, it is a sign that he is in good health; but the greatest matter is to observe his dunging: if he bolts his tail like a nightingale after he has dunged, it is a sign he is not in good health, or at least that he will soon be sick; but if his dung be very thin like water, or of a slimy white without any blackness in it, it is a sign of approaching death. When in perfect health, his dung lies round and hard, with a fine white on the outside, dark within, and dries quickly; though a feed-bird seldom dungs so hard, unless he is very young.

Canary-birds are subject to many diseases, particularly imposthumes, which affect the head, cause them to fall suddenly from the perch, and die in a short time, if not speedily cured. The most approved medicine is an ointment made of fresh butter and capon's grease melted together. With this the top of the bird's head is to be anointed for two or three days, and it will dissolve the imposthume: but if the medicine has been too long delayed, then, after three or four times anointing, see whether the place of his head be soft; and if so, open it gently, and let out the matter, which will be like the yolk of an egg; when this is done, anoint the place, and the bird will be cured. At the same time he must have figs with his other food, and in his water a slice or two of liquorice, with white sugar-candy.

Some are so curious as to breed these birds in Britain; and these have excelled all others. Such of the Canary-birds as are above three years old are called *runts*; those above two, are called *crisses*; those of the first year that the old ones bring up, are called *branchers*; those that are new-fledged and cannot feed themselves, are called *puffers*; and those that are bred up by hand, *nestlings*.

CANCALIE, a town of France, in Upper Brittany, by the sea-side, where there is a road. Here the British landed in 1758, in their way to St Malo, where they burnt a great number of ships in the harbour, and then retired without loss. This town was in their power; but they acted like generous enemies, and did no hurt to this nor any other on the coast. W. Long. 0. 13. N. Lat. 48. 41.

CANCELIER, in falconry, is when a light brown hawk, in her stooping, turns two or three times upon the wing, to recover herself before she seizes.

CANCELLI, a term used to denote lattice windows, or those made of cross-bars, disposed latticewise; it is also used for rails or ballusters inclosing the communion-table, a court of justice, or the like, and for the network in the inside of hollow bones.

CANCELLING, in the civil law, an act whereby a person consents that some former deed be rendered null and void. This is otherwise called *rescission*. The word comes from the Latin *cancellare* to encompass or pale a thing round. In the proper sense of the word, to cancel, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of chequer lattice, which the Latins call *cancelli*.

CANCER, in zoology, a genus of insects belonging to the order of insecta aptera. The generic characters are these: they have eight legs, (sceldom ten or six), besides the two large claws which answer the purpose of hands. They have two eyes at a considerable distance from each other, and for the most part supported by a kind of pedunculi or footstalks; the eyes are likewise elongated and moveable; they have two clawed

Cancer, or
Crab, &c.

clawed palpi, and the tail is jointed. This genus includes the lobster, shrimp, &c. There are no less than 87 species of cancer, distinguished principally by the length of their tails and the margins of their breasts. The following are the most remarkable.

Common
lobster.

1. The gammarus, or common lobster, with a smooth thorax, short serrated snout; very long antennæ; and between them two shorter ones, bifid; claws and fangs large, the greater tuberculated, the lesser serrated on the inner edge; four pair of legs; six joints in the tail; tail-fins rounded. It inhabits all the rocky shores of our island, but chiefly where there is a depth of water. In Llyn in Caernarvonshire, a certain small lobster, nothing different except in size, burrows in the sand. They are brought in vast quantities from the Orkney isles, and many parts of the eastern coast of Scotland, to the London markets. Sixty or seventy thousand are annually brought from the neighbourhood of Montrose alone.—The lobster was well known to the ancients, and is well described by Aristotle under the name of *κραβη*. It is found as far as the Hellespont; and is called at Constantinople *liczuda* and *licpuda*.

Lobsters fear thunder, and are apt to cast their claws on a great clap: it is said that they will do the same on the firing of a great gun; and that, when men of war meet a lobster boat, a jocular threat is used, that, if the master does not sell them good lobsters, they will salute him.

The habitation of this species is in the clearest water, at the foot of rocks that impend over the sea. This has given opportunity of examining more closely into the natural history of the animal, than of many others who live in an element that prohibits most of the human researches, and limits the inquiries of the most inquisitive. Some lobsters are taken by hand; but the greater quantity in pots, a sort of trap formed of twigs, and baited with garbage; they are formed like a wire mouse-trap, so that when the lobster gets in, there is no return. These are fastened to a cord sunk in the sea, and their place marked by a buoy.—They begin to breed in the spring, and continue breeding most part of the summer. They propagate *more humano*, and are extremely prolific. Dr Bailler says he counted 12,444 eggs under the tail, besides those that remained in the body unprotruded. They deposit those eggs in the sand, where they are soon hatched.

Lobsters change their crust annually. Previous to their putting off their old one, they appear sick, languid, and restless. They totally acquire a new coat in a few days; but during the time that they remain defenceless, they seek some very lonely place, for fear of being devoured by such of their brethren as are not in the same situation. It is also remarkable, that lobsters and crabs will renew their claws, if by accident they are torn off; and it is certain they will grow again in a few weeks, though they never attain to the size of the first. They are very voracious animals, and feed on sea-weeds, garbage, and all sorts of dead bodies. The pincers of one of the lobsters large claws are furnished with knobs, and those of the other are always serrated. With the former it keeps firm hold of the stalks of submarine plants, and with the latter it cuts and minces its food very dextrously. The knobbed or *numb* claw, as the fishermen call it, is sometimes on the right and sometimes on the left side indifferently. It is more

dangerous to be seized by them with the cutting claw than the other; but, in either case, the quickest way to get disengaged from the creature is to pull off its claw. The female or *hen* lobster does not cast her shell the same year that she deposits her ova, or, in the common phrase, is in *berry*. When the ova first appear under her tail, they are small, and extremely black; but they become in succession almost as large as ripe elder-berries before they are deposited, and turn of a dark brown colour, especially towards the end of the time of her depositing them. They continue full, and depositing the ova in constant succession, as long as any of that black substance can be found in their body, which, when boiled, turns of a beautiful red colour, and is called their *coral*. Hen-lobsters are found in berry at all times of the year, but chiefly in winter. It is a common mistake, that a berried hen is always in perfection for the table. When her berries appear large and brownish, she will always be found exhausted, watery, and poor. Though the ova be cast at all times of the year, they seem only to come to life during the warm summer-months of July and August. Great numbers of them may then be found, under the appearance of tadpoles, swimming about the little pools left by the tides among the rocks, and many also under their proper form from half an inch to four inches in length. In casting their shells, it is hard to conceive how the lobster is able to draw the fish of their large claws out, leaving the shells entire and attached to the shell of their body, in which state they are constantly found. The fishermen say, the lobster pines before casting, till the fish of its large claw is no thicker than the quill of a goose, which enables it to draw its parts through the joints and narrow passage near the trunk. The new shell is quite membranaceous at first, but hardens by degrees. Lobsters only grow in size while their shells are in their soft state. They are chosen for the table, by their being heavy in proportion to their size; and by the hardness of their shells on their sides, which, when in perfection, will not yield to moderate pressure. Barnacles and other small fish adhering to them are reckoned certain signs of superior goodness. Cock-lobsters are in general better than the hens in winter; they are distinguished by the narrowness of their tails, and by their having a strong spine upon the centre of each of the transverse processes beneath the tail, which support the four middle plates of their tails. The fish of a lobster's claw is more tender, delicate, and easy of digestion, than that of the tail. In summer, the lobsters are found near the shore, and thence to about six fathoms water; in winter, they are seldom taken in less than 12 or 15 fathoms. Like other insects, they are much more active and alert in warm weather than in cold. In the water, they can run nimbly upon their legs or small claws; and, if alarmed, can spring, tail foremost, to a surprising distance, as swift as a bird can fly. The fishermen can see them pass about 30 feet; and, by the swiftness of their motion, suppose they may go much further. Athenæus remarks this circumstance, and says, that "the incurvated lobsters will spring with the activity of dolphins." Their eyes are raised upon moveable bases, which enables them to see readily every way. When frightened, they will spring from a considerable distance to their hold in the rock, and, what is not less surprising than true, will throw themselves into

their hold in that manner through an entrance barely sufficient for their bodies to pass.

2. The *trigofus*, or plated lobster, with a pyramidal spiny snout; thorax elegantly plated, each plate marked near its junction with short striæ; claws much longer than the body, thick, echinated, and tuberculated; the upper fang trifid; only three legs spiny on their sides; tail broad.—The largest of this species is about six inches long. It inhabits the coasts of Anglesea, under stones and fuci. It is very active; and, if taken, flaps its tail against the body with much violence and noise.

Craw-fish,
prawn,
shrimp, &c.

3. The *atacus*, or craw-fish, with a projecting snout slightly serrated on the sides; a smooth thorax; back smooth, with two small spines on each side; claws large, beset with small tubercles; two first pair of legs clawed, the two next subulated, tail consisting of five joints; the caudal fins rounded.—It inhabits many of the rivers in England, lodged in holes which they form in the clayey banks. Cardan says, that this species indicates the goodness of water; for in the best water they are boiled into the reddest colour.

4. The *ferratus*, or prawn, with a long serrated snout bending upwards; three pair of very long filiform feelers; claws small, furnished with two fangs; smooth thorax; five joints to the tail; middle caudal fin subulated, two outmost flat and rounded.—It is frequent in several shores among loose stones; sometimes found at sea, and taken on the surface over 30 fathoms depth of water; cinereous when fresh, of a fine red when boiled.

5. The *crangon*, or shrimp, with long slender feelers, and between them two projecting laminae; claws with a fang, hooked, moveable fang; three pair of legs; seven joints in the tail; the middle caudal fin subulated, the four others rounded and fringed, a spine on the exterior side of each of the outmost.—It inhabits the shores of Britain in vast quantities, and is the most delicious of the genus.

6. The *squilla*, with a snout like a prawn, but deeper and thinner; the feelers longer in proportion to the bulk; the sub-caudal fins rather larger; is, at full growth, not above half the bulk of the former.—It inhabits the coasts of Kent; and is sold in London under the name of the *white shrimp*, as it assumes that colour when boiled.

7. The *atomos*, or atom-lobster, with a slender body; filiform antennæ; three pair of legs near the head; behind which are two pair of oval vesiculæ; beyond are three pair of legs, and a slender tail between the last pair.—It is very minute, and the help of the microscope is often necessary for its inspection.

8. The *pulex*, or flea-lobster, with five pair of legs, and two claws, imperfect; with 12 joints of the body. It is very common in fountains and rivulets; swims very swiftly in an incurvated posture on its back; embraces and protects its young between the legs; does not leap.

9. The *locusta*, or locust-lobster, with four antennæ; two pair of imperfect claws; the first joint ovated; body consists of 14 joints, in which it differs from the former.—It abounds, in summer, on the shores, beneath stones and algæ; leaps about with vast agility.

10. The *diogenes*, soldier-crab, or hermit-crab, with rough claws; the left claw is the longest (this being the only difference between the *diogenes* and *bernardus*);

the legs are subulated, and serrated along the upper ridge; the tail naked and tender, and furnished with a hook by which it secures itself in its lodging. This species is parasitic; and inhabits the empty cavities of turbinated shells, changing its habitation according to its increase of growth from the small *nerite* to the large *subelk*. Nature denies it the strong covering behind, which it has given to others of this class; and therefore directs it to take refuge in the deserted caves of other animals. They crawl very fast with the shell on their back; and at the approach of danger draw themselves within the shell, and, thrusting out the larger claw, will pinch very hard whatever molests them. Aristotle describes it very exactly under the name of *ναρσιον*. By the moderns it is called the *soldier*, from the idea of its dwelling in a tent; or the *hermit*, from retiring into a cell.

It is very diverting to observe this animal when wanting to change its shell. The little soldier is seen busily parading the shore along that line of pebbles and shells which is formed by the extremest wave; still, however, dragging its old inconvenient habitation at its tail, unwilling to part with one shell, even though a troublesome appendage, till it can find another more convenient. It is seen stopping at one shell, turning it, and passing it by; going on to another, contemplating that for a while, and then slipping its tail from its old habitation to try on the new: this also is found to be inconvenient, and it quickly returns to its old shell again. In this manner it frequently changes, till at last it finds one light, roomy, and commodious; to this it adheres, though the shell be sometimes so large as to hide the body of the animal, claws and all. Yet it is not till after many trials, and many combats also, that the soldier is thus completely equipped; for there is often a contest between two of them for some well-looking favourite shell for which they are rivals. They both endeavour to take possession; they strike with their claws, they bite each other, till the weakest is obliged to yield by giving up the object of dispute. It is then that the victor immediately takes possession, and parades it in his new conquest three or four times back and forward upon the strand before his envious antagonist.—When this animal is taken, it sends forth a feeble cry, endeavouring to seize the enemy with its nippers; which if it fastens upon, it will sooner die than quit the grasp.

The hermit-crabs frequent mostly those parts of the sea-shores which are covered with shrubs and trees, producing various wild fruits on which they subsist; though they will also feed on the fragments of fish and other animal substances cast on shore. When roasted in the shell, they are esteemed delicate. The hermit-crab, hung in the air, dissolves into a kind of oil, which speedily cures the rheumatism if rubbed upon the part.

11. The *vocans*, or sand-crab, is but of a small size; its colour light brown, or dusky white. It has eight legs, and two claws, one of which is double the size of the other: these claws serve both to defend and to feed themselves with. The head has two square holes, which are receptacles for its eyes; out of which it thrusts them, and draws them in again at pleasure. Their abode is only on the sandy shores of *Ilathera*, and many others of the Bahama islands. They run very fast, and retreat from danger into little holes they

make

Cancer, or
Crab.

The pea-
crab, &c.

Cancer, or
Crab.

12. The grapsus, or red mottled crab, hath a round body, the legs longer and larger than in other kinds; the claws red; except which, the whole is mottled in a beautiful manner with red and white. These crabs inhabit the rocks hanging over the sea; they are the nimblest of all others, and run with surprising agility along the upright side of a rock, and even under the rocks that hang horizontally below the water. This they are often necessitated to do for eluding the assaults of rapacious birds that pursue them. These crabs never go to land; but frequent mostly those parts of the promontories and islands of rocks in and near the sea, where, by the continual and violent agitation of the waves against the rocks, they are always wet, continually receiving the spray of the sea, which often washes them into it; but they instantly return to the rock again, not being able to live under water, and yet requiring more of that element than any of the crustaceous kinds that are not fish.

13. The granulatus, or rough-shelled crab: these crabs are pretty large, and are commonly taken from the bottom of the sea in shallow water; the legs are small in proportion to the body; the two claws are remarkably large and flat. The whole shell is covered over with innumerable little tubercles like shagreen: the colour is brown, variously stained with purple.

14. The cancer erythropus, or red-claw crab, is of a small size, and brown colour; it hath two claws of unequal bigness, red at the ends; and eight legs, which seem of less use to them than in other crabs; for when on the ground, they crawl with slow pace, dragging their bodies along; but they are mostly seen grasping with their claws, and hanging to some sea-plant, or other marine substance.

15. The pisum, or pea-crab, with rounded and smooth thorax, entire and blunt; with a tail of the size of the body, which commonly is the bulk of a pea. It inhabits the muscle, and has unjustly acquired the repute of being poisonous. The swelling after eating of muscles is wholly constitutional; for one that is affected by it, hundreds remain uninjured. Crabs either of this kind, or allied to them, the ancients believed to have been the consentaneous inmates of the PINNÆ, and other bivalves; which, being too stupid to perceive the approach of their prey, were warned of it by their vigilant friend. Oppian tells the fable prettily.

In clouded deeps below, the pinna hides,
And through the silent paths obscurely glides;
A stupid wretch, and void of thoughtful care,
He forms no halt, nor lays the tempting snare;
But the dull sluggish boasts a crab his friend,
Whose busy eyes the coming prey attend.
One room contains them, and the partners dwell
Beneath the convex of one sloping shell;
Deep in the watry vast the comrades rove,
And mutual interest binds their constant love;
That wifer friend the lucky juncture tells,
When in the circuit of his gaping shells
Fish wand'ring enter; then the bearded guide
Warns the dull mate, and pricks his tender side;
He knows the hint, nor at the treatment grieves,
But hugs th' advantage, and the pain forgives;
His closing shells the pinna sudden joins,
And 'twixt the pressing sides his prey confines:
Thus fed by mutual aid, the friendly pair
Divide their gains, and all the plunder share.

16. The mænas, or common crab, with three not-

ches on the front; five serrated teeth on each side; claws ovated; next joint toothed; hind feet fubulated; dirty green colour; red when boiled. It inhabits all our shores; and lurks under the algae, or burrows under the sand. Is sold, and eaten by the poor of our capitals.

17. The pagurus, or black-clawed crab, with a cre-nated thorax; smooth body; quinque-dentated front; smooth claws and black tips; hind-feet fubulated.—It inhabits the rocky coasts; is the most delicious meat of any; casts its shell between Christmas and Easter. The tips of the claws of this species are used in medicine; intended to absorb acidities in the stomach and bowels.

18. The velutinus, or velvet crab, with the thorax quinque-dentated; body covered with short, brown, velvet-like pile; claws covered with minute tubercles; small spines round the top of the second joint; hind legs broadly ovated.—This is among the species taken notice of by Aristotle on account of the broad feet, which, he says, assist them in swimming; as web-feet do the water-fowl. It inhabits the western coast of Anglesey.

19. The horridus, or horrid-crab, with a projecting Plate bifurcated snout, the end diverging; body heart-
shaped; with the claws and legs covered with long and
very sharp spines.—It is a large species, and inhabits
the rocks on the eastern coasts of Scotland. It is com-
mon to Norway and Scotland, as many of the marine
animals and birds are.

20. The rutilola, land-crab, or violet-crab, with
a smooth entire thorax, and the two last joints of the
feet armed with spines. It inhabits the Bahama islands,
as well as moist lands between the tropics; and feeds
upon vegetables.

These animals live not only in a kind of orderly society in their retreats in the mountains, but regularly once a-year march down to the sea-side in a body of some millions at a time. As they multiply in great numbers, they choose the month of April or May to begin their expedition; and then fallly out by thousands from the stumps of hollow trees, from the clefts of rocks, and from the holes which they dig for themselves under the surface of the earth. At that time the whole ground is covered with this band of adventurers; there is no setting down one's foot without treading upon them. The sea is their place of destination, and to that they direct their march with right-lined precision. No geometrician could send them to their destined station by a shorter course; they neither turn to the right nor left, whatever obstacles intervene; and even if they meet with a house, they will attempt to scale the walls to keep the unbroken tenor of their way. But though this be the general order of their route, they, upon other occasions, are obliged to conform to the face of the country; and if it is intersected with rivers, they are then seen to wind along the course of the stream. The procession sets forward from the mountains with the regularity of an army under the guidance of an experienced commander. They are commonly divided into three battalions; of which the first consists of the strongest and boldest males, that, like pioneers, march forward to clear the route and face the greatest dangers. These are often obliged to halt for want of rain, and to go into the moist conven-

Cancer, or
Crab.

Violet-crab.

Cancer, or
Crab.

Violet-crab.

nient encampment till the weather changes. The main body of the army is composed of females, which never leave the mountains till the rain is set in for some time, and then descend in regular battalia, being formed into columns of 50 paces broad, and three miles deep, and so close that they almost cover the ground. Three or four days after this, the rear-guard follows, a straggling undisciplined tribe, consisting of males and females, but neither so robust nor so vigorous as the former. The night is their chief time of proceeding; but if it rains by day, they do not fail to profit by the occasion; and they continue to move forward in their slow uniform manner. When the fun shines and is hot upon the surface of the ground, they then make an universal halt, and wait till the cool of the evening. When they are terrified, they march back in a confused disorderly manner, holding up their nippers, with which they sometimes tear off a piece of the skin, and then leave the weapon where they insisted the wound. They even try to intimidate their enemies; for they often clatter their nippers together, as if it were to threaten those that come to disturb them. But tho' they thus strive to be formidable to man, they are much more so to each other; for they are possessed of one most unfocial property, which is, that if any of them by accident is maimed in such a manner as to be incapable of proceeding, the rest fall upon and devour it on the spot, and then pursue their journey.

When, after a fatiguing march, and escaping a thousand dangers, (for they are sometimes three months in getting to the shore), they have arrived at their destined port, they prepare to cast their spawn. The peas are as yet within their bodies, and not excluded, as is usual in animals of this kind, under the tail; for the creature waits for the benefit of sea-water to help the delivery. For this purpose the crab has no sooner reached the shore, than it eagerly goes to the edge of the water, and lets the waves wash over its body two or three times. This seems only a preparation for bringing their spawn to maturity; for, without farther delay, they withdraw to seek a lodging upon land: in the mean time the spawn grows larger, is excluded out of the body, and sticks to the barbs under the flap, or more properly the tail. This bunch is seen as big as an hen's egg, and exactly resembling the roes of herrings. In this state of pregnancy they once more seek the shore for the last time; and shaking off their spawn into the water, leave accident to bring it to maturity. At this time whole shoals of hungry fish are at the shore in expectation of this annual supply; the sea to a great distance seems black with them; and about two thirds of the crabs eggs are immediately devoured by these rapacious invaders. The eggs that escape are hatched under the sand; and, soon after, millions at a time of these little crabs are seen quitting the shore, and slowly travelling up to the mountains. The old ones, however, are not so active to return; they have become so feeble and lean, that they can hardly creep along, and the flesh at that time changes its colour. The most of them, therefore, are obliged to continue in the flat parts of the country till they recover, making holes in the earth, which they cover at the mouth with leaves and dirt, so that no air may enter. There they throw off their old shells, which they leave, as it were, quite whole; the place

where they opened on the belly being unseen. At that time they are quite naked, and almost without motion for six days together, when they become so fat as to be delicious food. They have then under their stomachs four large white stones, which gradually decrease in proportion as the shell hardens, and, when they come to perfection, are not to be found. It is at that time that the animal is seen slowly making its way back; and all this is most commonly performed in the space of six weeks.

This animal, when possessed of its retreats in the mountains, is impregnable: for, only subsisting upon vegetables, it seldom ventures out; and its habitation being in the most inaccessible places, it remains for a great part of the season in perfect security. It is only when impelled by the desire of bringing forth its young, and when compelled to descend into the flat country, that it is taken. At that time the natives wait for its descent in eager expectation, and destroy thousands; but, disregarding the bodies, they only seek for that small spawn which lies on each side of the stomach within the shell, of about the thickness of a man's thumb. They are much more valuable upon their return after they have cast their shell; for, being covered with a skin resembling soft parchment, almost every part except the stomach may be eaten. They are taken in the holes by feeling for them with an instrument; they are fought after by night, when on their journey, by flambeaux. The instant the animal perceives itself attacked, it throws itself on its back, and with its claws pinches most terribly whatever it happens to fasten on. But the dexterous crab-catcher takes them by the hinder legs in such a manner that the nippers cannot touch him, and thus he throws them into his bag. Sometimes also they are caught when they take refuge in the bottoms of holes in rocks by the sea-side, by clapping a stick at the mouth of the hole, which prevents their getting out; and then soon after, the tide coming, enters the hole, and the animal is found, upon its retiring, drowned in its retreat.

These crabs are of various sizes, the largest about six inches wide; they walk sideways like the sea-crab, and are shaped like them: some are black, some yellow, some red, and others variegated with red, white, and yellow mixed. Some of these are poisonous; and several people have died of eating of the crabs, particularly of the black kind. The light-coloured are reckoned best; and when full in flesh, are very well tasted. In some of the sugar-islands they are eat without danger; and are no small help to the negro slaves, who, on many of these islands, would fare very hard without them.

CANCER, in medicine, a roundish, unequal, hard, and livid tumour, generally seated in the glandulous parts of the body, supposed to be so called, because it appears at length with turgid veins shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish; or, as others say, because, like that fish, where it has once got, it is scarce possible to drive it away. See (the *Index* subjoined to) MEDICINE.

CANCER, in astronomy, one of the twelve signs, represented on the globe in the form of a crab, and thus marked (♋) in books. It is the fourth constellation in the starry zodiac, and that from which one quadrant of the ecliptic takes its denomination. The reason generally

generally

Cancer
Candiac.

nerally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab-fish. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us; though the disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab.

Tropic of CANCER, in astronomy, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign Cancer.

CANCHERIZANTE, or CANCHERIZATO, in the Italian music, a term signifying a piece of music that begins at the end, being the retrograde motion from the end of a song, &c. to the beginning.

CANDAHAR, a province of Persia, bounded on the north by the province of Balk; on the east, by that of Cabul; on the south, by Buchor and Sablestan; and on the west, by Sigistan. There have been bloody wars between the Indians and Persians on account of this province; but in 1650 it fell to the Persians. The inhabitants are known by the name of *Aghuans*, or *Afghans*, who have often endeavoured to throw off the yoke. But, in 1737, they were severely punished for such an attempt. See PERSIA.

CANDAHAR, the capital of the above province, is seated on a mountain; and being a place of great trade, has a considerable fortress. The caravans that travel from Persia and the parts about the Caspian sea to the East Indies, choose to pass through Candahar, because there is no danger of being robbed on this road, and provisions are very reasonable. The religion is Mahometanism, but there are many Banians and Guebres. E. Long. 67. 5. N. Lat. 33. o.

CANDAULES, the last king of Lydia, of the family of the Heraclides, was so proud of the beauty of his wife, that he had the folly to let Giges, his favourite, see her naked, while she was bathing. The queen, enraged at this action, which, according to the opinion of the Lydians, rendered her infamous, persuaded Giges to murder Candaules; after which he married him, about 716 years before the birth of Christ. In him began the race of the Merminades, which lasted till the defeat of Cæsus.

CANDELARES (from *candela* a candle), the name of an order in the former editions of Linnæus's Fragments of a natural method, consisting of these three genera, *rhizophora*, *nyssa*, and *minussops*. They are removed, in the latter editions, into the order *HOLORACEÆ*; which see.

CANDIA, the modern name of the island of Crete. See CRETE.

CANDIA, or *Mutium*, is the capital of the above island, situated on its northern coast, in E. Long. 25. o. N. Lat. 35. 30.

CANDIAC (John Lewis), a premature genius, born at Candiac in the diocese of Nîmes in France, in 1719. In the cradle he distinguished his letters: at 13 months, he knew them perfectly: at three years of age, he read Latin, either printed or in manuscript: at four, he translated from that tongue: at six, he read Greek and Hebrew; was master of the principles of arithmetic, history, geography, heraldry, and the science of medals; and had read the best authors on almost every branch of literature. He died of a complication of disorders, at Paris, in 1726.

CANDIDATE, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown during the two years of their soliciting a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes, and also that they might more easily show to the people the scars of those wounds they had received in fighting for the defence of the commonwealth. The candidates usually declared their pretensions a year before the time of election, which was spent in making interest and gaining friends. Various arts of popularity were practised for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which was called *ambitus*. See AMBITUS.

CANDIDATI MILITES, an order of soldiers, among the Romans, who served as the emperor's bodyguards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called *candidati*, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

CANDISH, a considerable province of Asia, in the dominions of the Great Mogul, bounded by Chytor and Malva on the north, Oriza on the east, Decan on the south, and Guzarat on the west. It is populous and rich; and abounds in cotton, rice, and indigo. Brampor is the capital town.

CANDLE, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together.

A tallow-candle, to be good, must be half sheep's and half bullock's tallow; for hog's tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an unconstant vibratory flame, which is both prejudicial to the eyes, and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles; the one dipped, the other moulded: the former are the common candles; the others are the invention of the sieur le Brege at Paris.

As to the method of making candles, in general; After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lumps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skimmed, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate, to the bottom of the vessel, the impurities of the tallow, which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being still quite dry, would imbibe the water, which makes the candles crackle in burning, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use 24 hours in summer, and 15 in winter.

Candidate
Candle.

Candle. winter. The wicks are made of spun cotton, which the tallow-chandlers buy in skains, and which they wind up into bottoms or clues. Whence they are cut out, with an instrument contrived on purpose, into pieces of the length of the candle required; then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded.

Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds: some of a conical figure, used to illuminate churches, and in processions, funeral ceremonies, &c. (see TAPER); others of a cylindrical form, used on ordinary occasions. The first are either made with a ladle or the hand. 1. To make wax-candles with the ladle. The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended over a large basin of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its destined bigness; with this precaution, that the three first ladles be poured on at the top of the wick, the fourth at the height of $\frac{1}{2}$, the fifth at $\frac{2}{3}$, and the sixth at $\frac{3}{4}$, in order to give the candle its pyramidal form. Then the candles are taken down, kept warm, and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom. 2. As to the manner of making wax-candles by the hand, they begin to soften the wax, by working it several times in hot water, contained in a narrow but deep caldron. A piece of the wax is then taken out, and disposed by little and little, around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing till as they descend towards the neck. In other respects the method is nearly the same as in the former case. However, it must be observed, that, in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made, as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually drawn in the manner of wire, by means of two large rollers of wood, turned by a handle, which, turning backwards and forwards several times, pass the wick through melted wax contained in a brass basin, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the basin.

Makers of candles are not to use melting-houses, without due entry thereof at the excise-office, on pain of 100 l. and to give notice of making candles to the excise-officer for the duties, and of the number, &c. or shall forfeit 50 l. Removing the candles before weighed by the officer, or mixing them with others, is likewise liable to penalties.

Spermaceti CANDLES. See SPERMACETI.

N. B. The time that one candle lasted was taken from an average of several trials in each size.

CANDLE is also a term in medicine, and is reckoned among the instruments of surgery. Thus the *candela fumalis*, or the *candela pro fuffitu odorata*, is a mass of an oblong form, consisting of odoriferous powders, mixed up with a third or more of the charcoal of willow or lime tree, and reduced to a proper consistence with a mucilage of gum tragacanth, labdanum, or turpentine. It is intended to excite a grateful smell without any flame, to correct the air, to fortify the brain, and to excite the spirits.

Medicated CANDLE, the same with BOUGIE.

CANDLE. Sale or auction by inch of candle, is when, a small piece of candle being lighted, the bystanders are allowed to bid for the merchandize that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder.

There is also an excommunication by inch of candle; when the finner is allowed to come to repentance while a candle continues burning; but after it is consumed, he remains excommunicated to all intents and purposes.

Rush-CANDLES, used in different parts of England, are made of the pith of a sort of rushes, peeled or stripped from the skin, except on one side, and dipped in melted grease.

CANDLE-Wood, slips of pine about the thickness of a finger, used in New England and other colonies to burn instead of candles, giving a very good light. The French inhabitants of Tortuga use slips of yellow santal-wood for the same purpose and under the same denomination, which yields a clear flame, though of a green colour.

CANDLEBERRY TREE, in botany, the English name of the MYRICA.

CANDLEMAS, a feast of the church held on the second day of February, in honour of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used abundance

Candle
|
Candlemas.

Candlestick,
Candy.

dance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being on that day declared by Simon "to be a light to lighten the Gentiles." In imitation of this custom, the Roman-catholics on this day consecrate all the tapers and candles which they use in their churches during the whole year. At Rome, the Pope performs that ceremony himself; and distributes wax-candles to the cardinals and others, who carry them in procession through the great hall of the Pope's palace. This ceremony was prohibited in England by an order of council in 1548.

CANDLESTICK, an instrument to hold a candle, made in different forms, and of all sorts of matter.

The golden candlestick was one of the sacred utensils made by Moses to be placed in the Jewish tabernacle. It was made of hammered gold, a talent in weight. It consisted of seven branches supported by a base or foot. These branches were adorned at equal distances with six flowers like lilies, and with as many bowls and knobs placed alternately. Upon the stock and six branches of the candlestick were the golden lamps, which were immoveable, wherein were put oil and cotton.

These seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the cotton in or out, and dishes underneath them to receive the sparks or droppings of the oil. This candlestick was placed in the antichamber of the sanctuary on the south side, and served to illuminate the altar of perfume and the tabernacle of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks of the same form as that described by Moses, five on the north and five on the south side of the holy. But, after the Babylonish captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This sacred utensil, upon the destruction of the temple by the Romans, was lodged in the temple of peace built by Vespasian; and the representation of it is still to be seen on the triumphal arch at the foot of mount Palatine, on which Vespasian's triumph is delineated.

CANDY, a large kingdom of Asia, in the island of Ceylon. It contains about a quarter of the island; and as it is encompassed with high mountains, and covered with thick forests, through which the roads and paths are narrow and difficult, the king has them guarded, to prevent his subjects from going into other countries. It is full of hills, from whence rivulets proceed which are full of fish; but as they run among the rocks, they are not fit for boats; however, the inhabitants are very dextrous in turning them to water their land, which is fruitful in rice, pulse, and hemp. The king is absolute, and his subjects are idolaters. The capital town is of the same name.

CANDY, a town of Asia, and capital of a kingdom of the same name, in the island of Ceylon. It has been often burnt by the Portuguese, when they were masters of these coasts. The houses are very poor, low, and badly furnished. E. Long. 79. 12. N. Lat. 7. 35.

CANDY, or *Sugar-Candy*, a preparation of sugar made by melting and crystallizing it six or seven times over, to render it hard or transparent. It is of three kinds, white, yellow, and red. The white comes from the loaf-sugar, the yellow from the cassonado, and the

red from the muscavado.

CANDYING, the act of preserving simples in substance, by boiling them in sugar. The performance of this originally belonged to the apothecaries, but is now become a part of the business of the confectioner.

CANE, in botany. See **ARUNDO**.

CANE, denotes also a walking stick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots, about two inches distance from one another. These last have very little elasticity, and will not bend so well as the others.

Canes of Bengal are the most beautiful which the Europeans bring into Europe. Some of them are so fine, that people work them into bowls or vessels, which being varnished over in the inside, with black or yellow lacca, will hold liquors as well as glass or China ware does; and the Indians use them for that purpose.

CANE is also the name of a long measure, which differs according to the several countries where it is used.

At Naples the cane is equal to 7 feet $3\frac{1}{2}$ inches English measure: the cane of Tholouse and the Upper Languedoc, is equal to the varre of Arragon, and contains five feet $8\frac{1}{2}$ inches; at Montpellier, Provence, Dauphine, and the Lower Languedoc, to six English feet $5\frac{1}{2}$ inches.

CANEA, a strong and considerable town of the island of Candia, where a bashaw resides. It is inhabited by 1500 Turks, 2000 Greeks, some Jews, and a few French merchants, with their consul. The harbour is pretty good; but the fortifications are much out of repair. The environs of the town are admirable; being adorned with forests of olive-trees mixed with fields, vineyards, gardens, and brooks bordered with myrtle-trees and laurel-roses. The chief revenue of this town consists in oil-olive. E. Long. 24. 15. N. Lat. 35. 28.

CANELLA ALBA, a kind of bark rolled up in long quills, thicker than cinnamon, and both outwardly and inwardly of a whitish colour, lightly inclining to yellow. It is the produce of a tall tree growing in great plenty in the lowlands in Jamaica and other American islands. The canella is the interior bark freed from an outward thin rough one, and dyed in the shade. The shops distinguish two sorts of canella, differing from one another in the length and thickness of the quills: they are both the bark of the same tree, the thicker being taken from the trunk, and the thinner from the branches. This bark is a warm pungent aromatic, not of the most agreeable kind, nor are any of the preparations of it very grateful.*

CANELLE, or **CANE-LAND**, a large country in the island of Ceylon, called formerly the *kingdom of Cota*. It contains a great number of cantons, the principal of which are occupied by the Dutch. The chief riches of this country consists in cinnamon, of which there are large forests. There are five towns on the coast, some forts, and a great number of harbours. The rest of the country is inhabited by the natives; and there are several rich mines, from whence they get rubies, sapphires, topazes, cats-eyes, and several other precious stones.

CANEPHORÆ, in Grecian antiquity, virgins who, when they became marriageable, presented certain baskets.

Candyng
||
Canelle.* See *Materia Medica*, no 101.

Canephoria kets full of little curiosities to Dians, in order to get leave to depart out of her train, and change their state of life.

CANEPHORIA, in Grecian antiquity, a ceremony which made part of a feast, celebrated by the Athenian virgins, on the eve of their marriage-day.—At Athens the canephoria consisted in this; that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents, to engage the goddess to make the marriage-state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protectrix of virginity, for abandoning her party; or as a ceremony to appease her wrath. Suidas calls it a festival in honour of Diana.

CANEPHORIA, is also the name of a festival in honour of Bacchus, celebrated particularly by the Athenians, on which the young maids carried golden baskets full of fruit, which baskets were covered, to conceal the mystery from the uninitiated.

CANES, in Egypt and other eastern countries, a poor sort of buildings for the reception of strangers and travellers. People are accommodated in these with a room at a small price, but with no other necessities; so that, excepting the room, there are no greater accommodations in these houses than in the deserts, only that there is a market near.

CANETO, a strong town of Italy in the duchy of Mantua, seated on the river Oglio, which was taken by the Imperialists in 1701, by the French in 1702, afterwards by the Imperialists, and then by the French in 1705. E. Long. 10. 45. N. Lat. 40. 55.

CANGA, in the Chinese affairs, a wooden clog borne on the neck, by way of punishment for divers offences. The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offence. Some cangas weigh 200 lb; the generality from 50 to 60. The Mandarin condemn to the punishment of the canga. Sentence of death is sometimes changed for this kind of punishment.

CANGE (Charles du Fresnoy sieur du), one of the most learned writers of his time, was born at Amiens in 1610, and studied at the Jesuits college in that city. Afterwards he applied himself to the study of the law at Orleans, and gained great reputation by his works, among which are, 1. The history of the empire of Constantinople under the French emperors. 2. John Cinnamus's six books of the history of the affairs of John and Manuel Comnenus, in Greek and Latin, with historical and philological notes. 3. *Glossarium ad Scriptores medie & infime Latinitatis*.

CANICULA, is a name proper to one of the stars of the constellation *canis major*, called also simply the *dog-star*; by the Greeks *Sirius* *. Canicula is the tenth in order in the Britanic catalogue; in Tycho's and Ptolemy's it is the second. It is situated in the mouth of the constellation; and is of the first magnitude, being the largest and brightest of all the stars in the heavens. From the rising of this star not cosmically, or with the sun, but heliacally, that is, its emergence from the sun's rays, which now happens about the 15th day of August, the ancients reckoned their *dies caniculares*, or dog-days. The Egyptians and Ethiopians began their year at the rising of the canicula, reckoning to its rise

again the next year, which is called the *annus canarius*, or canicular year. This year consisted ordinarily of 365 days, and every fourth year of 366, by which it was accommodated to the civil year. The reason of their choice of the canicula before the other stars to compute their time by, was not only the superior brightness of that star, but because its heliacal rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile, the reputed father of Egypt. Ephellion adds, that from the aspect and colour of canicula, the Egyptians drew prognostics concerning the rise of the Nile; and, according to Florus, predicted the future state of the year; so that the first rising of this star was annually observed with great attention.

CANICULUM, or **CANICULUS**, in the Byzantine antiquities, a golden standish or ink-vessel, decorated with precious stones, wherein was kept the sacred *encaustum*, or red ink, wherewith the emperors signed their decrees, letters, &c. The word is by some derived from *canis*, or *caniculus*; alluding to the figure of a dog which it represented, or rather because it was supported by the figures of dogs. The caniculum was under the care of a particular officer of state.

CANINA, the north part of the ancient Epirus, a province of Greece, which now belongs to the Turks, and lies off the entrance of the gulph of Venice. The principal town is of the same name, and is seated on the sea-coast, at the foot of the mountains of Chimera. E. Long. 19. 25. N. Lat. 40. 55.

CANINANA, in zoology, the name of a species of serpent found in America, and esteemed one of the less poisonous kinds. It grows to about two feet long; and is green on the back, and yellow on the belly. It feeds on eggs, and small birds; the natives cut off the head and tail, and eat the body as a delicate dish.

CANINE, whatever partakes of, or has any relation to, the nature of a dog.

CANINE Appetite, amounts to much the same with **BULIMY**.

CANINE Madness. See (the *Index* subjoined to) **MEDICINE**.

CANINE Teeth, are two sharp-edged teeth in each jaw; one on each side, placed between the incisores and molares.

CANINI (John Angelo and Marc Anthony), brothers and Romans, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads; Marc engraved them. They were encouraged by Colbert to publish a succession of heads of the heroes and great men of antiquity, designed from medals, antique stones, and other ancient remains; but John died at Rome soon after the work was begun: Marc Anthony, however, procured assistance, finished and published it in Italian in 1669. The cuts of this edition were engraved by Canini, Picard, and Valet; and a curious explanation is given, which discovers the skill of the Canini's in history and mythology. The French edition of Amsterdam, 1731, is spurious.

CANIS, or **Dog**, in zoology, a genus of quadrupeds, belonging to the order of *feræ*. The characters of the dog are these: he has six fore-teeth in the upper jaw, those in the sides being longer than the intermediate ones, which are lobated; in the under jaw there are likewise six fore-teeth, those on the sides being lobated.

* See *Sirius*.

The Dog.

bated. He has six grinders in the upper, and seven in the lower jaw. The teeth called *dog-teeth* are four, one on each side, both in the lower and upper jaw; they are sharp-pointed, bent a little inward, and stand at a distance from any of the rest.

There are eight species of this genus, *viz.*

I. The *FAMILIARIS*, or domestic dog, is distinguished from the other species, by having his tail bent to the left side; which mark is so singular, that perhaps the tail of no other quadruped is bent in this manner. Of this species there are a great number of varieties. Linnæus enumerates 11, and Buffon gives figures of no less than 27.—The mastiff is about the size of a wolf, with the sides of the lips hanging down, and a full robust body. The large Danish dog differs only from the former in being fuller in the body, and generally of a larger size. The gre-hound is likewise the same with the mastiff; but its make is more slender and delicate. Indeed the difference betwixt these three dogs, although perfectly distinguishable at first sight, is not greater than that betwixt a Dutchman, a Frenchman, and an Italian. The shepherd's dog, the wolf-dog, and what is commonly called the *Siberian dog*, to which may be joined the Lapland dog, the Canada dog, and, in general, all those which have strait ears and a pointed snout, are all one kind, differing only in thickness, the roughness or smoothness of their skin, the length of their legs, and tails. The hound or beagle, the terrier, the braque or harrier, and the spaniel, may be considered as the same kind: they have the same form and the same instincts; and differ only in the length of their legs, and size of their ears, which in each of them are long, soft, and pendulous. The bull-dog, the small Danish dog, the Turkish dog, and the Iceland dog, may likewise be considered as the same kind, all the varieties in their appearance taking their rise merely from climate. For instance, the Turkish dog, which has no hair, is nothing else but the small Danish dog transported to a warm climate, which makes the hair fall off. A dog of any kind loses its hair in very warm climates. But this is not the only change which arises from difference of climate. In some countries, the voice is changed; in others, dogs become altogether silent. In some climates they lose the faculty of barking, and howl like wolves, or yelp like foxes. Warm climates even change their form and instincts: they turn ill-shaped, and their ears become strait and pointed. It is only in temperate climates that dogs preserve their natural courage, ardour, and sagacity.

In order to give an idea of the different kinds of dogs in different climates, and of the varieties produced by mixtures, we shall give an explanation of Buffon's genealogical tree, see Plate LXX. fig. 1. This tree is constructed in the form of a geographical chart, in which the situation of the different climates to which the particular dogs belong, is observed as accurately as the nature of the thing will admit.

The shepherd's dog is the stump of the tree; this dog, when transported to Lapland, or any very cold climate, assumes an ugly appearance, and its legs become short. But, in Britain, Russia, Siberia, &c. where the cold is not so rigorous, and the people are more civilized, he arrives at greater perfection, both in form and sagacity. The same shepherd's dog, when brought up in a country fully civilized, as Britain or France,

loses his savage air, his strait ears, his thick long hair, and becomes what is called a *bull-dog*, a *mastiff*, a *beagle*, or hound. These changes, Buffon attributes to the influence of the climate, the manners of the people, &c. The mastiff and the bull-dog have their ears still partly strait, or half-pendent, and resemble in their manners and sanguine disposition the dog from which they derive their origin. The beagle or hound preserves less of the appearance of its origin than the other two; its ears are long and entirely pendent; the softness, the tractability, the timidity of this dog, Buffon considers as so many proofs of its great degeneracy, or rather of that perfection which it acquires by culture and living among a civilized people.

The hound, the small spotted setting-dog, and the terrier, are all of the same family; for all the three kinds are often produced at the same litter, although the female hound had been covered only by one of these kinds.

When the hound is transported to Spain, or Barbary, where almost every animal has fine, long, downy hair, it is changed into a water-hound, or spaniel. And the small and large spaniel, which differ only in the tail, when carried to Britain, are changed from a white to a black colour, and become what are called the *large* and *small shagged dogs*.

The mastiff, when carried to the north, is changed into the large Danish dog; and when transported to the south, it becomes a gre-hound. The large gre-hounds come from the Levant; those of a lesser size come from Italy; and the Italian gre-hounds, when brought to Britain, become what the French call *levrons*, that is, gre-hounds of the least size.

The great Danish dog, when carried to Ireland, the Ukraine, Tartary, &c. is changed into the Irish dog, which is the largest of all dogs.

The bull-dog, when carried from Britain to Denmark, becomes the small Danish dog; and this small Danish dog, when transported into a warm climate, loses its hair, and is changed into the Turkish dog.

All these races or families, with their varieties, are produced by the influence of climate, food, and education: the other kinds marked in the tree are not pure or distinct families, but are produced by the commixture of the other families. These mongrel dogs, with the particular parents which produce them, are marked out in the tree by dotted lines. For example,

The gre-hound and mastiff produce the mongrel gre-hound, which is likewise called the *gre-hound with wolf's hair*. The large Danish dog and the large spaniel produce the Calabrian dog; which is a beautiful dog, with long bushy hair, and of a larger size than the mastiff. The spaniel and the small Danish dog produce the lion-dog, which is a very rare kind. It is needless to give more examples, as they can easily be traced from the dotted lines in the tree.

Dr Caius has left, among several other tracts relating to natural history, one written expressly on the species of *British dogs*: besides a brief account of the variety of dogs then existing in this country, he has added a systematic table of them: his method is so judicious, that we shall make use of the same; explain it by a brief account of each kind; and point out those that are no longer in use amongst us.

The Dog.

SYNOPSIS OF BRITISH DOGS.

The Dog.

I. The most generous kinds.	Dogs of chase.	Hounds.	Terrier
			Harrier
			Blood-hound
II. Farm Dogs.	Dogs of fowling.	Fowling.	Gaze-hound
			Gre-hound
			Leviner, or Lyemmer
III. Mon- grels.	Lap Dogs.	Spaniel.	Tumbler
			Spaniel
			Setter
	Dogs of chase.	Dogs of chase.	Water-spaniel, or finder
			Spaniel gentle, or comforter
			Shepherd's dog
	Dogs of fowling.	Fowling.	Maliff, or ban dog.
			Wappe
			Turnspit
	Dogs of chase.	Dogs of chase.	Dancer.

a. The first variety is the *terrarius*, or terrier, which takes its name from its subterraneous employ; being a small kind of hound used to force the fox, or other beasts of prey, out of their holes; and, in former times, rabbits out of their burrows into nets.

b. The *leverarius*, or harrier, is a species well known at present: it derives its name from its use, that of hunting the hare; but under this head may be placed the fox-hound, which is only a stronger and swifter variety, applied to a different chase.

c. The *fanguinarius*, blood-hound, or *sleut-hounde* of the Scots, was a dog of great use, as already noticed under the article *Blood-Hound*.

The next division of this species of dogs comprehends those that hunt by the eye; and whose success depends either upon the quickness of their sight, their swiftness, or their subtlety.

d. The *agaseus*, or gaze-hound, was the first: it chased indifferently the fox, hare, or buck. It would select from the herd the fattest and fairest deer; pursue it by the eye; and, if lost for a time, recover it again by its singular distinguishing faculty; nay, should the beast rejoin the herd, this dog would fix unerringly on the same. This species is now lost, or at least unknown to us.

e. The next kind is the *leporarius*, or gre-hound. Dr Caius informs us, that it takes its name *quod precipui gradus sit inter canes*, "the first in rank among dogs:" that it was formerly esteemed so, appears from the forest-laws of king Canute, who enacted that no one under the degree of a gentleman should presume to keep a gre-hound; and still more strongly from an old Welsh saying which signifies, that "you may know a gentleman by his hawk, his horse, and his gre-hound."

The variety called the *Highland gre-hound*, and now become very scarce, is of very great size, strong, deep-chested, and covered with long rough hair. This kind was much esteemed in former days, and used in great numbers by the powerful chieftains in their magnificent

hunting-matches. It had as sagacious nostrils as the blood-hound, and was as fierce.

f. The third species is the *levinarius*, or *lorarius*; the *leviner* or *lyemmer*: the first name is derived from the lightness of the kind; the other from the old word *lyemie*, a thong; this species being used to be led in a thong, and dipped at the game. Our author says that this dog was a kind that hunted both by scent and sight; and in the form of its body observed a medium between the hound and the gre-hound. This probably is the kind now known among us by the name of the *Irish gre-hound*, a dog now extremely scarce in that kingdom, the late king of Poland having procured from them as many as possible. They were of the kind called by Buffon *le grand Danois*, and probably imported there by the Danes who long possessed that kingdom. Their use seems originally to have been for the chase of wolves with which Ireland swarmed till the latter end of the last century. As soon as these animals were extirpated, the numbers of the dogs decreased; for, from that period, they were kept only for state.

g. The *vertagus*, or tumbler, is a fourth species; which took its prey by mere subtlety, depending neither on the sagacity of its nose, nor its swiftness: if it came into a warren, it neither barked, nor ran on the rabbits; but by a seeming neglect of them, or attention to something else, deceived the object till it got within reach, so as to take it by a sudden spring. This dog was less than the hound, more scrappy, had prick ears, and by Dr Caius's description seems to answer to the modern lurcher.

The third division of the more generous dogs comprehends those which were used in fowling.

h. First, the *Hispanielus*, or spaniel: from the name, it may be supposed that we were indebted to Spain for this breed. There were two varieties of this kind: the first used to spring the game, which are the same with our starters. The other variety was used only for the net, and was called *index*, or the setter; a kind well known at present. This kingdom has been long remarkable for producing dogs of this sort, particular care having been taken to preserve the breed in the utmost purity. They are still distinguished by the name of *English spaniel*; so that, notwithstanding the derivation of the name, it is probable they are natives of Great Britain.

i. The *aquaticus*, or fynder, was another species used in fowling; was the same with our water-spaniel; and was used to find or recover the game that was shot.

k. The *Meliteus*, or *sitor*, the spaniel gentle or comforter of Dr Caius (the modern lap-dog), was the last of this division. The Maltese little dogs were as much esteemed by the fine ladies of past times, as those of Bologna are among the modern. Old Hollingshed is ridiculously severe on the fair of his days, for their excessive passion for these little animals; which is sufficient to prove that it was, in his time*, a novelty.

2. The second grand division of dogs comprehends the *rustici*, or those that were used in the country.

a. The first species is the *pastorali*, or shepherd's dog; which is the same that is used at present, either in guarding our flocks, or in driving herds of cattle. This kind is so well-trained for these purposes, as to attend to every part of the herd be it ever so large; confine them to the road; and force in every straggler, without doing it the least injury.

b. The

* The reign of queen Elizabeth.

b. The next is the *villaticus*, or *catenarius*; the mastiff or band dog; a species of great size and strength, and a very loud barker. Caius tells us that three of these were reckoned a match for a bear; and four for a lion: but from an experiment made in the Tower of London, that noble quadruped was found an unequal match to only three. Two of the dogs were disabled in the combat, but the third forced the lion to seek for safety by flight. The English bull-dog seems to belong to this species; and probably is the dog our author mentions under the title of *lanarius*. Great Britain was so noted for its mastiffs, that the Roman emperors appointed an officer in this island under the name of *procurator cynegii*, whose sole business was to breed, and transmit from hence to the amphitheatre, such as would prove equal to the combats of the place. Grattius speaks in high terms of the excellency of the British dog.

Cynegestus,
lin. 175.

*Atque ipse libet penetrare Britannos?
O quanta est merces, et quantum impendia supra!
Si non ad speciem, mentisque de oris
Protinus: hec una est castis iussura Britannis.
At magnum cum venit opus, promendaque virtus,
Et vocat extremo preceps discrimine Mavors,
Non tunc egregios tantum admirare Molossos.
If Britain's distant coast we dare explore,
How much beyond the coast the valued store;
If shape and beauty not alone we prize,
Which nature to the British hound denies;
But when the mighty toil the husman wars,
And all the soul is rous'd by fierce alarms,
When Mars calls furious to th' ensanguin'd field,
Even bold Molossians then to these must yield.*

Strabo tells us that the mastiffs of Britain were trained to war, and were used by the Gauls in their battles; and it is certain, a well trained mastiff might be of use in distressing such half-armed and irregular combatants, as the adversaries of the Gauls seem generally to have been before the Romans conquered them.

3. The last division is that of the *degeneres*, or curs.

a. The first of these was the *vaappe*, a name derived from its note; its only use was to alarm the family by barking, if any person approached the house.

b. Of this class was the *versator*, or turn-spit; and lastly the *saltator*, or dancing-dog; or such as was taught variety of tricks, and carried about by idle people as a show. These *degeneres* were of no certain shape, being mongrels or mixtures of all kinds of dogs.

HAVING thus traced the varieties of the dog, and noticed the peculiarities of each, we shall now give its general natural history.

From the structure of the teeth, it might be concluded *a priori* that the dog is a carnivorous animal. He does not, however, eat indiscriminately every kind of animal substance. There are some birds, as the colymbus arcticus, which the water-dog will lay hold of with his kennels, but will not bring out of the water, because its smell is exceedingly offensive to him. He will not eat the bones of a goose, crow, or hawk: but he devours even the putrid flesh of most other animals. He is possessed of such strong digestive powers, as to draw nourishment from the hardest bones. When flesh cannot be procured, he will eat fish, fruits, succulent herbs, and bread of all kinds. When oppressed with sickness, to which he is very subject, especially in the beginning of summer, and before ill weather, in order to procure a puke, he eats the leaves of the quicken-grafs,

the bearded wheat-grafs, or the rough cock's-foot grafs, which gives him immediate relief. When he steals a piece of flesh, as conscious of the immorality of the action, he runs off with his tail hanging and bent in between his feet.

His drink is water, which he takes in small quantities at a time, by licking with his tongue. He is in some measure obliged to lick in this manner, otherwise his nose would be immerged in the water.

His excrements are generally hard scybals, which, especially after eating bones, are white, and go by the name of *album græcum* among physicians. This album græcum was for a long time in great repute as a septic; but it is now entirely disregarded. He does not throw out his excrements promiscuously upon every thing that happens to be in the way, but upon stones, trunks of trees, or barren places. This is a wise institution of nature; for the excrements of a dog destroy almost every vegetable or animal substance. They are of such a putrid nature, that if a man's shoe touches them when recently expelled, that particular part will rot in a few days. He observes the same method in making his urine, which he throws out at a side. It is remarkable, that a dog will not pass a stone or a wall against which any other dog has pissed, without following his example, although a hundred should occur in a few minutes, in so much that it is astonishing how such a quantity can be secreted in so short a time.

The dog is an animal not only of quick motion, but remarkable for travelling very long journeys. He can easily keep up with his master, either on foot or horseback, for a whole day. When fatigued, he does not sweat, but lolls out his tongue. Every kind of dog can swim; but the water-dog excels in that article.

The dog runs round when about to lie down, in order to discover the most proper situation. He lies generally on his breast, with his head turned to one side, and sometimes with his head above his two fore-feet. He sleeps little, and even that does not seem to be very quiet; for he often starts, and seems to hear with more acuteness in sleep than when awake. They have a tremulous motion in sleep, frequently move their legs, and bark, which is an indication of dreaming.

Dogs are possessed of the sensation of smelling in a high degree. They can trace their master by the smell of his feet in a church, or in the streets of a populous city. This sensation is not equally strong in every kind. The hound can trace game, or his master's steps, 24 hours afterwards. He barks more furiously the nearer he approaches the fowls, unless he be beat and trained to silence.

The dog eats enviously, with oblique eyes: is an enemy to beggars: bites at a stone flung at it: is fond of licking wounds: howls at certain notes in music, and often urinates on hearing them.

With regard to the propagation of dogs; the females admit the males before they are 12 months old. They remain in season 10, 12, or even 15 days, during which time they will admit a variety of males. They come in season generally twice in the year, and more frequently in the cold than in the hot months. The male discovers the condition of the female by the smell; but she seldom admits him the first six or seven days. One coitus will make her conceive a great number of young; but, when not restrained, she will admit several dogs

Canis.

The Dog.

every day: she seems to have no choice or predilection, except in favour of large dogs: from this circumstance, it sometimes happens, that a small female, who has admitted a mastiff, perishes in bringing forth her young. During the time of copulation, these animals cannot separate themselves, but remain united so long as the erection subsists. This is owing to the structure of the parts. The dog has not only a bone in his penis, but in the middle of the corpus cavernosum there is a large hollow, which is blown up in the time of erection to a considerable bulk. The female, on the other hand, has a larger clitoris than perhaps any other animal; besides, a large firm protuberance rises in the time of copulation, and remains perhaps longer than that of the male, and prevents him from retiring till it subsides: accordingly, after the act of copulation is over, the male turns about in order to rest himself on his legs, and remains in that position till the parts turn flaccid. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth five, four, and sometimes but two. They continue to copulate and bring forth during life, which lasts generally about 14 or 15 years. The whelps are commonly blind, and cannot open their eyes, till the 10th or 12th day: the males are like the dog, the females like the bitch. In the fourth month, they lose some of their teeth, which are soon succeeded by others.

The dog has such a strong resemblance to the wolf and the fox, that he is commonly supposed to be the production of one or other of these animals tamed and civilized. Buffon informs us, that he kept a young dog and a young wolf together till they were three years of age, without their discovering the least inclination to copulate. He made the same experiment upon a dog and a fox; but their antipathy was rather increased when the female was in season. From these experiments he concludes, that dogs, wolves, and foxes, are perfectly distinct species of animals. There has, however, been lately an instance to the contrary. Mr Brooke, animal-merchant in Holborn, turned a wolf to a Pomeranian bitch in heat; the congress was immediate, and as usual between dog and bitch: she produced ten puppies. Mr Pennant says he saw one of them that had very much the resemblance of a wolf, and also much of its nature; being slipped at a weak deer, it instantly caught at the animal's throat and killed it.

With regard to the natural disposition of the dog: in a savage state, he is fierce, cruel, and voracious; but, when civilized and accustomed to live with men, he is possessed of every amiable quality. He seems to have no other desire than to please and protect his master. He is gentle, obedient, submissive, and faithful. These dispositions, joined to his almost unbounded sagacity, justly claim the esteem of mankind. Accordingly no animal is so much caressed or respected: he is so docile, and so much formed to please, that he assumes the very air and temper of the family in which he resides.

An animal endowed with such uncommon qualities must answer many useful purposes. His fidelity and vigilance are daily employed to protect our persons, our flocks, or our goods. The acuteness of his smell gains him employment in hunting: he is frequently employed as a turnspit: at Brussels and in Holland, he is train-

ed to draw little carts to the herb-market; and in Siberia, draws a sledge with his master in it, or loaden with provisions.

The dog is liable to many diseases, as the scab, mad-nels, &c. and he seldom wants the tenia or tape-worm in his guts, especially if he drinks dirty water. [See Plate LXX. and LXXI.]

II. The second species of this kind is the LUPUS, or wolf, which is distinguished from the dog by having its tail turned inward. The wolf is larger and fiercer than a dog. His eyes sparkle, and there is a great degree of fury and wildness in his looks. He draws up his claws when he walks, to prevent his tread from being heard. His neck is short, but admits of very quick motion to either side. His colour is generally blackish. Like most ferocious animals, he can bear hunger a very long time; but, at last, when the appetite for victuals becomes intolerable, he grows perfectly furious, and will attack men, horses, dogs, and cattle of all kinds; even the graves of the dead are not proof against his rapacity. This circumstance is finely described, in the following lines.

By wintry famine rous'd,
Cruel as death, and hungry as the grave!
Burning for blood! bony, and ghast, and grim!
Assembling wolves in raging troops descend;
And, pouring o'er the country, bear along,
Keen as the north-wind sweeps the glossy snow.
All is their prize. They fasten on the dead,
Press him to earth, and pierce his mighty heart,
Nor can the bull his awful front defend,
Or shake the murdering savages away.
Ravenous at the mother's throat they fly,
And tear the screaming infant from her breast.
The god-like face of Man avails him nought.
Even beauty, force divine! at whose bright glance
The generous lion stands in soften'd gaze,
Here bleeds, a hapless undistinguish'd prey.
But if, appris'd of the severe attack,
The country be shut up, lur'd by the scent,
On church-yards drear (inhuman to relate!)
The disappointed prowlers fall, and dig
The shrouded body from the grave; o'er which,
Mix'd with foul shades, and frighted ghosts, they howl.

THOMSON'S WINTER.

The wolf is extremely suspicious, and, unless pressed with hunger, seldom ventures out of the woods. They make a howling noise in the night, and assemble together in troops in order to devour their prey. The females are in heat in winter; and followed by several males, which occasions great combats. She goes with young ten weeks; near her time, prepares a soft bed of moss, in some retired place; and brings forth from five to nine at a birth.—The wolf is a native of Europe, and frequents the woods of many parts of the continent to this day. The teeth of this animal are large and sharp; and its bite is terrible, as its strength is great. The hunters therefore clothe their dogs, and guard their necks with spiked collars. Wolves are proscribed animals, destroyed by pit-falls, traps, or poison; a peasant in France who kills a wolf, carries its head from village to village, and collects some small reward from the inhabitants: the Kirghis-Khaissaks take the wolves by the help of a large hawk called *berkut*, which is trained for the diversion, and will fasten on them and tear out their eyes. This island, a few centuries ago, was much infested by them. It was, as appears by Hollinghed, very noxious to the flocks in Scotland in 1577; nor was it entirely extirpated till about 1680, when

WOLF.

Canis.

when the last wolf fell by the hand of the famous Sir Ewen Cameron. We may therefore with confidence assert the non-existence of these animals, notwithstanding M. de Buffon maintains that the English pretend to the contrary.—It has been a received opinion, that the other parts of these kingdoms were in early times delivered from this pest by the care of king Edgar. In England he attempted to effect it by commuting the punishments of certain crimes into the acceptance of a certain number of wolves tongues from each criminal; and in Wales, by converting the tax of gold and silver into an annual tax of 300 wolves heads. But, notwithstanding these his endeavours, and the assertions of some authors, his scheme proved abortive. We find, that, some centuries after the reign of that Saxon monarch, these animals were again increased to such a degree, as to become again the object of royal attention: accordingly Edward I. issued out his royal mandate to Peter Corbet to superintend and assist in the destruction of them in the several counties of Gloucester, Worcester, Hereford, Salop, and Stafford; and in the adjacent county of Derby, (as Camden, p. 902, informs us), certain persons at Wormhill held their lands by the duty of hunting and taking the wolves that infested the country, whence they were styled *wolve-hunt*. To look back into the Saxon times, we find, that in Athelstan's reign wolves abounded so in Yorkshire, that a retreat was built at Flixton in that county, "to defend passengers from the wolves, that they should not be devoured by them;" and such ravages did those animals make during winter, particularly in January, when the cold was severe, that the Saxons distinguished that month by the name of the *wolf-month*. They also called an outlaw *wolf's-head*, as being out of the protection of the law, proscribed, and as liable to be killed as that destructive beast. Ireland was infested by wolves for many centuries after their extinction in England; for there are accounts of some being found there as late as the year 1710, the last presentment for killing of wolves being made in the county of Cork about that time. [Plate LXXI. fig. 5.]

The Hyæna.

III. The *HYÆNA* has a strait jointed tail, with the hair of its neck erect, small naked ears, and four toes on each foot. It inhabits Asiatic Turkey, Syria, Persia, and Barbary. Like the jackal, it violates the repositories of the dead, and greedily devours the putrid contents of the grave; like it, preys on the herds and flocks; yet, for want of other food, will eat the roots of plants, and the tender shoots of the palms: but, contrary to the nature of the former, it is an unsociable animal; is solitary, and inhabits the chafms of the rocks. The superstitious Arabs, when they kill one, carefully bury the head, lest it should be employed for magical purposes; as the neck was of old by the Thesalian sorcerers.

Viscera non lyncis, non dire nodus hyænae
Defuili. Lucan, vi. 672.

The ancients were wild in their opinion of the *hyæna*: they believed that its neck consisted of one bone without any joint; that it changed its sex; imitated the human voice; had the power of charming the shepherds, and, as it were, rivetting them to the place they stood on: no wonder that an ignorant Arab should attribute preternatural powers to its remains. They are cruel, fierce, and untameable animals, of a most male-

Canis.

volent aspect; have a sort of obstinate courage, which will make them face stronger quadrupeds than themselves. Kæmpfer relates, that he saw one which had put two lions to flight, regarding them with the utmost coolness. Their voice is hoarse, a disagreeable mixture of growling and roaring.

Mr Pennant describes a variety of this species, undistinguished by former naturalists, which he calls the *spotted hyæna*. It has a large and flat head; some long hairs above each eye; very long whiskers on each side of the nose; a short black mane; hair on the body short and smooth; ears short and a little pointed, their outside black, inside cinereous; face and upper part of the head black; body and limbs reddish brown, marked with distinct black round spots; the hind legs with black transverse bars; the tail short, black, and full of hair. It inhabits Guinea, Ethiopia, and the Cape: lives in holes in the earth, or cliffs of the rocks; preys by night; howls horribly; breaks into the folds, and kills two or three sheep; devours as much as it can, and carries away one for a future repast; will attack mankind, scrape open graves, and devour the dead. Bosman has given this creature the name of *jackal*; by which Buffon being misled, makes it synonymous with the common jackal.

The Fox.

IV. The *VULPES*, or fox, has a strait tail, white at the point. His body is yellowish, or rather straw-coloured; his ears are small and erect; his lips are whitish, and his forefeet black. From the base of the tail a strong scent is emitted, which to some people is very fragrant, and to others extremely disagreeable. The fox is a native of almost every quarter of the globe, and is of such a wild and savage nature that it is impossible fully to tame him. He is esteemed to be the most crafty of all beasts of prey. His craftiness is chiefly discovered by the schemes he falls upon in order to catch lambs, geese, hens, and all kinds of small birds. When the females are in season, they make a disagreeable yelping noise in the night. It breeds only once in a year, (except some accident befalls the first litter), and brings four or five young, which, like puppies, are born blind. It is a common received opinion, that this animal will produce with the dog kind: which may be well founded; since it has been proved that the congenerous wolf will, as noticed above. The fox flies when he hears the explosion of a gun, or smells gunpowder. He is exceedingly fond of grapes, and does much mischief in vineyards. Various methods are daily employed to destroy foxes: they are hunted with dogs; iron traps are frequently set at their holes; and their holes are sometimes smoked to make them run out, that they may the more readily fall into the snares, or be killed by dogs or fire-arms. But all the arts that have been employed are insufficient for rooting them out of any country. They have so many passages in their dens, frequently at a great distance, that they often make their escape. The fox sleeps much in the day, but is in motion the whole night in search of prey. It will feed on flesh of any kind; but its favourite food is lambs, rabbits, hares, poultry, and feathered game: it will, when urged by hunger, eat carrots and insects; and those that live near the sea-coasts, for want of other food, will eat crabs, shrimps, or shell-fish. The fox is a great destroyer of rats, and field-mice; and, like the cat, will play with them a considerable time before

Canis.
The Fox.

Canis.
The Fox.

before it puts them to death. When the fox has acquired a larger prey than it can devour at once, it never begins to feed till it has secured the rest, which it does with great address. It digs holes in different places; returns to the spot where it had left the booty; and (supposing a whole flock of poultry to have been its prey) will bring them one by one, and thrust them in with its nose, and then conceal them by ramming the loose earth on them till the calls of hunger incite him to pay them another visit. Of all animals the fox has the most significant eye, by which it expresses every passion of love, fear, hatred, &c. It is remarkably playful; but, like all savage creatures half reclaimed, will on the least offence bite those it is most familiar with. It is a great admirer of its bushy tail, with which it frequently amuses and exercises itself, by running in circles to catch it: and, in cold weather, wraps it round its nose. The smell of this animal is in general very strong, but that of the urine is remarkably fetid. This seems to offensive even to itself, that it will take the trouble of digging a hole in the ground, stretching its body at full length over it; and there, after depositing its water, cover it over with the earth, as the cat does its dung. The smell is so offensive, that it has often proved the means of the foxes escape from the dogs; who have so strong an aversion to the filthy effluvia, as to avoid encountering the animal it came from. It is said that the fox makes use of its urine as an expedient to force the cleanly badger from its habitation: whether that is the means, is rather doubtful; but that the fox makes use of the badger's hole, is certain: not through want of ability to form its own retreat, but to save itself some trouble; for after the expulsion of the first inhabitant, the fox improves as well as enlarges it considerably, adding several chambers, and providently making several entrances to secure a retreat from every quarter. In warm weather, it will quit its habitation for the sake of basking in the sun, or to enjoy the free air; but then it rarely lies exposed, but chooses some thick brake, that it may rest secure from surprize. Crows, magpies, and other birds, who consider the fox as their common enemy, will often, by their notes of anger, point out its retreat.—The skin of this animal is furnished with a warm soft fur, which in many parts of Europe is used to make muffs and to line clothes. Vast numbers are taken in Le Valais, and the Alpine parts of Switzerland. At Lausanne there are furriers who are in possession of between 2000 and 3000 skins, all taken in one winter. Plate LXXI. fig. 4.

Of the fox there are several varieties; as,

1. The field-fox, or *alopex* of Linnæus, who makes it a distinct species; but it is every way the same with the common fox, except in the point of the tail, which is black.

2. The cross-fox, with a black mark passing transversely from shoulder to shoulder, with another along the back to the tail. It inhabits the coldest parts of Europe, Asia, and North-America: a valuable fur, thicker and softer than the common sort: great numbers of the skins are imported from Canada.

3. The black fox is the most cunning of any, and its skin the most valuable; a lining of it is, in Russia, esteemed preferable to the finest fables: a single skin will sell for 400 rubles. It inhabits the northern parts

of Asia, and North-America. The last is inferior in goodness.

4. The brant fox, as described by Gesner and Linnæus, is of a fiery redness; and called by the first *brand-fuchz*, by the last *brandraef*: it is scarce half the size of the common fox: the nose is black, and much sharper; the space round the ears ferruginous; the forehead, back, shoulders, thighs, and sides black mixed with red, ash-colour and black; the belly yellowish; the tail black above, red beneath, and cinereous on its side. It is a native of Pennsylvania.

5. The coriac-fox, with upright ears, soft downy hair; tail bushy; colour in summer pale tawney, in winter grey: the base and tip of the tail black: a small kind. It inhabits the deserts beyond the Yaik: lives in holes: howls and barks: is caught by the Kirgis Khaissacks with falcons and grey-hounds: 40 or 50,000 are annually taken, and sold to the Russians, at the rate of 40 kopeiks, or 20 pence, each: the former use their skins instead of money: great numbers are sent into Turkey.

6. There are three varieties of foxes found in the mountainous parts of these islands, which differ a little in form, but not in colour, from each other. They are distinguished in Wales by as many different names. The *milgi*, or *grey-bound fox*, is the largest, tallest, and boldest; and will attack a grown sheep or wether: the *maffiff-fox* is less, but more strongly built: the *corgi*, or *cur-fox*, is the least; lurks about hedges, out-houses, &c. and is the most pernicious of the three to the feathered tribe. The first of these varieties has a white tag or tip to the tail; the last a black. When hunted, they never run directly forward, but make a great many doublings and turnings; and when in danger of being taken, they emit such a smell from their posteriors that the hunters can hardly endure it.

V. The *LAGOPUS*, or arctic fox, with a sharp nose; short rounded ears, almost hid in the fur; long and soft hair, somewhat woolly; short legs; toes covered on all parts, like that of a common hare, with fur; tail shorter and more bushy than that of the common fox, of a bluish grey or ash colour, sometimes white: the young of the grey are black before they come to maturity: the hair much longer in winter than summer, as is usual with animals of cold climates. It inhabits the countries bordering on the Frozen Sea; Khamtchatka, the isles between it and America, and the opposite parts of America discovered in captain Bering's expedition, 1741; is again found in Greenland, Iceland, Spitzbergen, Nova Zembla, and Lapland. It burrows underground, forms holes many feet in length; and strews the bottom with moss. In Greenland and Spitzbergen it lives in the cliffs of rocks, not being able to burrow, by reason of the frost: two or three pair inhabit the same hole. They are in heat about Lady-day; and during that time, they continue in the open air, but afterwards take to their holes. They go with young nine weeks: like dogs, they continue united, in copulation: they bark like that animal, for which reason the Russians call them *pesuzi*, or dogs. They have all the cunning of the common fox; prey on geese, ducks, and other water-fowl, before they can fly; on grouse of the country, on hares, and the eggs of birds; and in Greenland (through necessity), on berries, shell-fish, or any thing the sea flings up. But their prin-

Canis.

principal food in the north of Asia and in Lapland, is the leming, or Lapland marmot: those of the countries last mentioned are very migratory, pursuing the leming which is a wandering animal: sometimes these foxes will desert the country for three or four years, probably in pursuit of their prey; for it is well known that the migrations of the leming are very inconstant, it appearing in some countries only once in several years. The people of Jenesa suspect they go to the banks of the Oby. They are taken in traps: oft-times the glutton and great owl destroy them before the hunter can take them out: the skins are of small value: the great rendezvous of these animals is on the banks of the Frozen Sea, and the rivers that flow into it, where they are found in great troops.

The
Jackal, &c.

VI. The *AUREUS*, or jackal; of the form of a wolf, but much less; and the colour of a bright yellow. It inhabits all the hot and temperate parts of Asia; is found in Barbary and other parts of Africa as low as the Cape of Good Hope. They go in packs of 40, 50, and even of 200; and hunt like hounds in full cry, from evening to morning: they destroy the flocks and poultry; ravage the streets of villages, and gardens near towns, and will even destroy children that are unprotected: they will enter stables and out-houses, and devour skins, and any thing else formed of that material: there is scarce any animal they will leave unmolested: in default of living prey, they will feed on roots, fruits, and the most infected carrion: they will greedily disinter the dead, and feed on putrid corpses; for which reason, in many countries, the graves are made of a great depth, and well secured against their attacks: they attend caravans, and follow armies, in hopes that death will provide them a banquet: their howls and clamours are dreadful; and so loud, that people can scarce hear one another speak: during the day they are silent, and retire to their dens. Drellon says, that they are sometimes tamed, and kept among other domestic animals.

This animal is commonly called the *lion's provider*, from an opinion that it rouses the prey for that bad-nosed quadruped. The fact is, that every creature in the forest is set in motion by the fearful cries of the jackals; the lion, and other beasts of prey, by a kind of instinct, attend to the chase, and seize such timid animals as betake themselves to flight at the noise of this nightly pack. It is described by Oppian under the name *ΑΥΡΟΣ ΕΥΒΕΤΗΣ*, or *yellow wolf*; who mentions its horrible howl. It is strange that an animal so common in the Levant, should never have been brought over to be described by any modern naturalist. The descriptions yet remain very obscure; and there is still a great uncertainty whether the jackal and the adive of Mr Buffon are the same or different animals.

VII. The *MEXICANUS* has a smooth crooked tail. The body is ash-coloured, variegated with yellow spots. It is a native of Mexico, and is called the *mountain-cat* by Seba. It agrees with the European wolf in its manners; attacks cattle, and sometimes men.

VIII. The *THOUS* has a smooth crooked tail; the upper part of its body is grey, and its belly white. It is about the size of a large cat; and, according to Linnaeus, is found at Surinam: it is mentioned by no other naturalist.

CANIS Major, the *Great Dog*, in astronomy, a con-

stellation of the southern hemisphere, below Orion's feet, tho' somewhat to the westward of him. For the number of his stars, see *ASTRONOMY*, n° 206.

CANIS Minor, the *Little Dog*, in astronomy, a constellation of the northern hemisphere; called also by the Greeks *procyon*, and by the Latins *antecanis*, and *canicula*. See *CANICULA*; and *ASTRONOMY*, n° 206.

CANISIUS (Henry), a native of Nimeguen, and one of the most learned men of his time, was professor of canon law at Ingolstadt; and wrote a great number of books, the principal of which are, 1. *Summa Juris Canonici*. 2. *Antique lectiones*, a very valuable work. He died in 1609.

CANKER, a disease incident to trees, proceeding chiefly from the nature of the soil. It makes the bark rot and fall. If the canker be in a bough, cut it off; in a large bough, at some distance from the stem; in a small one, close to it: but for over-hot strong ground, the ground is to be cooled about the roots with pond-mud and cow-dung.

CANKER, among farriers, See *FARRIERY*, § xlv. 2.

CANNA, *INDIAN CANE*; a genus of the monogynia order, belonging to the monandria class of plants.

Species. 1. The indica, or common broad-leaved flowering cane, is a native of both Indies; the inhabitants of the British islands in America call it *Indian shot*, from the roundness and hardness of the seeds. It hath a thick, fleshy, tuberous root, which divides into many irregular knobs; it sends out many large oval leaves, without order. At their first appearance the leaves are like a twisted horn, but afterwards expand, and are near a foot long, and five inches broad in the middle; lessening gradually to both ends, and terminated in a point. The stalks are herbaceous, rising four feet high, and are encompassed by the broad leafy foot-stalks of the leaves; at the upper part of the stalk the flowers are produced in loose spikes, each being at first covered with a leafy hood, and turns to a brown colour. The flowers are succeeded by a fruit or capsule, oblong, rough, and crowned with the three-cornered empalement of the flower which remains. When the fruit is ripe, the capsule opens lengthwise into three cells, filled with round, shining, hard, and black seeds. 2. The latifolia, with a pale red flower, is a native of Carolina, and some other northern provinces of America. 3. The glauca, with a very large flower, is a native of South America. 4. The lutea, with obtuse, oval leaves, is less common in America than the other sorts. 5. The coccinea, hath larger leaves than any of the other species, and the stalks rise much higher. The flowers are produced in large spikes; and are of a bright crimson, or rather scarlet colour.

Culture. These plants must always be kept in pots of rich earth, to be moved to shelter in winter. They are propagated by seeds sown on a hot-bed in the spring; and in summer, when the plants are a little advanced in growth, prick them separately in small pots of rich earth, plunging them also in the hot-bed, giving shade, water, and fresh air; to which last harden them by degrees, till they bear it fully. In October they must be removed into a very good stove or greenhouse.

CANNABIS, *HEMP*; a genus of the pentandria order, belonging to the dioecia class of plants. Of this there is but one species, viz. the sativa. This is propa-

Canis
||
Cannabis.

Cannab.

Hemp.

Cannab.

pagated in the rich fenny parts of Lincolnshire in great quantities, for its bark, which is useful for cordage, cloth, &c. and the seeds abound with oil. Hemp is always sown on a deep, moist, rich soil, such as is found in Holland, Lincolnshire, the fens of the island of Ely, where it is cultivated to great advantage, as it might be in many other parts of England where there is a foil of the same kind; but it will not thrive on clayey or stiff cold land. The ground on which hemp is designed to be sown should be well ploughed, and made very fine by harrowing. About the middle of April the seed may be sown; three bushels is the usual allowance for an acre, but two are sufficient. In the choice of the seed, the heaviest and brightest coloured should be preferred; and particular care should be had to the kernel of the seed. For the greater certainty in this matter, some of the seeds should be cracked, to see whether they have the germ or future plant perfect: for, in some places, the male plants are drawn out too soon from the female; i. e. before they have impregnated the female plants with the farina; in which case, though the seeds produced by these females may seem fair to the eye, yet they will not grow*, according to the doctrine of Linnaeus. When the plants are come up, they should be hoed out in the same manner as is practised for turnips, leaving them two feet apart; observe also to cut down all the weeds, which, if well performed, and in dry weather, will destroy them. This crop, however, will require a second hoeing, in about six weeks after the first; and, if this is well performed, the crop will require no further care. The first season for pulling hemp is usually about the middle of August, when they begin to pull what they call the *finble hemp*, being that which is composed of the male plants; and it would be the much better method to defer this for a fortnight or three weeks longer, until those male plants have fully shed their farina or dust, without which the seeds will prove only empty hulks. These male plants decay soon after they have shed their farina. The second pulling is a little after Michaelmas, when the seeds are ripe. This is usually called *karle hemp*, and consists of the female plants which were left. This karle hemp is bound in bundles of a yard compass, according to statute measure, which are laid in the sun for a few days to dry; and then it is stacked up, or hoisted, to keep it dry till the seed can be threshed out. An acre of hemp, on a rich soil, will produce near three quarters of seed, which, together with the unwrought hemp, is worth from six to eight pounds. Hemp is esteemed very effectual for destroying weeds: but this it accomplishes by impoverishing the ground, and thus robbing them of their nourishment; so that a crop of it must not be repeated on the same spot.—From the leaves of hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor of which they are very fond. The plant, when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the tough rind for mechanic uses, is said to be violently poisonous, and to produce its effects almost as soon as drunk. The seeds also have some smell of the herb, and their taste is unctuous and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like. They are also said to be useful in incontinence of

urine, and for restraining venereal appetites; but experience does not warrant their having any virtues of that kind.

CANNÆ, (anc. geog.), a mean hamlet of Apulia in the Adriatic, at the mouth of the river Aufidus; raised out of obscurity by a most terrible overthrow given the Romans by the Carthaginians under Hannibal. The Roman consuls were C. Terentius Varro, and L. Emilius Paulus. Their army was vastly superior in numbers to the Carthaginians; but the latter were superior in cavalry. Notwithstanding, however, that the Romans were no fewer than 87,000, so great was the fame of Hannibal, that the consuls were divided in their opinion as to the venturing of an engagement. Emilius was for avoiding a battle, and accordingly encamped on the eminences where the cavalry of the enemy could not act; but next day, it being Varro's turn to command, he advanced into the plain in which Cannæ was situated, and brought the army into such a situation that an engagement became unavoidable. The Romans were then drawn up in the usual manner; the *hæstati* in the first line, the *principes* in the second, and the *triarii* in the third. The cavalry were posted on the wings. On the right, the Roman knights flanked the legionaries; in the left, the cavalry of the allies covered their own infantry. The two consuls commanded the two wings, Emilius the right, and Terentius the left; and the two procursors Servilius and Attilius the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot, and 10,000 horse, placed his Gaulish and Spanish cavalry in his left wing, to face the Roman knights; and the Numidian horse in his right, over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidian. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no projection. Asdrubal commanded the left wing; Maherbal the right; and Hannibal himself, with his brother Mago, the main body. He had also taken care to post himself in such a manner that the wind *Vulturnus*, which rises at certain stated times, should blow directly in the faces of the Romans during the fight, and cover them with dust. The onset was begun by the light-armed infantry; the Romans discharging their javelins, and the *baleares* their stones, with pretty equal success; nevertheless, the consul Emilius was wounded. Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish in Hannibal's left. As they were shut in by the river Aufidus on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismounted, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed; put the Romans to the rout; and, pursuing them along the river, strewed the ground with their dead bodies, Asdrubal giving no quarter. This

ac-

*See Botany, sect. iii.

Cannæ
Cannon.

action was scarce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. These gave ground, and, pursuant to Hannibal's directions, sunk into the void space in their rear; by which means they insensibly brought the Romans into the centre of the African infantry, and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans, being by this artful retreat drawn into the snare and surrounded, no longer kept their ranks, but formed several platoons, in order to face every way. Emilius, who was on the right wing, seeing the danger of the main body, at the head of his legionaries acted the part both of a soldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left, attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in the mean time, Afrubal, at the head of a detachment of Gaulish and Spanish infantry brought from the centre, attacked Emilius's legionaries with such fury, that they were forced to give ground and fly: the consul being all covered with wounds, was at last killed by some of the enemy who did not know him. In the main body, the Romans, though involved on all sides, continued to sell their lives dear; fighting in platoons, and making a great slaughter of the enemy. But being at length overpowered, and disheartened by the death of the two proconsuls Servilius and Attilius who headed them, they dispersed and fled, some to the right, and others to the left, as they could find opportunity; but the Numidian horse cut most of them in pieces: the whole plain was covered with heaps of dead bodies, inasmuch that Hannibal himself, thinking the butchery too terrible, ordered his men to put a stop to it.—There is a great disagreement among authors as to the number of Romans killed and taken at the battle of Cannæ. According to Livy, the republic lost 50,000 men including the auxiliaries. According to Polybius, of 6000 Roman horse, only 700 escaped to Venusia with Terentius Varro, and 300 of the auxiliary horse. As to the infantry, that writer tells us, that 70,000 of the Roman foot died on the field of battle fighting like brave men; and that 13,000 were made prisoners. According to Dionysius of Halicarnassus, of 6000 horse, only 370 escaped the general slaughter, and of 80,000 foot, 3000 only were left. The most moderate computation makes the number of Romans killed to amount to 45,000.

CANNEL COAL. See AMPHELITES.

CANNES, a town of France, in Provence, and in the viceroy of Grasse, seated on the coast of the Mediterranean sea, with a harbour and a castle. E. Long. 7. 7. N. Lat. 43. 34.

CANNON, a military engine for throwing balls, &c. by the help of GUNPOWDER.

The invention of brass cannon is by Laney ascribed to J. Owen: he says, that they were first known in England in the year 1535; but yet acknowledges, that, in 1346, there were four pieces of cannon in the English army at the battle of Cressly, and that these were the first that were known in France. And Mezeray relates, that king Edward, by five or six pieces

VOL. III.

of cannon, struck terror into the French army, it being the first time they had seen any of these thundering machines *. The Germans carry the invention farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250. Vossius rejects all these opinions, and finds cannon in China almost 1700 years ago. According to him, they were mounted by the emperor Kiteiy in the year of Christ 85.

For the casting of cannon, see FOUNDERY. For their different parts, proportions, management, operation, and effects, see GUNNERY.

CANNON, with letter-founders and printers, the name of the largest size of letters they use.

CANNONADE, the application of artillery to the purposes of war, or the direction of its efforts against some distant object intended to be seized or destroyed, as a ship, battery, or fortress. See GUNNERY.

Since a large ship of war may be considered as a combination of floating batteries, it is evident that the efforts of her artillery must be greatly superior to those of a fortress on the sea-coast; that is to say, in general; because, on some particular occasions, her situation may be extremely dangerous, and her cannonading ineffectual. Her superiority consists in several circumstances, as the power of bringing her different batteries to converge to one point; of shifting the line of her attack so as to do the greatest possible execution against the enemy, or to lie where she will be the least exposed to his shot; and chiefly because, by employing a much greater number of cannon against a fort than it can possibly return, the impression of her artillery against stone-walls soon becomes decisive and irresistible. Besides these advantages in the attack, she is also greatly superior in point of defence: because the cannon-ship, passing with rapidity through her sides, seldom do any execution out of the line of their flight, or occasion much mischief by their splinters; whereas they very soon shatter and destroy the faces of a parapet, and produce incredible havoc among the men by the fragments of the stones, &c. A ship may also retreat when she finds it too dangerous to remain longer exposed to the enemy's fire, or when her own fire cannot produce the desired effect. Finally, the fluctuating situation of a ship, and of the element on which she rests, renders the effects of bombs very uncertain, and altogether destroys the effect of the *ricochet*, or rolling and bounding shot, which is so pernicious and destructive in a fortress or land engagement. The chief inconvenience to which a ship is exposed, on the contrary, is, that the low-laid cannon in a fort near the brink of the sea, may strike her repeatedly on or under the surface of the water, so as to sink her before her cannonade can have any considerable efficacy.

CANNULA, in surgery, a tube made of different metals, principally of silver and lead, but sometimes of iron.

They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance; or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen: they are used in the operation of bronchotomy; and, by some, after cutting for the stone, as a drain for urine.

Other cannulas are used for introducing cauteries, either actual or potential, into hollow parts, in order to guard the parts adjacent to that to be cauterized,

9 U from

Cannon.
Cannula.
* See *Artillery*.

from injury. They are of various figures; some being oval, some round, and others crooked.

CANO, a kingdom of Africa, in Negroland, with a town of the same name. It is bounded by Zaara on the north, by the river Niger on the south, the kingdom of Agades on the west, and that of Cassina on the east. Some of the inhabitants are herdsmen, and others till the ground and dwell in villages. It produces corn, rice, and cotton. Here are also many deserts, and mountains covered with woods, in which are wild citrons and lemon-trees. The walls and houses of the town are made of clay, and the principal inhabitants are merchants. E. Long. 16. 18. N. Lat. 21. 5.

CANOBIA, a town of Italy, in the duchy of Milan, situated on the western bank of Lago Maggiore, or the Greater Lake. E. Long. 8. 47. N. Lat. 45. 55.

CANOE, a sort of Indian boat or vessel, formed of the trunk of a tree hollowed, and sometimes of several pieces of the bark put together.

Canoes are of various sizes, according to the uses for which they may be designed, or the countries wherein they are formed. The largest are made of the cotton tree; some of them will carry between 20 and 30 hogheads of sugar or molasses. Some are made to carry sail: and for this purpose are steeped in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other sorts very rarely carry sail, unless when going before the wind: their sails are made of a sort of short silk grass or rushes. They are commonly rowed with paddles, which are pieces of light wood somewhat resembling a corn-funnel; and, instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breadth, and seven or eight lengthwise. The rowers, who are generally American savages, are very expert in managing their paddles uniformly, and in balancing the canoes with their bodies; which would be difficult for a stranger to do, how well accustomed soever to the conducting of European boats, because the canoes are extremely light, and liable to be overturned. The American Indians, when they are under the necessity of landing to avoid a water-fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again.—This is the general construction of canoes, and method of managing them: but some nations have vessels going under the name of canoes, which differ considerably from the above; as the inhabitants of Greenland, Hudson's-bay, Otaheite, &c. See GREENLAND, &c.

CANON, commonly called *prebendary*, a person who possesses a prebend, or revenue allotted for the performance of divine service in a cathedral or collegiate church. Originally, canons were only priests, or inferior ecclesiastics, who lived in community, residing near the cathedral church to assist the bishop, depending entirely on his will, supported by the revenues of his bishopric, and living in the same house as his domestics or counsellors, &c. By degrees these communities of priests, shaking off their dependence, formed separate bodies; in time they freed themselves from their rules, and at length ceased to live in a community. It is maintained, that the colleges of canons, which have

been introduced into each cathedral, were not in the ancient church, but are of modern appointment.

In the Romish church, when a person is promoted to the office of a canon, he must be presented in a very ceremonious manner to the chapter, who assemble in the cathedral, in order to receive him: he kisses the altar thrice, after which he goes and takes his place in the choir; he afterwards makes his confession of faith aloud, and swears to observe the ordinances of the church and his holiness the pope: being thus solemnly installed, he is empowered to assist at the chapter, to chaunt the office of the choir, &c.

Canons are of various kinds; as,

Cardinal CANONS, those attached, or, as the Latins call it, *incardinati*, to a church, as a priest is to a parish.

Domicellary CANONS, young canons, who, not being in orders, had no right in any particular chapters.

Expectative CANONS were such as, without having any revenue or prebend, had the titles and dignities of canons, a voice in the chapter, and a place in the choir, till such time as a prebend should fall.

Foreign CANONS, such as did not officiate in the canonries to which they belonged. To these were opposed *manfionary* canons.

Regular CANONS, those who still live in community, and who, like religious, have, to the practice of their rules, added the solemn profession of vows.

Tertiary CANON, a person who had only the third part of the revenues of the canonicate.

CANON, in an ecclesiastical sense, a law, rule, or regulation of the policy and discipline of a church, made by councils either general, national, or provincial.

CANONS of the *Apostles*, a collection of ecclesiastical laws, which, though very ancient, were not left us by the apostles. It is true, they were sometimes called *apostolic canons*; but this means no more than that they were made by bishops, who lived soon after the apostles, and were called *apostolical men*. They consist of regulations, which agree with the discipline of the second and third centuries: The Greeks generally count 85; but the Latins receive only 50, nor do they observe all these.

CANON of *Mass*, in the Romish church, the name of a prayer which the priest reads low to himself, the people kneeling.

In this part of the mass, the priest particularly mentions some persons for whom he is going to offer the sacrifices, and prays to God for the redemption of their souls, the hopes of their salvation, &c.

Paschal CANON, a table of the moveable feasts, shewing the day of Easter, and the other feasts depending on it, for a cycle of 19 years.

CANON of *Scripture*, a catalogue or list of the inspired writings; or such books of the Bible as are called *canonical*, because they are in the number of those books which are looked upon as sacred, in opposition to those which either are not acknowledged as divine books, or are rejected as spurious, and are called *apocryphal*.

The canon of Scripture may be considered either as Jewish or Christian, with respect to the sacred writings acknowledged as such by the Jews, and those admitted by the Christians.

The first canon, or catalogue of the sacred books, was

was made by the Jews; but who was the author of it, is not so certain. The five books of Moses were, questionless, collected into one body within a short time after his death; since Deuteronomy, which is an abridgement of the other four, was laid in the tabernacle near the ark, according to the command he gave to the Levites: so that the first canon of the sacred writings consisted only of the five books of Moses. There were no more added to them till the division of the ten tribes; since the Samaritans acknowledged none else. However, since Moses, there were several prophets and other writers divinely inspired, who composed either the history of their own times, or prophetic books, and divine writings, or psalms to the praise of God; but it cannot be discovered that, any time before the captivity, they were collected into one body, and comprised under one and the same canon. It is evident that, in our Saviour's time, the canon of the Holy Scripture was already drawn up, since he cites the laws of Moses, the prophets, and the psalms, which are the three sorts of books of which that canon is composed, and which he often styles the *Scripture*, or the *Holy Scripture*.

It is generally received, that Ezra was the principal author of this canon, though Nehemiah had some share in it; and that he re-established, corrected, and ordered the sacred books to be written in new characters.

The Jewish canon is generally called the *canon of Ezra*: but it is certain, that all the books were not received into the canon of the Scriptures in his time; for Malachi, it is supposed, lived after him; and, in Nehemiah, mention is made of Jaddua the high priest, and of Darius Codomanus, a king of Persia, who lived at least 100 years after his time. Dr Prideaux, with great appearance of reason, says, it is most probable, that the two books of Chronicles, Ezra, Nehemiah, and Esther, as well as Malachi, were afterwards added in the time of Simeon the just; and that it was not till then that the Jewish canon of the Holy Scripture was fully completed. And, indeed, these last books seem very much to want the accuracy and skill of Ezra, in their publication; for they fall short of the exactness found in the other parts of the Hebrew Scriptures. There are some authors who pretend, that the Jews have made one or more canons; and that they have added to the former the books of Tobit, Judith, Ecclesiasticus, Wisdom, and the Maccabees: but it is most evidently true, that the Jews had no other canon but that of Ezra, nor confessed any other books for sacred but those it contains. The two assemblies of the synagogue, which, as it is pretended, were held for that purpose, are mere chimeras; nor have any ancient writers said any thing of them.

As for the Christian church, there is no doubt but it acknowledged those books to be canonical, which were cited as of divine authority, by Christ and his apostles: the ancient catalogues of the canonical books of the Old Testament, which are to be met with in Christian writers, are conformable to the canon of the Jews, and contain no other books; the Christian church, for several of the first ages, receiving the inspired writers no further than the Jewish canon. The first and most ancient catalogue of this kind, is that of Malito, bishop of Sardis, who flourished in the reign of Marcus Antoninus. It agrees with the Jewish canon,

excepting his omission of Esther, and that he makes Ruth and Judges two books. Origen has given us a list of the sacred books, in which he takes in Esther, and joins Ruth with Judges. St Gregory Nazianzen divides the books of Scripture into historical, poetical, and prophetic: he reckons 12 historical books, viz. the five books of Moses, with Joshua, Judges, Ruth, the two books of Kings, Chronicles, and Esdras. Five poetical books, Job, Daniel, and the three books of Solomon. Five prophetic books, viz. four great prophets, and 12 small ones. The council of Laodicea was the first synod in which the number of the canonical books was ascertained: this council assigns only 22 books to the Old Testament, including Esther, and joining Baruch and the Lamentations with Jeremiah. St Epiphanius reckons 27 canonical books of the Old Testament; yet he admits no more than are in the catalogue of Origen, and observes that the Jews had reduced them to 22. The third council of Carthage, in the year 397, admitted the books of Wisdom, Ecclesiasticus, Tobit, Judith, and the two books of Maccabees, into the canon. The church of Rome has agreed herein with that of Africa: for Innocent I. in his letter to Exuperius, places the same books in the canon of Scripture, as pope Gelasius, in the council held in the year 494; and the decree of pope Eugenius, and the canon of the council of Trent, agree with the canon of the council of Carthage. That the council of Trent had no prior authority to proceed on, excepting some slender pretence from the council of Carthage above mentioned, appears from the current testimony of the Latin church.

As to the canon of the New Testament, it is to be observed, that the four Evangelists, the Acts of the Apostles, all the Epistles of St Paul except that to the Hebrews, and the first Epistles of St Peter and St John, have been received as canonical by the unanimous consent of all the churches in all times: the Epistle of St James, that of St Jude, the second Epistle of St Peter, and the second and third Epistles of St John, were not received by all the churches from the beginning, as canonical; but have since been acknowledged as genuine, and therefore admitted into the canon.

We must observe, that the canon of the New Testament was neither settled by any synod, or single authority: this collection was formed upon the unanimous consent of all the churches, who, by constant tradition, reaching to the apostolical age, had received such a number of them as were written by inspired authors.

CANON, in monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them, as their local statutes.

CANON is also used for the catalogue of saints acknowledged and canonized in the Romish church.

CANON, in music. In modern music it is a kind of fugue which they call a *perpetual fugue*, because the different parts, beginning one after another, repeat incessantly the same air.

Formerly, says Zarlino, they placed, at the head of perpetual fugues, particular directions which shewed how this kind of fugues was to be sung; and these directions being properly the rules by which perpetual

fugues were composed were called *canoni*, *rules* or *canons*. From this custom, others taking the title for the thing signified, by a metonymy, termed this kind of composition *canon*. Such canons as are composed with the greatest facility, and of consequence most generally used, begin the fugue either with the octave or the unison; that is to say, that every part repeats in the same tone the melody of the preceding: in order to form a canon of this kind, it is only necessary for the composer to make an air according to his taste; to add in score as many parts as he chuses, where the voices in octave or unison repeat the same melody; then forming a single air from all these parts successively executed, to try whether this succession may form an entire piece which will give pleasure, as well in the harmony as the melody.

In order to execute such a *canon*, he who sings the first part begins alone, and continues till the air is finished; then recommences immediately, without any suspension of sound or interruption of time: as soon as he has ended the first couplet, which ought to serve for the perpetual subject upon which the whole *canon* has been composed, the second part begins and repeats the same couplet, whilst the first who had begun pursues the second: others in succession begin, and proceed the same way, as soon as he who precedes has reached the end of the first couplet. Thus, by incessantly recommencing, an universal cloze can never be found, and the *canon* may be repeated as long as the singers please.

A perpetual fugue may likewise consist of parts which begin with the intervals of a fourth or fifth; or, in other words, every part may repeat the melody of the first, a fourth or a fifth higher or lower. It is then necessary that the whole *canon* should be invented *di prima intenzione*, as the Italians say; and that sharps or flats should be added to the notes, whose natural gradations do not answer exactly, by a fourth or fifth, to the melody of the preceding part, and produce the same intervals with itself. Here the composer cannot pay the least regard to modulation; his only care is, that the melody may be the same, which renders the formation of a *canon* more difficult; for at every time when any part resumes the fugue, it takes a new key; it changes the tone almost at every note, and what is still worse, no part is at the same time found in the same tone with another; hence it is that this kind of *canons*, in other respects, far from being easy to be pursued, never produces a pleasing effect, however good the harmony may be, and however properly it may be sung.

There is a third kind of *canon*, but very scarce, as well because it is extremely difficult, as because it is for the most part incapable of giving pleasure, and can boast no other merit but the pains which have been thrown away in its composition. This may be called a *double canon inverted*, as well by the inversions which are practised in it with respect to the melody of the parts, as by those which are found among the parts themselves, in singing. There is such an artifice in this kind of *canon*, that, whether the parts be sung in their natural order, or whether the paper in which they are set be turned the contrary way, to sing them backward from the end to the beginning, in such a manner that the bass becomes the upper part, and the rest undergo a similar change, still you have pretty harmony, and still a regular *canon*. The reader may consult Rousseau's

Dictionary in this article, where he is referred to plate D fig. 11. for two examples of canons of this sort extracted from Bontempi, who likewise gives rules for their composition. But he adds, that the true principle from which this rule is deduced will be found at the word *Système*, in his account of the system of Tartini, to which we must likewise once more refer the reader; as a quotation of such length must have protracted our article to an enormous extent.

To form a *canon* in which the harmony may be a little varied, it is necessary that the parts should not follow each other in a succession too rapid, and that the one should only begin a considerable time after the other. When they follow one another so immediately as at the distance of a semibreve or a minim, the duration is not sufficient to admit a great number of chords, and the *canon* must of necessity exhibit a disagreeable monotony; but it is a method of composing, without much difficulty, a *canon* in as many parts as the composer chuses. For a *canon* of four bars only, will consist of eight parts if they follow each other at the distance of half a bar; and by each bar which is added, two parts will constantly be gained.

The emperor Charles VI. who was a great musician and composed extremely well, took much pleasure in composing and singing *canons*. Italy is still replete with most beautiful *canons* composed for this prince, by the best masters in that country. To what has been said by Rousseau, we need only subjoin, that the English *catch* and the Italian *canon* are much the same; as any intelligent reader may perceive, from comparing the structure and execution of the English *catch* with the account of *canons* which has now been given.

CANON-LAW, a collection of ecclesiastical laws, serving as the rule and measure of church-government.

The power of making laws was exercised by the church before the Roman empire became Christian. The canon-law that obtained throughout the West, till the 12th century, was the collection of canons made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes from Siricius to Anastasius.

The canon-law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws, statutes, and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon-law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and constitutions made here for the government of the church: but all these received their force from the royal assent; and if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the *act of the clergy's submission*; by which they acknowledged, that the convocation had always been assembled by the king's writ; so that though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the

Canonefs
||
Canonical.

the king's assenting to and confirming them.

The old canons continued in full force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons; which they did, and presented them to the king, who gave them the royal assent: these were a collection out of the several preceding canons and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

CANONESS, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids, without their being obliged to renounce the world or make any vows.

CANONICA, in philosophical history, an appellation given by Epicurus to his doctrine of logic. It was called *canonica*, as consisting of a few canons or rules for directing the understanding in the pursuit and knowledge of truth. Epicurus's *canonica* is represented as a very slight and insufficient logic by several of the ancients, who put a great value on his ethics and physics. Laetius even assures us, that the Epicureans rejected logic as a superfluous science; and Plutarch complains that Epicurus made an unskilful and preposterous use of syllogisms. But these censures seem too severe. Epicurus was not averse to the study of logic, but even gave better rules in this art than those philosophers who aimed at no glory but that of logics. He only seems to have rejected the dialectics of the stoics, as full of vain subtleties and deceits, and fitted rather for parade and disputation than real use. The stress of Epicurus's *canonica* consists in his doctrine of the criteria of truth. All questions in philosophy are either concerning words or things: concerning things, we seek their truth; concerning words, their signification: things are either natural or moral; and the former are either perceived by sense, or by the understanding. Hence, according to Epicurus, arise three criterions of truth, *viz.* sense, anticipation or prenotation, and passion. The great canon or principle of Epicurus's logic is, that the senses are never deceived; and therefore, that every sensation or perception of an appearance is true.

CANONICAL, something that belongs to, or partakes of the nature of, a rule or canon.

CANONICAL Obedience, is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and religious to their superiors.

CANONICAL Sins, in the ancient church, those which were capital or mortal. Such especially were idolatry, murder, adultery, heresy, and schism.

CANONICAL Punishments, are those which the church may inflict; such as excommunication, degradation, and penance, in Roman Catholic countries, also fasting, alms, whipping, &c.

CANONICAL Life, the method or rule of living prescribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were entirely distinct; but pious persons, in process of time, instituted colleges of priests and canons, where clerks brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was yet more restrained than the secular. This was called the *canonical life*, and those

Canonical
||
Canonization.

who embraced it *canons*.—Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles: others ascribe it to pope Urban I. about the year 1230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessities out of the revenues of their churches. The generality attribute it to St Augustine; who, having gathered a number of clerks to devote themselves to religion, instituted a monastery within his episcopal palace, where he lived in community with them. Onuphrius Panvinus brings the institution somewhat lower; according to him, pope Gelasius I. about the year 495, placed the first regular canons of St Augustin in the Lateran church.

CANONICAL Letters, in the ancient church, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other to keep up the catholic communion, and distinguish orthodox Christians from Arians and other heretics. They were denominated *canonical*, either as being composed according to a certain rule or form; or because they were given to the *canonici*, that is, those comprehended in the canon or catalogue of their church. When they had occasion to travel into other dioceses or countries, dimissory and recommendatory letters, also letters of peace, &c. were so many species of canonical letters.

CANONICAL is also an appellation given to those epistles in the New Testament more frequently called *catholic* or *general* epistles.

CANONIST, a person skilled in, or who makes profession of the study and practice of, the canon law. Canonists and civilians are usually combined in the same persons: And hence the title of *doctor juris utriusque*, or *legum doctor*, usually expressed in abbreviation, L.L.D. or J.U.D.

CANONIZATION, a ceremony in the Romish church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification *.

* See Beatification.

Before a beatified person is canonized, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles: which done, the holy father decrees his canonization, and appoints the day.

On the day of canonization the pope officiates in white, and their eminences are dressed in the same colour. St Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with devout impatience till the new saint has made his public entry as it were into paradise, that they may offer up their petitions to him without danger of being rejected.

The following maxim with regard to canonization is now observed, though it has not been followed above a century, *viz.* not to enter into the inquiries prior to canonization, till 50 years, at least, after the death of the person to be canonized. By the ceremony of canonization, it appears that this rite of the modern Romans has something in it very like the apotheosis or deification of the ancient Romans, and, in all probability, takes

takes its rise from it; at least several ceremonies of the same nature are conspicuous in both.

CANONRY, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without the canonicate; whereas the canonicate is inseparable from the prebend: again the rights of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

CANOPUS, in astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere. See **ASTRONOMY**, n° 206.

CANOPUS, in Pagan mythology, one of the deities of the ancient Egyptians, and, according to some, the god of water. It is said, that the Chaldeans, who worshipped fire, carried their fancied deity thro' other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver, and gold, its priests declared, that all gods did it homage. This the priests of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopp'd with wax, and having filled the vessel with water, painted it of several colours, and sitting the head of an idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water gushed out thro' the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

CANOPUS, or *Canobus*, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called *Canopus*, near one of the mouths of the Nile. Dionysius mentions it:

Καὶ πλοῖον ἐπὶ τῷ Ἀμύκλῳ Ἀρκυκλῷ οἷοι Κανόβῳ.
There stands Canobus' temple known to fame;
The pilot who from fair Amycla came.

Vossius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named *Canopus*, took from thence an opportunity of deifying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek: F. Monfaucou gives several representations of this deity. Once, in allusion to the victory abovementioned, throws out water on every side through little holes.

CANSO, a sea-port town of Acadia, or Nova Scotia, in North America, seated on a narrow strait which separates Nova Scotia from Cape Breton. Near this town is a fine fishery for cod. W. Long. 62. N. Lat. 46.

CANSTAT, a town of Swabia, in Germany, in the duchy of Wirtemberg, situated on the river Neckar, in E. Long. 9. 9. N. Lat. 48. 51.

CANT, a quaint affected manner of speaking, adapted chiefly to the lower sort. Skinner racks his invention for the origin of this word; which he successively deduces from the German, Flemish, and Saxon tongues. According to the general opinion, Cant is originally the proper name of a Cameronian preacher in Scotland, who by exercise had obtained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation: since

Andrew Cant's time, the word has been extended to signify all sudden exclamations, and whining unmusical tones, especially in praying and preaching. But this origin of the word has been disputed by others; and perhaps the true derivation is from the Latin *cantare* "to sing."

CANT is also applied to words and phrases affected by particular persons or professions for low ends, and not authorised by the established language *. The difference between *cant* and *technical* seems to be this: the former is restrained to words introduced out of folly, affectation, or imposture; the latter is applied to such as are introduced for the sake of clearness, precision, and significancy.

CANT-TIMBERS, in ship-building, those timbers which are situated at the two ends of a ship. They derive their name from being *canted*, or raised obliquely from the keel; in contradistinction from those whose planes are perpendicular to it. The upper ends of those on the *bow*, or fore-part of the ship, are inclined to the stern; as those in the *after*, or hind part, incline to the stern-post above. See **SHIP-BUILDING**.

CANTABRIA, (anc. geog.), a district of Terraconensis, on the Oceanus Cantabricus or bay of Biscay; now **BISCAY**. The inhabitants were famous for their warlike character. In conjunction with the Asturians *, they carried on desperate wars with the Romans; but were subdued by them, about 25 years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations: but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garriisons with incredible fury.

Agrippa marched against them with great expedition; but, on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed, routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrippa afterwards owned, that he had never, either by sea or land, been engaged in a more dangerous enterprise. That brave commander was obliged to use in-treaties, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that, after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces; their castles and strong holds taken and rased; and their women, children, and old men, (none else being left alive), were obliged to abandon the mountainous places, and settle in the plain.

CANTABRICA, in botany, a synonyme of a species of *CONVOLVULUS*.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some words or motto of good omen, to encourage the soldiers.

CANTACUZENUS (Johannes), of Constantinople, a celebrated statesman, general, and historian, was born in that city, of a very ancient and noble family. He was bred to letters and to arms, and admitted to the highest offices of the state. The emperor Andronicus loaded him with wealth and honour; made him generalissimo of his forces; and was desirous of having him join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till his son John Palologus, who was then but nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empress dowager and her faction forming a party against him, declared him a traitor. On this the principal nobility and the army besought him to ascend the throne; and accordingly he was crowned on the 21st of May, 1342. This was followed by a civil war, which lasted five years; when he admitted John a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicions and enmities, however, soon arising, the war broke out again, and continued till John took Constantinople, in 1355. A few days after, Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire, and retiring to a monastery, took the habit of a monk, and the name of *Josaphas*. His wife also retired to a nunnery, and changed her name of *Irene* for that of *Eugenia*. In this retirement he lived till the year 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek manuscript, was published by Pontanus at Ingolstadt, in 1603; and a splendid edition was printed at Paris, in 1645, in three volumes folio, of the original Greek, and Pontanus's Latin version. He also wrote an Apology for the Christian religion against that of Mahomet, under the name of *Christodulus*.

CANTALIVERS, in architecture, pieces of wood framed into the front or sides of a house, to suspend the mouldings and eyes over it.

CANTAR, or **CANTARO**, in commerce, a weight used in Italy, particularly in Leghorn, to weigh some sorts of merchandises.—There are three sorts of cantari, or quintals; one weighs 150 pounds, another 151, and the third 160: the first serves to weigh alum and cheese; the second is for sugar, and the third for wool and cod-fish.

CANTAR is also a measure of capacity used at Cochin, and containing four rubis.

CANTARINI (Simon), a famous painter, called the *Pesarese*, from his being born at Pesaro, was the disciple of Guido; and copied the manner of his master so happily, that it is often difficult to distinguish between their works. He died at Verona in 1648.

CANTATA, in music, a song or composition, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough base, though sometimes for other instruments.

The cantata, when performed with judgment, has something in it very agreeable; the variety of the movement not clogging the ear, like other compositions. It was first used in Italy, then in France, whence it passed to us.

CANTAZARO, an episcopal city of Italy, in the kingdom of Naples, and in the territory of Calabria Ulterior. It is the residence of the governor of the province, and is seated near the sea, in E. Long. 17. 0. N. Lat. 38. 50.

CANTECROIX, a small territory of the Netherlands, in Brabant, and in the quarter of Antwerp, with the title of a principality; there is a small town of the same name, but Lirc is the capital.

CANTEMIR (Demetrius), son of a prince of Moldavia. Disappointed by not succeeding his father in that dignity, held under the Ottoman Port, he went over with his army to the Czar Peter the great, against whom he had been sent by the Grand Signior: he signalized himself in the Czar's service; and in the republic of letters, by a Latin history of the origin and decline of the Ottoman empire, &c. Died in 1723.

CANTEMIR (Antiochus), esteemed the founder of the Russian poetry, was the youngest son of the preceding. Under the most ingenious professors, whom the czar had invited to Petersburg, he learned mathematics, physics, history, moral philosophy, and polite literature; without neglecting the study of the Holy Scriptures, to which he had a great inclination. Scarce had he finished his academic course, when he printed a Concordance to the Psalms in the Russian language, and was elected member of the academy. The affairs of state, in which he was soon after engaged, did not make him neglect his literary pursuits. In order to make himself useful to his fellow-citizens, he composed his satires, to ridicule certain prejudices which had got footing among them. When but 23 years of age, he was nominated minister at the court of Great Britain; and his dexterity in the management of public affairs was as much admired, as his taste for the sciences. He had the same reputation in France, whither he went in 1738, in quality of minister plenipotentiary, and soon after was invested with the character of ambassador extraordinary. The wife and prudent manner in which he conducted himself during the different revolutions which happened in Russia during his absence, gained him the confidence and esteem of three successful princes. He died of a dropy, at Paris, in 1744, aged 44. Besides the pieces already mentioned, he wrote, 1. Some fables and odes. 2. A translation of Horace's epistles into Russian verse. 3. A prose translation of Fontenelle's plurality of worlds; and, 4. Algarotti's dialogues on light. The abbe Guasco has written his life in French, and translated his satires into that language.

CANTERBURY, a city of England, and capital of the county of Kent, situated in E. Long. 1. 15. N. Lat. 51. 16. It had the names of *Durovernum* and *Durobernium* given it by the Romans, and *Durobernia* by Bede, which are thought to be derived from *Durnubem*, signifying a rapid stream, such as the Stour, on which it stands, is. The Britons called it *Caer-Kent*, i. e. the city of Kent; and its present English name is of the same import, derived from the Saxon. Modern writers in Latin call it *Cantuarina*. Its great antiquity appears not only from Antoninus's itinerary, but from

Canthbury, from the military way which has been discovered here, and the causeways leading to Dover and Lymme, besides the coins and other curiosities found about it. The archiepiscopal and metropolitical dignity seems to have been settled here very early, about the beginning of the ninth century, if not sooner; and to prevent its being removed, an anathema was decreed against any who should attempt. After that, the city flourished greatly; though it suffered in common with other towns during the Danish invasions, and at other times by the casualties of fire. The city was given intirely to the bishops by William Rufus, and was held in the utmost veneration in the Popish times, especially after the murder of Becket in the reign of Henry II. to whose shrine so great was the resort, and so rich were the offerings, that Erasmus, who was an eye-witness of its wealth, says the whole church and chapel in which he was interred glittered with jewels; and at the dissolution, the plate and jewels filled two great chests, each of which required eight strong men to carry out. The cathedral was granted by Ethelbert, king of Kent, upon his conversion, to Austin the monk, together with his palace, and the royalty of the city and its territories. This Austin founded a monastery for monks, called from him *Augustin*. After the cathedral had been several times destroyed by fire and rebuilt, the present was begun about the year 1174, and augmented and embellished by the succeeding archbishops, till it was completed in the reign of Henry V. It is a noble Gothic pile, and before the reformation had 37 altars. A great many kings, princes, cardinals, and archbishops, are buried in it. At the dissolution, Henry VIII. seized all the revenues both of the church and monastery, except what he allotted for the maintenance of a dean, 12 prebendaries, and six preachers, whom he established in place of the monks. Besides the cathedral and other churches, as well as a monastery, the city had anciently a castle on the south-side, and strong walls, with towers, a ditch, and rampart; it had also a mint and an exchange. As to its government, it seems to have been entirely subject to the archbishop, both in spirituals and temporals; at least from the time that William Rufus gave it solely to bishop Anselm, till the reformation. It is now a county of itself; and the corporation consists of a mayor, recorder, 12 aldermen, a sheriff, 24 common-council-men, a mace-bearer, sword-bearer, and 20 or serjeants at mace. Every Monday a court is held at Guildhall for civil and criminal causes; and every other Tuesday for the government of the city. With respect to its present condition, here are at present no less than 2000 or 3000 French Protestants employed in the silk manufacture. Besides the cathedral, it contains 15 parish-churches, seven hospitals, a free-school, a house of correction, a gaol for criminals, and a sumptuous conduit for supplying the inhabitants with water. It consists of four streets, disposed in the form of a cross, and divided into six wards, which are about three miles in circumference. It is surrounded on all hands with hop-grounds much to its advantage, and is famed for its excellent brawn.

CANTERBURY-Bell, in botany, the English name of a species of *CAMPANULA*.

CANTERUS (William), an eminent linguist and philologist, was born at Utrecht, in 1542. He studied

at Louvain and Paris; and gave surprising proofs of his progress in Greek and Latin literature. He afterwards visited the several universities of Germany and Italy; and died at Louvain, in 1575, aged 33. He understood six languages, besides that of his native country; and, notwithstanding his dying so young, wrote several philological and critical works, among which are, *Notæ, Scholia, Emendationes, et Explicationes, in Euripidem, Sophoclem, Æschylum, Ciceronem, Propertium, Ausonium, &c.* and many translations of Greek authors.

CANTHARIDES. See CANTHARIS and MELOE.

CANTHARIS, in zoology, a genus of insects belonging to the order of insecta coleoptera. The feelers of this genus are fetaceous; the breast is margined, and shorter than the head; the elytra, or wing-cases, are flexible; and the sides of the belly are plated and papillous. Linnæus enumerates 27 species of the cantharis, most of them to be found in different parts of Europe. The cantharis used in making blistering plaisters, is ranked under a different genus, viz. the MELOE.

CANTHI, in anatomy, cavities at the extremities of the eye-lids, commonly called the *corners of the eye*: the greater of them, or the greater canthus, is next the nose; the lesser of them, or the little canthus, lies towards the temple.

CANTICLES, a canonical book of the Old Testament, otherwise called the *Song of Solomon*; by the Jews the *Song of songs, Canticum canticorum*. The book of Canticles is usually supposed to be an epithalamium composed by Solomon, on occasion of his marriage with the king of Egypt's daughter. But those who penetrate further into the mystery, find in it the marriage of Jesus Christ with human nature, the church, and good men. On this principle the Canticles is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and spiritual marriage is expressed. This song contains the adventures of seven days and seven nights; the exact time allowed for the celebration of marriage among the Hebrews. The Jews themselves, apprehending the book liable to be understood in a gross and carnal manner, prudently prohibited the reading of it before the age of 30, and the same usage anciently obtained in the Christian church. Among the ancients, Theodore Mopsuetanus rejected the book of Canticles as not divine. Divers rabbins have also questioned its being written by inspiration. The Anabaptists generally lay it aside as a dangerous composition. It is alleged, that the name of God is not once found in it. Mr Whiston has a discourse expressly to prove, that the Canticles is not a sacred book of the Old Testament. He alleges it indeed to have been written by king Solomon the son of David; but asserts that it was composed at the time when that prince, blinded by his concubines, was sunk in lust and idolatry. This he chiefly infers from the general character of vanity and dissoluteness which reigns thro' the Canticles; in which there is not, according to Whiston, one thought that leads the mind towards religion, but all is worldly and carnal, to say no worse. For the mystic sense, he asserts it to be without foundation; and that the book is not cited as canonical by any writer before the destruction of Jerusalem. Mr Whiston will have it to have been taken into the canon between the years 77 and 128, when allegories came into vogue, and

and the rabbins began to corrupt the text of Scripture. Grotius, Nierembergius, the Dutch divines who criticised F. Simon, Menetrier, Bafnage, and some others, seem also to take the Canticles for a profane composition, on a footing with the love-pieces of Catullus or Ovid. But this opinion is refuted by Michaelis, Majus, Witfius, Nat. Alexander, Outrein, Francius, and others. Mr Whiffon's arguments have been particularly considered by Itchenor. R. Akiba finds the book of Canticles more divine than the rest: the whole world, according to this rabbin, is not worth that day when the Canticles was given to Israel; for, whereas all the hagiographers are holy, the Canticles is the holy of holies.

CANTIN (Cape), a promontory of the coast of Morocco in Africa, situated in W. Long. 10. 2. N. Lat. 33. 9.

CANTING, a sea-phrase, denotes the act of turning any thing about.

CANTING *Language or dialect*, is a mysterious sort of jargon used by gypsies, thieves, and strolling beggars, to express their sentiments to each other, without being understood by the rest of mankind. This dialect is not founded on any rules: yet, even out of that irregularity, many words seem to retain something of scholarship; as *togeman* a gown, from *toga* in the Latin; *pannam*, bread, from *panis*; *casan*, cheese, from *caseus*, &c. It is observable, that, even unknown to ourselves, we have adopted some of their turns into our vulgar language; as *bite and bilk*, to cheat; *bounce*, to vapour; *bowse*, strong drink; *fitch*, to steal; *flog*, to whip; *rig*, game or ridicule; *roaf*, to rally; *rhino*, money. From the same source proceed the words *sham*, *banter*, *bubble*, *bully*, *sharpers*, *cutting*, *shuffling*, *palming*, &c. An anonymous author has given a canting dictionary, comprehending all the terms used by the several tribes of gypsies, beggars, shoplifters, highwaymen, footpads, and other clans of cheats and villains, with a collection of songs in the canting dialect; London, 1725, 8vo.

CANTIUM, (anc. geog.) a promontory of Britain, literally denoting a head-land, giving name to a territory called *Cantium*, now *Kent*. The promontory is now called the *North Foreland*.

CANTO denotes a part or division of a poem, answering to what is otherwise called a *book*. The word is Italian, where it properly signifies *song*. Tasso, Ariosto, and several other Italians, have divided their longer or heroic poems into cantos. In imitation of them, Scarron has also divided his *Gigantomachia*, and Boileau his *Lutrin*, into chants or songs. The like usage has been adopted by some English writers, as Butler, who divides his *Hudibras*, and Dr Garth his *Dispensary*, into cantos. A late translator of part of Virgil's *Æneid* has even subdivided a book of Virgil into several cantos.

CANTO, in the Italian music, signifies a *song*: hence *canto semplice* is where all the notes or figures are equal, and called also *canto fermo*; *canto figurato*, that where the figures are unequal, and express different motions.

CANTO also signifies the treble part of a song: hence *canto concertante*, the treble of the little chorus; *canto ripieno*, the treble of the grand chorus, or that which sings only now and then in particular places. *Canto* signifies the first treble, unless some other word be

added to it, as *secondo*, in which case it denotes the second treble.

CANTON, in geography, denotes a small district or country constituting a distinct government: such are the cantons of Switzerland.

CANTON, or *Quang-tong*, a province of the empire of China in Asia. It is bounded on the north by Kyang-fi; on the north-east, by Fokeyn; on the west, by Quang-fi and the kingdom of Tonquin; and the rest is washed by Nan-hay, or the sea of the south. This province is reckoned the most considerable in China, not only on account of its extent, but also because of its vast commerce, opulence, advantageous situation, and great number of its ports. Its inhabitants are computed to amount to 383,360 families, or 1,998,029 men. The soil is so fertile, that it produces two crops of corn yearly; and in the like plenty all sorts of grain, fruits, and vegetables, with every thing that can contribute to the pleasures of life. The climate is warm, but clear; and the people are stout and healthy. The commodities of this province are of the most valuable kind; such as diamonds, and precious stones of all sorts; pearls, gold, silver, and other metals, curiously wrought for various uses. Silks, cottons, and linens of all kinds, are also manufactured and exported in great quantities, as well as china-ware and japan-work; in which such multitudes are employed, that, notwithstanding the fertility of the province, it doth not produce a sufficient quantity of provisions for its inhabitants, but is assisted by some of the neighbouring ones. They use here the same way of hatching eggs in ovens and dunghills that they do in Egypt. The eggs of ducks, which are in great plenty, are particularly used in this manner: they have also a method of preserving them fresh all the year round by covering them with a sort of paste. We are told of a curious singularity of the ducks and chickens so hatched; viz. that the owners carry them in boats to the sea-side, at low water, where they feed on such insects as they can find; but though the doves are thus naturally intermixed, no sooner does the owner strike on a balon, as a signal to return, than each dove returns to its own boat, as pigeons do to their holes. The governor or viceroy of Canton is also governor of Quang-fi; for which reason he commonly resides at Chau-king, to communicate his orders to both provinces with the greater facility. He keeps a great number of soldiers, to suppress highwaymen and pirates, which are very troublesome. For the same end there are a great number of fortresses both on the sea-coasts and inland, most of them like large cities, very strong, and well garrisoned, besides inferior ones dispersed in proper places. This province is divided into ten capital jurisdictions; Canton or Quanchew the chief, Shauchew, Nan-yong, Whechow, Chau-chew, Chau-king, Kau-chew, Lyen-chew, Lwy-chew, and Kyun-chew; which last is the capital of the island of Haynan.

CANTON, a large, populous, and wealthy maritime city of China, capital of the province of that name. It is seated on the mouth of the river *Ta-ho* or great river, which is here very wide and spacious, and forms the bay called *Humen*, or tyger's gate, though it hath nothing terrible in it except a few forts built to keep off the pirates. The city is very large; being reckoned, with its suburbs, upwards of 20 miles in compass. It

Cantoning
↓
Canute.

Canute.

may be properly said to consist of three cities, each of them surrounded with strong and lofty walls, yet so as to have a communication with each other by stately gates, which are only shut up at night. The streets are long and straight, paved with flag-stones, and adorned with several triumphal arches. There are also bazars or covered market-places full of shops. The houses are only a ground-floor built with earth, and covered with tiles; however, the shops give it a very neat look. The better sort of people are carried about in chairs; but the common people walk bare-footed and bare-headed; and their goods are carried by porters, for they have no waggons. At the end of every street is a barrier which is shut in the evening, as well as the gates of the city, so that people are obliged to be at home early. The number of inhabitants is computed at 1,000,000. E. Long. 112. 27. N. Lat. 25. 20.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment; the town where they are quartered being divided into as many cantons as there are regiments.

CANTRED, or CANTREE, signifies an hundred villages. It is a British word, compounded of the adjective *cant*, i. e. hundred; and *tres*, a town or village. In Wales some of the counties are divided into cantreds, as in England into hundreds.

CANTYRE. See KINTYRE.

CANTZ, a town of Silesia in Germany. E. Long. 16. 36. N. Lat. 51. 6.

CANVAS, in commerce, a very clear unbleached cloth of hemp, or flax, wove regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares.

CANVAS is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover womens stays, also to stiffen mens clothes, and to make some other of their wearing-apparel, &c.

CANVAS is used among the French for the model and first words, where an air or piece of music is composed, and given to a poet to regulate and finish.

CANVAS is also a name sometimes given to sail-cloth.

CANVAS, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a slick-stone, then sized, and afterwards whited over, makes what the painters call their *primed cloth*, on which they draw their first sketches with coal or chalk, and afterwards finish with colours.

CANUTE, the first Danish king of England after Ironside. He married Emma widow of king Ethelred; and put to death several persons of quality who stood in his way to the crown. Having thus settled his power in England, he made a voyage to his other kingdom of Denmark, in order to resist the attacks of the king of Sweden; and he carried along with him a great body of the English under the command of the earl of Godwin. This nobleman had here an opportunity of performing a service by which he both reconciled the king's mind to the English nation, and, gaining to himself the friendship of his sovereign, laid the foundation of that immense fortune which he acquired to his family. He was stationed next the Swedish camp; and, observing a favourable opportunity which he was obliged suddenly to seize, he attacked the enemy in the

night, drove them suddenly from their trenches, threw them into disorder, pursued his advantage, and obtained a decisive victory over them. Next morning, Canute, seeing the English camp entirely abandoned, imagined that these disaffected troops had deserted to the enemy; and he was agreeably surprised to find that they were at that time engaged in pursuit of the discomfited Swedes. He was so pleased with this success, and the manner of obtaining it, that he bestowed his daughter in marriage upon Godwin, and treated him ever after with the most entire confidence and regard.

In another voyage which he afterwards made to Denmark, Canute attacked Norway, and expelled the just but unwarlike Olaus from his kingdom, of which he kept possession till the death of that prince. He had now by his conquests and valour attained the utmost height of his ambition; and having leisure from wars and intrigues, he felt the unsatisfactory nature of all human enjoyments; and, equally weary of the glory and turmoils of this life, he began to cast his view towards that future existence which it is so natural for the human mind, whether satiated by prosperity or disgusted with adversity, to make the object of its attention. Unfortunately the spirit which prevailed in that age gave a wrong direction to his devotion; and, instead of making atonement to those whom he had formerly injured by his acts of violence, he entirely employed himself in those exercises of piety which the monks represented as most meritorious. He built churches; he endowed monasteries; he enriched ecclesiastics; and he bestowed revenues for the support of chantries at Apsington and other places, where he appointed prayers to be said for the souls of those who had there fallen in battle against him. He even undertook a pilgrimage to Rome, where he sojourned a considerable time; and, besides obtaining from the Pope some privileges for the English school erected there, he engaged all the princes through whose dominions he was obliged to pass, to desist from those heavy impositions and tolls which they were accustomed to exact from the English pilgrims. By this spirit of devotion, no less than by his equitable and politic administration, he gained in a good measure the affections of his subjects.

Canute, who was the greatest and most powerful prince of his time, sovereign of Denmark and Norway as well as of England, could not fail to meet with adulation from his courtiers; a tribute which is liberally paid even to the meanest and weakest of princes. Some of his flatterers breaking out one day in admiration of his grandeur, exclaimed, that every thing was possible for him: upon which, the monarch, it is said, ordered his chair to be set on the sea-shore while the tide was making; and, as the waters approached, he commanded them to retire, and to obey the voice of him who was lord of the ocean. He feigned to sit some time in expectation of their submission; but when the sea still advanced towards him, and began to wash him with its billows, he turned to his courtiers, and remarked to them, That every creature in the universe was feeble and impotent, and that power resided with one Being alone, in whose hands were all the elements of nature, who could say to the ocean, "Thus far shalt thou go, and no farther," and who could level with his nod the most towering piles of human pride and ambition. From that time, it is said, he never would wear a crown.

He

Canzone
 Caoutchouc.

He died in the 20th year of his reign; and was interred at Winchester, in the old monastery.

CANZONE, in music, signifies, in general, a song where some little fugues are introduced: but it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata: if placed in any part of a sonata, it implies the same meaning as *allegro*, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CANZONETTA, a diminutive of canzone, denoting a little short song. The canzonette neapolitane has two strains, each whereof is sung twice over, as the vaudevilles of the French: the canzonette siciliane is a species of jig, the measure whereof is usually twelve eighths, and six eighths, and sometimes both, as rondeaux.

CAORLO, a small island in the gulf of Venice, on the coast of Friuli, 20 miles south-west of Aquileia, subject to Venice. It has a town of the same name, with a bishop's see.

CAOUTCHOUC, or ΚΑΟΥΤΧΟΥΚ, a resin found in different parts of Asia and South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is farther a matter of curiosity as being capable of resisting the action of very powerful menstrua. From the account of M. de la Condaminé, we learn, that this substance oozes out, under the form of a vegetable milk, from incisions made in a certain species of tree in the country in which it is found. This liquor gradually dries, and is formed into a substance of the appearance of leather, which is in a very high degree pliable and elastic, while at the same time it possesses a considerable degree of solidity. On account of these properties, the Omaguas, a numerous nation on the banks of the river of the Amazons, employ this resin, while yet in the state of milk, for making several utensils, as goblets, bottles, and the like. As the same properties would render it of singular utility for many other purposes in arts, philosophers have long endeavoured to discover some method of dissolving it in such a manner, that it would assume different figures with equal ease as when in its original state of milk. In the memoirs of the academy of Sciences for 1768 we have an account of several attempts for this purpose, and how it may be effected.—The state of vegetable milk in which the caoutchouc resin is found when it comes from the tree, led Mr Macquer to imagine that it was composed of an oil and a watery matter. From its wanting aromatic flavour, from its little volatility, and from its being incapable of solution in spirit of wine, he concluded that the oil which entered its composition was not an essential, but a fatty, one. Hence he thought it probable that it passed from a fluid to a solid form by the evaporation of the watery part, and that the oily solvents would reduce it to a soft state. The first trials he made for dissolving it were with linseed oil, essence of turpentine, and several others. But all he could obtain by means of these menstrua was a viscid substance incapable of being hardened, and totally void of elasticity. The rectified essential oil of turpentine was employed seemingly with greater success. To separate from

Caoutchouc.
 Cap.

this menstruum the caoutchouc which it had dissolved, Mr Macquer added spirit of wine: but the consequence was, that part only of the oil united with the spirit; the rest remaining obstinately attached to the resin which it had dissolved, and thus preventing it from assuming a solid consistence. The author next endeavoured to dissolve it by means of heat in Papin's digester. But neither water, nor spirit of wine, although in this way capable of dissolving the hardest bones, could produce any other effect upon it than to render it more firm than before. After this, he tried what effect the milky juice of other vegetables would have upon it. He used several kinds, particularly that of the fig. But, in this way, he could obtain no solution. From the great volatility of ether, he was next induced to try it as a menstruum; and, for this purpose, he prepared some with great attention. The caoutchouc, cut into little bits, and put into a proper vessel with as much ether as was sufficient to cover it, was perfectly dissolved without any other heat than that of the atmosphere. This solution was transparent, and of an amber colour. It still preserved the smell of ether, but mixed with the disagreeable odour of the caoutchouc, and it was a little less fluid than pure ether. Upon its being thrown into water, no milky liquor was produced; but there arose to the surface a solid membrane which possessed the great elasticity and other peculiar properties of the caoutchouc.

The Indian method of forming bottles, goblets, &c. of the caoutchouc is, by making moulds of clay, which they cover with thin layers of the caoutchouc, taking care never to lay on a fresh one till the former is dry. After it has acquired the proper thickness, by an instrument fitted for that purpose, they take out the clay. The same process may be followed in forming vessels of the caoutchouc dissolved in ether. But in forming small vessels, Mr Macquer did not employ moulds made of clay, but of wax, which were easily removed, by throwing the vessel after it was formed into boiling water.

Of this gum, it is said, the Chinese make elastic rings for lascivious purposes.—Among us, it is used by surgeons for injecting liquids, and by painters for rubbing out black-lead pencil marks.

CAP, a part of dress made to cover the head, much in the figure thereof.

The use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of the hoods, or chaperons, that had been used till then. When the cap was of velvet, they called it *mortier*; when of wool, simply *bonnet*. None but kings, princes, and knights, were allowed the use of the mortar. The cap was the head-dress of the clergy and graduates: Churchmen and members of universities, students in law, physic, &c. as well as graduates, wear square caps in most universities. Doctors are distinguished by peculiar caps, given them in assuming the doctorate. Pasquier says, that the giving the cap to students in the universities, was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors, in imitation of the ancient Romans, who gave a pilus or cap to their slaves, in the ceremony of making them free. The cap is also used as a mark

Cap
Caperolans.

of infamy in Italy. The Jews are distinguished by a yellow cap at Lucca, and by an orange one in France.

CAP of Maintenance, one of the regalia, or ornaments of state belonging to the kings of England, before whom it was carried at the coronation and other great solemnities. Caps of maintenance are also carried before the mayors of the several cities in England.

CAP, in ship-building, a strong, thick, block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is for this purpose furnished with two holes perpendicular to its length and breadth, and parallel to its thickness: one of these is square, and the other round; the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position.

CAPACIO, an episcopal town of Italy, in the kingdom of Naples, and in the hither Principato. E. Long. 15. 18. N. Lat. 40. 40.

CAPACITY, in a general sense, an aptitude or disposition to hold or retain any thing.

CAPACITY, in geometry, is the solid contents of any body; also our hollow measure for wine, beer, corn, salt, &c. are called *measures of capacity*.

CAPACITY, in law, the ability of a man, or body politic, to give or take lands or other things, or sue actions.

Our law allows the king two capacities; a natural, and a political: in the first, he may purchase lands to him and his heirs; in the second, to him and his successors. The clergy of the church of England have the like.

CAPE, in geography, an high land running out with a point, into the sea, as Cape-Nord, Cape-Horn, the Cape of Good-Hope, &c.

CAPE Breton. See BRETON.

CAPE Coast Castle. See COAST.

CAPE of Good-Hope. See GOOD-HOPE.

CAPE Verd. See VERD.

CAPELLA, in astronomy, a bright fixed star in the left shoulder of the constellation auriga.

CAPELLAS (Lewis), an eminent French Protestant divine, born at Sedan in Champagne about the year 1579. He was author of some learned works; but is chiefly known from the controversy he engaged in with the younger Buxtorf concerning the antiquity of Hebrew points, which Capellas undertook to disprove. His *Critica Sacra* was also an elaborate work, and excited some disputes: he died in 1658, having made an abridgement of his life in his work *De gente Capellori*.

CAPELLE, a town of France, in Picardy, and in the Tierache, eight miles from Guise. It was taken by the Spaniards in 1636; but retaken the year after. E. Long. 3. 59. N. Lat. 49. 58.

CAPELLETS, in farristry. See there, § xxxvi. 4.

CAPER, in botany. See CAPPARIS.

CAPEROLANS, a congregation of religious in Italy, so called from Peter Caperole their founder, in the 15th century.

The Milanese and Venetians being at war, the enmity occasioned thereby spread itself to the very cloysters. The superiors of the province of Milan, of minor brothers, which extended itself as far as the territories of the republic of Venice, carried it so haugh-

tily over the Venetians, that those of the convent of Brescia resolved to shake off a yoke which was grown insupportable to them. The superiors, informed of this, expelled out of the province those whom they considered as the authors of this design; the principal of whom were Peter Caperole, Mathew de Tharvillo, and Bonaventure of Brescia. Peter Caperole, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan, and subject them to the conventuals.

This occasioned a law-suit between the vicar-general and these convents, which was determined in favour of the latter; and these convents, in 1475, by the authority of Pope Sixtus IV. were erected into a distinct vicariate, under the title of that of *Brescia*. This not satisfying the ambition of Caperole, he obtained, by the interposition of the Doge of Venice, that this vicariate might be erected into a congregation, which was called from him *Caperolans*. This congregation still subsists in Italy, and is composed of 24 convents, situated in Brescia, Bergamo, and Cremona.

CAPERQUIN, a town of Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater. W. Long. 7. 50. N. Lat. 52. 5.

CAPESTAN, a town of France, in Lower Languedoc, in the diocese of Narbonne, and near the royal canal. E. Long. 3. 5. N. Lat. 43. 35.

CAPHAR, a duty which the Turks raise on the Christians, who carry or send merchandises from Aleppo to Jerusalem and other places in Syria.

This duty of caphar was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favouring their excursions and plunders.

CAP-AGA, or *CAPOU-Agassi*, a Turkish officer, who is, as it were, grand master of the seraglio. He is the first in dignity and repute of all the white eunuchs, and is always near the Grand Signior's person. It is he who introduces ambassadors to audience, and all the great affairs pass through his hand before they come to that of the prince.

CAPIAS, in law, a writ of two sorts; one before judgment in an action, and the other after. That before judgment is called *capias ad respondendum*, where an original is issued out, to take the defendant, and make him answer the plaintiff. That after judgment is of divers kinds; as,

CAPIAS ad Satisfaciendum, a writ of execution that issues on a judgment obtained, and lies where any person recovers in a personal action, as for debt, damages, &c. in which cases this writ issues to the sheriff commanding him to take the body of him against whom the debt is recovered, who is to be kept in prison till he make satisfaction.

CAPIAS pro Fine is a writ lying where a person is fined to the king, for some offence committed against a statute, and he does not discharge the fine according to the judgment; therefore his body shall be taken by this writ, and committed to goal till the fine is paid.

CAPIAS Ullegatum, a writ which lies against any one out-

Caperquin
Capias.

Capias
Capillary.

outlawed, upon any action personal or criminal, by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of return, when he is ordered to present him to the court, to be there farther ordered for his contempt.

CAPIAS in Withernam, a writ that lies for cattle in *withernam*: that is, where a distrefs taken is driven out of the county, so that the sheriff cannot make deliverance upon a replevin; then this writ issues, commanding the sheriff to take as many beasts of the distraiter, &c.

CAPIGI, in the Turkish affairs, the name of certain inferior officers belonging to the seraglio, to the number of 500, whose business it is to assist the janizaries in guarding the first and second gate of that palace; whence also the name *Capigi*, which signifies a gate.

CAPILLAMENT, in a general sense, signifies a hair; when the word is applied to several things, which on account of their length or their fineness resemble hairs: as,

CAPILLMENTS of the Nerve, in anatomy, the fine fibres or filaments whereof the nerves are composed.

CAPILLARY, in a general sense, an appellation given to things on account of their extreme fineness, or resembling hair.

CAPILLARY Tubes, in physics, are small pipes of glass, whose canals are extremely narrow, their diameter being only a half, a third, or a fourth of a line.

The ascent of water, &c. in capillary tubes, is a phenomenon that has long embarrassed the philosophers: for let one end of a glass tube open at both extremities, be immersed in water, the liquor within the tube will rise to a considerable height above the external surface: or if two or more tubes are immersed in the same fluid, one a capillary tube, and the other of a larger bore, the fluid will ascend higher in the former than in the latter; and this will be in a reciprocal ratio of the diameters of the tubes.

In order to account for this phenomenon, it will be necessary first to premise, that the attraction between the particles of glass and water is greater than the attraction between the particles of water themselves: for if a glass tube be placed in a position parallel to the horizon, and a drop of water be applied to the under side of the tube, it will adhere to it; nor will it fall from the glass till its bulk and gravity are so far increased, as to overcome the attraction of the glass. Hence it is easy to conceive how sensibly such a power must act on the surface of a fluid, not viscid, as water, contained within the small cavity or bore of a glass-tube; as also that it will be proportionably stronger as the diameter of the bore is smaller; for it will be evident that the efficacy of the power is in the inverse proportion of the diameter, when it is considered, that such particles only as are in contact with the fluid, and those immediately above the surface, can effect it.

Now these particles form a periphery contiguous to the surface, the upper part of which attracts and raises the surface, while the lower part, which is in contact with it, supports it: so that neither the thickness nor length of the tube is of any consequence here; the periphery of particles only, which is always proportionable to the diameter of the bore, is the only acting power. The quantity of the fluid raised will therefore be as the

surface of the bore which it fills, that is, as the diameter; for otherwise the effect would not be proportional to the cause, since the quantities are always as the ratio of the diameters; the heights therefore to which the fluids will rise, in different tubes, will be inversely as the diameters.

Some doubt whether the law holds throughout, of the ascent of the fluid being always higher as the tube is smaller; Dr Hook's experiments, with tubes almost as fine as cobwebs, seem to shew the contrary. The water in these, he observes, did not rise so high as one would have expected. The highest he ever found it, was at 21 inches above the level of the water in the basin; which is much short of what it ought to have been by the law abovementioned. See *COHESION*.

CAPILLARY Vessels. Many small vessels of animal bodies have been discovered by the modern invention of injecting the vessels of animals with a colouring fluid which upon cooling grows hard. But though most anatomists know the manner of filling the large trunks, few are acquainted with the art of filling the capillaries. Dr Monro has given what he after many trials has found most successful *. See *INJECTION*.

CAPILLUS VENERIS. See *ADIANTHUM*.

CAPILUPI, or *CAPILUPUS*, (*Camillus*), a native of Mantua in the 16th century. He wrote a book intitled *The Stratagem*; in which he relates not only what was perpetrated at Paris during the massacre on St Bartholomew's day, but also the artful preparations which preceded that horrid massacre. It is, however, blended with a great number of futilities.

CAPILUPI (*Lælius*), an Italian poet brother to the former, made himself famous by some Centos of Virgil. The manner in which he applied Virgil's expressions to represent things which the poet never dreamt of, is admired. His Cento against women is very ingenious, but too fatirical. The poems of Capilupi are inserted in the *Delicie Poetarum Italorum*.

CAPITA, (distribution by), in law, signifies the appointing to every man an equal share of a personal estate; when all the claimants claim in their own rights, as in equal degrees of kindred, and not *jure representationis*.

CAPITA, (succession by), where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

CAPITAL, of the Latin *caput* "the head", is used on various occasions, to express the relation of a head, chief, or principal: thus,

CAPITAL City, in geography, denotes the principal city of a kingdom, state, or province.

CAPITAL Stock, among merchants, bankers, and traders, signifies the sum of money which individuals bring to make up the common stock of a partnership when it is first formed. It is also said of the stock which a merchant at first puts into trade for his account. It likewise signifies the fund of a trading company or corporation, in which sense the word stock is generally added to it. Thus we say, the capital stock of the bank, &c. The word capital is opposed to that of profit or gain, though the profit often increases the capital, and becomes of itself part of the capital, when joined with the former.

CAPITAL Crime, such a one as subjects the criminal to capital punishment, that is, to loss of life *. See *CRIME* and *Punishment*.

Capital
Capitol.

Capitol
Capitoul.

CAPITAL Picture, in painting, denotes one of the finest and most excellent pieces of any celebrated master.

CAPITAL Letters, in printing, large or initial letters, wherein titles, &c. are composed; with which all periods, verses, &c. commence; and wherewith also all proper names of men, kingdoms, nations, &c. begin. The practice which, for some time, obtained among our printers, of beginning every substantive with a capital, is now justly fallen into disrepute; being a manifest perversion of the design of capitals, as well as an offence against beauty and distinctness.

CAPITAL, in architecture, the uppermost part of a column or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature. See **ARCHITECTURE**.

CAPITANATA, one of the 12 provinces of the kingdom of Naples, in Italy, bounded on the north by the Gulph of Venice, on the east by the Terra di Bari, on the south by the Basilicata and the Farther Principato, and on the west by the county di Molise and a small part of Hither Abruzzo. It is a level country, without trees; the soil sandy, the air hot: the land, however, near the rivers, is fertile in pastures. The capital town is Manfredonia.

CAPITANIA, in geography, an appellation given to the 12 governments established by the Portuguese in the Brasils.

CAPITATION, a tax or imposition raised on each person, in proportion to his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it *tributum*, by which taxes on persons are distinguished from taxes on merchandise, which were called *vectigalia*.

Capitations are never practised among us but in exigencies of state. In France the capitation was introduced by Lewis XIV. in 1695; and is a tax very different from the *tailles*, being levied from all persons whether they be subject to the *taille* or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

CAPITE, in law, (from *caput*, i. e. *rex*; whence *tenere in capite*, is to hold of the king, the head or lord paramount of all the lands in the kingdom): An ancient tenure of land, held immediately of the king, as of his crown, either by knight's service, or by socage. It is now abolished. See **TENURE**.

CAPITE Censi, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 365 asses. They were supposed to have been thus called, because they were rather counted and marshalled by their heads than by their estates. The *capite censi* made part of the sixth class of citizens, being below the *proletarii*, who formed the other moiety of that class. They were not enrolled in the army, as being judged not able to support the expence of war; for in those days the soldiers maintained themselves. It does not appear, that before Caius Marius any of the Roman generals lifted the *capite censi* in their armies.

CAPITOL, **CAPITOLIUM**, in antiquity, a famous fort or castle, on the Mons Capitolinus at Rome, wherein was a temple dedicated to Jupiter, thence also denominated *Capitolinus*, in which the senate anciently assembled; and which still serves as the city-hall, or town-house, for the meeting of the conservators of the

Roman people.—It had its name *capitol*, from *caput*, a man's head, said to have been found fresh, and yet bleeding, upon digging the foundation of the temple built in honour of Jupiter. Arnobius adds, that the man's name was *Tolus*, whence *caput-tolium*.—The first foundations of the capitol were laid by Tarquin the Elder, in the year of Rome 139. His successor Servius raised the walls; and Tarquin the Proud finished it, in the year 221. But it was not consecrated till the third year after the expulsion of the kings, and establishment of the consulate. The ceremony of the dedication of the temple was performed by the consul Horatius in 246.

The capitol consisted of three parts; a nave sacred to Jupiter; and two wings, the one consecrated to Juno, the other to Minerva: it was ascended to by stairs; the frontispice and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifices had been offered to the gods.

Both the inside and outside were enriched with an infinity of ornaments, the most distinguished of which was the statue of Jupiter, with his golden thunderbolt, his sceptre, and crown. In the capitol also were a temple to Jupiter the guardian, and another to Juno, with the mint; and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits of religion, such as the ancilia, the books of the Sibyls, &c.

The capitol was burnt under Vitellius, and rebuilt under Vespasian. It was burnt a second time by lightning under Titus, and restored by Domitian.

Anciently the name *capitol* was likewise applied to all the principal temples, in most of the colonies throughout the Roman empire; as at Constantinople, Jerusalem, Carthage, Ravenna, Capua, &c.—That of Thoulouse, has given the name of *capitoul* to its echevins or sheriffs.

CAPITOLINE GAMES, annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the capitol's not being taken by the Gauls. Plutarch tells us, that a part of the ceremony consisted in the public criers putting up the Hetrurians to sale by auction: they also took an old man, and tying a golden bulla about his neck, exposed him to the public derision. Festus says they also dressed him in a pretexta.—There was another kind of Capitoline games, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians, and musicians. These last Capitoline games were celebrated every five years, and became so famous, that, instead of calculating time by lustra, they began to count by Capitoline games, as the Greeks did by Olympiads. It appears, however, that this custom was not of long continuance.

CAPITOLINUS (Julius), an historian in the beginning of the fourth age under Dioclesian, to whom he inscribed the Lives of Verus, Antoninus Pius, Claudius Balbinus, Macrinus, the Maximins, and the Gordians. He wrote other lives, which are most of them lost.

CAPITOUL, an appellation given to the chief magistrates of Thoulouse, on account of their meeting in a place called the *Capitol*. They are eight in number; are chosen annually; and have each the government of

Capitulation a capitulate, or precinct, like the wards of London.

CAPITULATION, in military affairs, a treaty made between the inhabitants or garrison of a place besieged, and the besiegers, for the delivering up the place on certain conditions.—The most honourable and ordinary terms of capitulation are, To march out at the breach with arms and baggage, drums beating, colours flying, a match lighted at both ends, and some pieces of cannon, waggons and convoys for their baggage and for their sick and wounded.

CAPITULATION, in the German polity, a contract which the emperor makes with the electors, in the name of all the princes and states in the empire, before he is declared emperor, and which he ratifies before he is raised to that sovereign dignity. The principal points which the emperor undertakes to observe are, 1. To defend the church and empire. 2. To observe the fundamental laws of the empire. And, 3. To maintain and preserve the rights, privileges, and immunities of the electors, princes, and other states of the empire, specified in the capitulation. These articles and capitulations are presented to the emperor by the electors only, without the concurrence of the other states, who have complained from time to time of such proceedings; and in the time of the Westphalian treaty, in 1648, it was proposed to deliberate in the following diet, upon a way of making a perpetual capitulation; but the electors have always found means of eluding the execution of this article. In order, however, to give some satisfaction to their adversaries, they have inserted in the capitulations of the emperors, and in that of Francis I. in particular, a promise to use all their influence to bring the affair of a perpetual capitulation to a conclusion. Some German authors own, that this capitulation limits the emperor's power; but maintain that it does not weaken his sovereignty: though the most part maintain that he is not absolute, because he receives the empire under conditions which sets bounds to an absolute authority.

CAPNOIDES, in botany, the trivial name of a species of *FUMARIA*.

CAPO FINO, a large barren rock in the territory of the Genoese, which has a castle on its eastern peak. Near it is a small harbour of the same name, 13 miles east by south of Genoa.

CAPO d' Istria, a considerable town of Italy, in Istria, on the gulph of Trieste, with a bishop's see, and subject to the Venetians. The air is wholesome and temperate; its principal revenue consists in wine and salt. E. Long. 14. o. N. Lat. 45. 48.

CAPON, a cock-chicken, gelded as soon as left by the dam, or as soon as he begins to crow. They are of use either to lead chickens, ducklings, pheasants, &c. and defend them from the kites and buzzards; or to feed on the table, they being reckoned more delicate than either a cock or a hen.

CAPONIERE, or **CAPONIERE**, in fortification, a covered lodgement, sunk four or five feet into the ground, encompassed with a little parapet about two feet high, serving to support several planks covered with earth. The caponiere is large enough to contain 15 or 20 soldiers; and is usually placed in the glacis on the extremity of the counterescarp, and in dry moats; having little embrasures for the soldiers to fire through.

CAPPADOCIA, an ancient kingdom of Asia,

comprehending all that country which lies between mount Taurus and the Euxine Sea. It was divided by the Persians into two satrapies or governments; by the Macedonians into two kingdoms, the one called *Cappadocia ad Taurum*; the other *Cappadocia ad Pontum*, and commonly *Pontus*; for the history, &c. of which last, see the article *PONTUS*.

CAPPADOCIA Magna, or *Cappadocia* properly so called, lies between the 38 and 41 degrees of north latitude. It was bounded by Pontus on the north, Lycania and part of Armenia Major on the south, Galatia on the west, and by Euphrates and part of Armenia Minor on the east. The first king of Cappadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know scarce any thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests and fame of the Macedonian monarch, continued unshaken in his fidelity to the Persians. Alexander was prevented by death from invading his dominions; but Perdicas marching against him with a powerful and well disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him, with all those of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed, till the civil dissensions which arose among the Macedonians gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Cappadocia, opposed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariarathes II. He applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who proved a very warlike prince, and having overcome Arsaces, founder of the Parthian monarchy, considerably enlarged his own dominions.

He was succeeded by Ariarathes V. who marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans; but Antiochus being defeated, the king of Cappadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards assisted the republic with men and money against Perseus king of Macedon, on which account he was by the senate honoured with the title of the *friend and ally of the Roman people*. He left the kingdom in a very flourishing condition to his son Mithridates, who on his accession took the name of Ariarathes VI.

This prince (surnamed *Philopator*, from the filial respect and love he shewed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere good-nature he restored Mithrobuzanes son to Ladriades king of the Lesser Armenia to his father's kingdom.

Cappadocia. kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. These differences, however, were settled, before they came to an open rupture, by the Roman legates; and Ariarathes seeing himself thus delivered from an impending war by the mediation of the republic, presented the senate with a golden crown, and offered his service wherever they thought proper to employ him. The senate in return sent him a staff, and chair of ivory; which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter king of Syria had offered Ariarathes his sister in marriage, the widow of Perseus king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his so doing was in the highest degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being greatly incensed at the slight put upon his sister, set up a pretender to the throne, one Orophernes, a supposititious, or, as others call him, a natural son of the deceased king. The Romans ordered Eumenes king of Pergamus to assist Ariarathes with all his forces: which he did, but to no purpose; for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 159 years before Christ, and the usurpers immediately dispatched ambassadors to Rome with a golden crown. The senate declined accepting the present, till they heard his pretensions to the kingdom; and this Orophernes, by suborned witnesses, made appear so plain, that the senate decreed that Ariarathes and he should reign as partners; but next year, Orophernes was driven out by Attalus brother to Eumenes, and his successor by the kingdom of Pergamus.

Ariarathes, being thus restored, immediately demanded of the Prieniens 400 talents of gold which Orophernes had deposited with them. They honestly replied, that as they had been trusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name. Upon this, the king entered their territories with an army, destroying all with fire and sword. The Prieniens, however, still persevered in their integrity; and though their city was besieged by the united forces of Ariarathes and Attalus, not only made an obstinate defence, but found means to restore the sum to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the siege, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Assyria, joined Alexander Epiphanes against Demetrius Soter, by whom he had been formerly driven out of his kingdom. In the very first engagement Demetrius was slain, and his army entirely dispersed, Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Arsitonicus who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Crassus proconsul of Asia was taken, and the Roman army cut in pieces. He left six sons by his wife Laodice, on whom the Romans bestowed Lycania and Cilicia. But Laodice, fearing lest her children, when

they came of age, should take the government out of Cappadocia, her hands, poisoned five of them, the youngest only having escaped her cruelty by being conveyed out of the kingdom. The queen herself was soon after put to death by her subjects, who could not bear her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who, soon after his accession, married another Laodice, daughter of Mithridates the Great, hoping to find in that prince a powerful friend to support him against Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates, instead of assisting, procured one Gordius to poison, his unhappy son-in-law; and, on his death, seized the kingdom, under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom. The Cappadocians at first fancied themselves obliged to their new protector; but, finding him unwilling to resign the kingdom to the lawful heir, they rose up in arms, and, driving out all the garrisons placed by Mithridates, placed on the throne Ariarathes VIII. eldest son of their deceased king.

The new prince found himself immediately engaged in a war with Nicomedes; but, being assisted by Mithridates, not only drove him out of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, Mithridates seeking for some pretence to quarrel with Ariarathes, insisted upon his recalling Gordius, who had murdered his father; which being rejected with abhorrence, a war ensued. Mithridates took the field first, in hopes of over-running Cappadocia before Ariarathes could be in a condition to make head against him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in sight of both armies, stabbed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportunity of possessing himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his prefects, soon shook off the yoke; and recalling the king's brother, who had fled into the province of Asia, proclaimed him king. He was scarce seated on the throne, however, before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief; and Mithridates bestowed the kingdom on his son, who was then but eight years old, giving him also the name of *Ariarathes*. But Nicomedes Philopator king of Bithynia, fearing lest Mithridates, having now got possession of the whole kingdom of Cappadocia, should invade his territories, suborned a youth to pass himself for the third son of Ariarathes, and to present to them a petition in order to be restored to his father's kingdom. With him he sent to Rome Laodice, sister of Mithridates, whom he had married after the death of her former husband Ariarathes. Laodice declared before the senate, that she had three sons by Ariarathes, and that the petitioner was one of them; but that she had been obliged

ged to keep him concealed, lest he should undergo the same fate with his brothers. The senate assured him that they would at all events reinstate him in his kingdom. But, in the mean time, Mithridates having notice of these transactions, dispatched Gordius to Rome, to undeceive the senate, and to persuade them that the youth to whom he had resigned the kingdom of Cappadocia was the lawful son of the late king, and grandson to Ariarathes who had lost his life in the service of the Romans against Aristonicus. This unexpected embassy put the senate upon inquiring more narrowly into the matter, whereby the whole plot was discovered; upon which Mithridates was ordered to resign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a short time sent ambassadors to Rome, acquainting the senate that they could not live without a king. This greatly surprised the Romans, who had such an aversion to royal authority; but they gave them leave to elect a king of their own nation. As the family of Pharnaces was now extinct, the Cappadocians chose Ariobarzanes; and their choice was approved by the senate, he having on all occasions shown himself a steady friend to the Romans.

Ariobarzanes had scarce taken possession of his kingdom, when he was driven out by Tigranes king of Armenia; who resigned Cappadocia to the son of Mithridates, in pursuance of an alliance previously concluded between the two parties. Ariobarzanes fled to Rome; and, having engaged the senate in his cause, he returned into Asia with Sylla, who was enjoined to restore him to his kingdom. This was easily performed by Sylla, who, with a small body of troops, routed Gordius who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had scarce turned his back, when Ariobarzanes was again driven out by Ariarathes the son of Mithridates, on whom Tigranes had bestowed the kingdom of Cappadocia. This obliged Sylla to return into Asia, where he was attended with his usual success, and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near mount Stella, restored Ariobarzanes to his throne, and rewarded him for his services during the war, with the provinces of Sophene, Gordiene, and great part of Cilicia. The king, however, being now advanced in years, and desirous of spending the remainder of his life in ease, resigned the crown to his son Ariobarzanes, in presence of Pompey; and never afterwards troubled himself with affairs of state.

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but after the death of Pompey, he was received into favour by Cæsar, who even bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the king of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put

to death. He was succeeded by his brother Ariobarzanes III. who was, by Marc Anthony, deprived both of his kingdom and life; and in him ended the family of Ariobarzanes.

Archelaus, the grandson of that general of the same name who commanded against Sylla in the Mithridatic war, was by Marc Anthony placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preference was entirely owing to his mother Glaphyra, a woman of great beauty, but of a loose behaviour, who, in return for her compliance with the desires of Anthony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Anthony, he joined the latter; but, at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Trachea, for having assisted the Romans in clearing the seas of pirates who greatly infested the coasts of Asia. He contracted a strict friendship with Herod the Great, king of Judæa; and even married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate; for he had always been hated by that emperor, because in his retirement at Rhodes he had paid him no sort of respect. This had proceeded from no aversion in him to Tiberius, but from the warning given Archelaus to his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been sent to compose the differences of the east, whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shewn him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and hastened to Rome; where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he was accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief, or, as others say, laid violent hands on himself. He is said to have reigned 50 years.

On the death of Archelaus, the kingdom of Cappadocia was reduced to a Roman province, and governed by those of the equestrian order. It continued subject to the Romans till the invasion of the eastern empire by the Turks, to whom it is now subject, but has no distinguishing modern name. In what was anciently called *Cappadocia*, however, the Turks have four Beglerbegs, called *Sivas*, *Trebizond*, *Marasch*, and *Cogni*.

In the time of the Romans, the inhabitants of Cappadocia bore so bad a character, and were reputed so vicious and lewd, that, among the neighbouring nations, a wicked man was emphatically called a *Cappadocian*. In after ages, however, their lewd disposition was so corrected and restrained by the pure doctrines of Christianity, that no country whatever has produced greater champions of the Christian religion, or given to the church prelates of more unblemished characters.

We have now no system of the Cappadocian laws, and scarce wherewithal to form any particular idea of them. As to their commerce, they carried on a considerable

Cappadocia trade in horses, great numbers of which were produced in their country; and we read of them in Scripture as frequenting the fairs of Tyre with this commodity. As Cappadocia abounded with mines of silver, brass, iron, and alum, and afforded great store of alabaster, crystal, and jasper, it is probable that they might supply the neighbouring countries with these commodities.

The religion of the ancient Cappadocians was much the same with that of the Persians. At Comana there was a rich and stately temple dedicated to Bellona; whose battles the priests and their attendants used to represent on stated days, cutting and wounding each other as if seized with an enthusiastic fury. No less famous and magnificent were the temples of Apollo Catantius, and of Jupiter: the last of which had 3000 sacred servants, or religious votaries. The chief priest was next in rank to that of Comana; and, according to Strabo, had an yearly revenue of 15 talents. Diana Persica was worshipped in a city called *Casaballa*, where women, devoted to the worship of that goddess, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Diospolis, and of Anias at Zela, were likewise held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of consequence; and the chief among the priests was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior servants and officers of the temple. The Romans, who willingly adopted all the superstitions and superstitious rites of the nations they conquered, greatly increased the revenues of this and other temples; conferring the priesthood on such as they thought most fit for carrying on their designs.—We are told that human sacrifices were offered at Comana; and that this barbarous custom was brought by Orestes and his sister Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But this custom, if ever it obtained in Cappadocia, was abolished in the times of the Romans.

CAPPANUS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships; to which it is extremely pernicious, especially in the East and West Indies: to prevent this, several ships have lately been sheathed with copper; the first trial of which was made on his majesty's frigate the *Alarm*.

CAPPARIS, the CAPER-BUSH; a genus of the myogynia order, belonging to the polyandria class of plants. There are seven species. The spinosa, or common caper, is a low shrub, generally growing out of the joints of old walls, the fissures of rocks, and amongst rubbish, in most of the warm parts of Europe: it hath woody stalks, which send out many lateral slender branches; under each of these are placed two short crooked spines, between which and the branches comes out the foot-stalks of the leaves, which are single, short, and sustain a round, smooth, entire leaf. At the intermediate joints between the branches, come out the flowers on long foot-stalks; before these expand, the bud with the empalement is gathered for pickling. Those which are last, expand in form of a single rosette, having five large white petals, which are roundish and concave; in the

middle are placed a great number of long filamina, surrounding a style which rises above them, and crowned with an oval germin, which afterwards becomes a capsule filled with kidney-shaped seeds.

Culture. This plant is very difficultly preserved in Britain: it delights to grow in crevices of rocks, old walls, &c. and always thrives best in an horizontal posture; so that, when planted either in pots, or in the full ground, they seldom thrive, though they may be kept alive for some years. They are propagated by seeds in the warm parts of Europe, but very seldom in Britain.

Uses. The buds, pickled with vinegar, &c. are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and assist digestion; and to be particularly useful as detergents and aperients in obstructions of the liver and spleen.

CAPRA, or GOAT, a genus of quadrupeds belonging to the order of pecora. The horns are hollow, turned upwards, erect, and scabrous. There are eight fore-teeth in the under jaw, and none in the upper; and they have no dog-teeth. This genus consists of 12 species, *viz.*

I. The HIRCUS, or common goat, with arched carinated horns, and a long beard. It is a native of the eastern mountains.

The goat is an animal of more sagacity than the sheep. Instead of having an antipathy at mankind, they voluntarily mingle with them, and are easily tamed. Even in uninhabited countries, they betray no savage dispositions. In the year 1698, an English vessel having put in to the island of Bonavista, two negroes came aboard, and offered gratis to the captain as many goats as he pleased. The captain expressed his astonishment at this offer. But the negroes replied, that there were only 12 persons in the island; that the goats had multiplied to such a degree, that they were become extremely troublesome; and that, instead of having any difficulty in catching them, they followed the men wherever they went, and were so obstinately officious, that they could not get quit of them upon any account whatever.

Goats are sensible of caresses, and capable of a considerable degree of friendship. They are stronger, more agile, and less timid, than sheep. They have a lively, capricious, and wandering disposition; are fond of high and solitary places; and frequently sleep upon the very points of rocks. They are more easily supported than any other animal of the same size; for there is hardly an herb, or the bark of a tree, which they will not eat with pleasure. Neither are they liable to so many diseases as sheep: they can bear heat and cold with less inconvenience. The actions and movements of animals depend more upon the force and variety of their sensations, than the structure of their bodies: the natural inconstancy or frivolidness of goats is accordingly expressed by the irregularity of their actions: they walk, stop short, run, jump, show, and hide themselves, as it were by mere caprice, and without any other cause than what arises from the natural vivacity of their temper.

The buck will copulate when he is a year old, and the female when he is seven months. But as this is rather premature, they are generally restrained till they be

Capparis,
Capra.

Capra.

Capra.

be 18 months or two years. The buck is bald, beautiful, and vigorous; one is sufficient to serve 150 females. A buck for propagation should be large, handsome, and about two years of age; his neck should be short, and fleshy; his head slender; his ears pendent; his thighs thick; his limbs firm; his hair black, thick, and soft; and his beard should be long and bushy. The females are generally in season from September to the end of November. At that time the males drive whole flocks of the females continually from place to place, and fill the whole atmosphere around them with their strong disagreeable odour; which, tho' as disagreeable as asafetida itself, yet may be conducive to prevent many distempers, and to cure nervous and hysterical ones. Horses are supposed to be much refreshed by it; on which account many people keep a he-goat in their stables or stalls.

Goats go with young four months and an half, and bring forth from the latter end of February to the latter end of April: having only two teats, they generally bring forth but one or two young; sometimes three; and in good warm pastures there have been instances, tho' rare, of their bringing forth four at a time. They continue fruitful till they are seven years of age; but a buck goat is seldom kept after he is five. Both young and old are affected by the weather; a rainy season makes them thin, a dry sunny one makes them fat and blythe: their excessive venery prevents their longevity; for in our climate they seldom live above 11 or 12 years.

The food of this animal costs next to nothing, as it lives mostly upon such plants as are rejected by other cattle, and can support itself even upon the most barren mountains. But their produce is valuable. The whitest wigs are made of its hair; for which purpose that of the he-goat is most in request: the whitest and clearest is selected from that which grows on the haunches, where it is longest and thickest: a good skin well haired is sold for a guinea; though a skin of bad hue, and so yellow as to baffle the barber's skill to bleach, will not fetch above 18 d. or 2 s. The Welsh goats are far superior in size, and in length and fineness of hair, to those of other mountainous countries. Their usual colour is white: those of France and the Alps are short-haired, reddish, and the horns small. Boliters made from the hair of a goat were in use in the days of Saul, as appears from 1 Samuel xix. 13. The species very probably was the Angora goat, which is only found in the East; and whose soft and silky hair supplied a most luxurious couch.

The suet of the goat is in great esteem as well as the hair. Many of the inhabitants of Caernarvonshire suffer these animals to run wild on the rocks in winter as well as in summer; and kill them in October for the sake of their fat, either by shooting them with bullets, or by running them down with dogs like deer. The goats killed for this purpose are about four or five years old. Their suet will make candles far superior in whiteness and goodness to those made from that of the sheep or the ox, and accordingly brings a much greater price in the market; nor are the horns without their use, the country people making of them excellent handles for tucks and pen-knives. The skin is peculiarly well adapted for the glove manufactory, especially that of the kid: abroad it is dressed and made into stockings, bed-

ticks, bed-hangings, sheets, and even shirts. In the army it covers the horseman's arms, and carries the foot-soldier's provisions. As it takes a dye better than any other skin, it was formerly much used for hangings in the houses of people of fortune, being susceptible of the richest colours, and when flowered and adorned with gold and silver became an elegant and superb furniture.

The flesh is of great use to the inhabitants of those countries which abound with goats; and affords them a cheap and plentiful provision in the winter months, when the kids are brought to market. The haunches of the goat are frequently salted and dried, and supply all the uses of bacon: this by the Welsh is called *cob yr wden*, or hung venison. The meat of a splayed goat of six or seven years old (which is called *hyff*) is reckoned the best; being generally very fat and sweet. This makes an excellent patty; goes under the name of *rock venison*; and is little inferior to that of the deer.

The milk of the goat is sweet, nourishing, and medicinal. It is an excellent succedaneum for ass's milk; and has (with a tea-spoonful of harts horn drunk warm in bed in the morning, and at four in the afternoon, and repeated for some time) been a cure for phthical people before they were gone too far. In some of the mountainous parts of Scotland and Ireland, the milk is made into whey, which has done wonders in this and other cases where coolers and restoratives are necessary; and to many of those places there is as great a resort of patients of all ranks, as there is in England to the spas or baths. It is not surprising that the milk of this animal is so salutary, as it grows only on the tops, tendrils, and flowers, of the mountain shrubs, and medicinal herbs; rejecting the grosser parts. The blood of the he-goat, dried, was formerly reckoned a specific in pleurisy, and is even taken notice of by Dr Mead for this purpose, but is now deservedly neglected. Cheese made of goat's milk is much valued in some of our mountainous countries, when kept to a proper age; but has a peculiar taste and flavour.

II. The *IBEX*, or wild-goat, is the stock from whence the tame species sprung. It has large knotty horns reclined upon its back, is of a yellowish colour, and its beard is black. The females are less, and have smaller horns, more like those of a common he-goat, and with few knobs on the upper surface: they bring one young one, seldom two, at a birth. They inhabit the highest Alps of the Grisons country and the Valais; are also found in Crete. They are very wild, and difficult to be shot, as they always keep on the highest points. Their chase is exceedingly dangerous: being very strong, they often tumble the incautious huntsman down the precipices, except he has time to lie down and let the animals pass over him. They are said not to be long-lived.

III. The *MAMBRINA*, or Syrian goat, with reclined horns, pendent ears, and a beard. It is a native of the East. Their ears are of a vast length; from one to two feet; and sometimes so troublesome, that the owners cut off one to enable the animal to feed with more ease. These animals supply Aleppo with milk.

IV. The *RUPICAPRA*, or Ramo-goat, has erect and hooked horns. The body is of a dusky red colour; but the front, top of the head, gullet, and inside of the ears, are white; the under part of the tail is blackish; and

Capra.

the upper lip is a little divided. It inhabits the Alps of Dauphine, Switzerland, and Italy; the Pyrenean mountains; Greece, and Crete: does not dwell so high in the hills as the ibex, and is found in greater numbers. They feed before sun-rise, and after sun-set. In winter, they lodge in hollows of the rocks, to avoid the falls of the Avelanches: during that season, they eat the slender twigs of trees, or the roots of plants and herbs which they find beneath the snow. They are very timid and watchful: each herd has its leader, who keeps sentry on some high place while the rest are at food; and if it sees an enemy, gives a sharp sort of hiss, by way of signal, when they instantly take to flight. They have a most piercing eye, and quick ear and scent; and are excessively swift and active. They are hunted during winter for their skins, which are very useful in manufactures; and for their flesh, which is very well tasted. The chase is a laborious employ: they must be got at by surprise, and are often shot with rifle-barrel'd guns. In their stomach is often a hairy ball, covered with a hard crust, of an oblong form. They are said to be long-lived; bring two, seldom three, young ones at a time.

V. The *DEPRESSA*, is an African goat, with small depressed horns, bent inwards, lying on the head. It is about the size of a kid; and the hair is long and pendulous.

VI. The *REVERSA*, is likewise an African goat, with erect horns, and curved back at the points. It is about the size of a kid of a year old.

VII. The *GAZZELLA*, has long, erect, cylindrical horns, annulated near the base. It inhabits Egypt, the Cape, Arabia, the Levant, and India, dwelling in the plains.

VIII. The *CERVICAPRA*, with plated cylindrical horns, inhabits Barbary. The hair near the horns is longer than in any other part of the body. The females want horns: Mr Hasselquist gives the following account of this species. "The cervicapra is larger, swifter, and wilder, than the common rock-goat, and can scarcely be taken without a falcon. It is met with near Aleppo. I have seen a variety of this which is common in the East, and the horns appear different; perhaps it is a distinct species. This animal loves the smoke of tobacco; and, when caught alive, will approach the pipe of the huntsman, though otherwise more timid than any animal. This is perhaps the only creature, besides man, that delights in the smell of a poisonous and stinking plant. The Arabians hunt it with a falcon (*falco gentilis*, Lin.) I had an excellent opportunity of seeing this sport near Nazareth in Galilee. An Arab, mounted on a swift courser, held the falcon in his hand, as huntsmen commonly do: when he espied the rock-goat on the top of a mountain, he let loose the falcon, which flew in a direct line like an arrow, and attacked the animal; fixing the talons of one of his feet into the cheek of the creature, and the other into its throat, extending his wings obliquely over the animal; spreading one towards one of its ears, and the other to the opposite hip. The animal, thus attacked, made a leap twice the height of a man, and freed himself from the falcon: but being wounded, and losing his strength and speed, he was again attacked by the falcon; which fixed the talons of both its feet into the throat of the animal, and held it fast, till the hunt-

Capra.

man coming up, took it alive, and cut its throat; the falcon drinking the blood as a reward for his labour. A young falcon, which was learning, was likewise put to the throat of the goat: by this means are young falcons taught to fix their talons in the throat of the animal, as being the properest part; for should the falcon fix them in the creature's hip, or some other part of the body, the huntsman would not only lose his game, but his falcon also: for the animal, roused by the wound, which could not prove mortal, would run to the defarts and the tops of the mountains, whither its enemy, keeping its hold, would be obliged to follow; and, being separated from its master, must of course perish."

IX. The *BEZOARTICA*, or bezoar goat, is bearded, and has cylindrical, arched, and wholly annulated horns. It is a native of Persia. The bezoar is found in one of its stomachs, called *abomasus* *.

* See Bezoar, and Abomasus.

X. The *TARTARICA*, has cylindrical, straight, annulated horns; the points inclining inward, the ends smooth; the other part surrounded with very prominent annuli; of a pale yellow colour, and the greatest part femipellucid; the cutting teeth are placed so loose in their sockets, as to move with the least touch. The male is covered with rough hair like the he-goat, and has a very strong smell; the female is smoother. The hair on the bottom of the sides and the throat is long, and resembles wool; that on the sides of the neck and head is hoary; the back and sides of a dirty white; the breast, belly, and inside of the thighs, of a shining white. The females are hornless and timid: if attacked by wolves or dogs, the males place them in a circle, and stand round them with their heads towards the enemy, and will defend them stoutly. They bleat like sheep: their common pace is a trot; when they go faster, it is by leaps. They are swifter than roebucks. They feed by lifting up the upper mandible, and going backward. The skin is soft, and excellent for gloves, belts, &c. Their best season is in September: at other times, the skins are penetrated by worms. The fat resembles that of mutton; in taste, like that of a buck: the head is reckoned the most delicate part. They are found between the Tanais and Boristhenes, and as far as Astracan, in flocks of 6000 or 10,000.

XI. The *AMMON*, has femicircular, plain, white horns, and no beard. It is about the size of a ram, and is a native of Siberia.

XII. The *DORCAS*, or antelope, has cylindrical annulated horns, bent backward, contorted, and arising from the front between the eyes. It is a native of Africa and Mexico. These animals are of a most elegant and active make; of a restless and timid disposition; extremely watchful; of great vivacity; remarkably swift; exceedingly agile; and most of their boundings so light, so elastic, as to strike the spectator with astonishment. What is very singular, they will stop in the middle of their course for a moment gaze at their pursuers, and then resume their flight.

As the chase of these animals is a favourite diversion with the Eastern nations, from that may be collected proofs of the rapid speed of the antelope tribe. The grey-hound, the fleetest of dogs, is unequal in the course; and the sportsman is obliged to call in the aid of the falcon trained to the work, to seize on the animal and impede its motions, to give the dogs time to overtake it. In India and Persia a sort of leopard is made use of in the chase;

Capra
Capricorn.Capricorn,
Capricorn-
tion.

chace: this is an animal that takes its prey, not by swiftness of foot, but by the greatnets of its springs, by motions similar to that of the antelope; but should the leopard fail in its first essay, the game escapes.

Some species of the antelopes form herds of 2000 or 3000, while others keep in small troops of five or six. They generally reside in hilly countries; though some inhabit plains: they often browse like the goat, and feed on the tender shoots of trees, which gives their flesh an excellent flavour. This is to be understood of those that are taken in the chace; for those that are fattened in houses are far less delicious. The flesh of some species are said to taste of musk, which perhaps depends on the qualities of the plants they feed on.

Mr Pennant makes the antelope a distinct genus of animals, forming a link between the goat and the deer*: with the first of which they agree in the texture of the horns, which have a core in them, and they never cast them; with the last, in the elegance of their form, and great swiftness. He distinguishes several species, among which he ranks the *gasella*, the *ceruicapra*, the *bezartica*, and the *tartarica* of Linnaeus, described above, VII. VIII. IX. X. with the *moschus grimmia* of the same author.

CAPRA-Saltans, in meteorology, a fiery meteor or exhalation sometimes seen in the atmosphere. It forms an inflected line, resembling in some measure the caperings of a goat; whence it has its name.

CAPRAIA, an isle of Italy, in the Tuscan sea, to the north-east of Corsica, on which it depends. It is pretty populous, and has a strong castle for its defence. It is about 15 miles in circumference. E. Long. 11. 5. N. Lat. 43. 15.

CAPRARIA, in botany, a genus of the angiosperma order, belonging to the didynamia class of plants. There is but one species, the biflora, which is a native of the warm parts of America. Being a troublesome weed, and without beauty, it is never cultivated, except in botanic gardens for the sake of variety.

CAPRAROLA, one of the most magnificent palaces in Italy, seated on a hill, in Ronciglione, whose foot is watered by the river Tircia. It was built by cardinal Farnese; and has five fronts, in the middle of which is a round court, though all the rooms are square, and well proportioned. It is 27 miles north-west of Rome.

CAPRÆ. See CAPRI.

CAPREOLUS (Elias), an excellent civilian, and learned historian, born in Brescia in Italy, wrote an history of Brescia, and other works: died in 1519.

CAPRI, (anciently *Capræ*), a city and island at the entrance of the gulph of Naples, E. Long. 14. 50. N. Lat. 40. 45.—The island is only four miles long, and one broad; the city is a bishop's see, situated on a high rock at the west end of the island. Capræ was anciently famous for the retreat of the emperor Tiberius for seven years, during which he indulged himself in the most scandalous debaucheries*. There stood a pharos on this island, which, a few days before the death of that emperor, was overthrown by an earthquake.

CAPRIATA (Peter John), a civilian and historian, was born at Genoa. He wrote, in Italian, the history of the wars of Italy; an English translation of which was printed in London in 1663.

CAPRICORN, in astronomy, one of the 12 signs

of the zodiac. See ASTRONOMY, n° 206.

The ancients accounted Capricorn the tenth sign; and when the sun arrived thereat, it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the 11th sign; and it is at the sun's entry into Sagittary that the solstice happens, though the ancient manner of speaking is still retained.

This sign is represented on ancient monuments, medals, &c. as having the forepart of a goat and the hindpart of a fish, which is the form of an *Ægipan*; sometimes simply under the form of a goat.

Tropic of CAPRICORN, a lesser circle of the sphere, which is parallel to the equinoctial, and at 23° 30' distance from it southwards; passing through the beginning of Capricorn.

CAPRIFICATION, a method used in the Levant, for ripening the fruit of the domestic fig-tree, by means of insects bred in that of the wild fig-tree.

The most ample and satisfactory accounts of this curious operation in gardening are those of Tournefort and Pontedera; the former, in his Voyage to the Levant, and in a Memoir delivered to the academy of sciences at Paris in 1705; the latter, in his *Anthologia*. The substance of Tournefort's account follows. "Of the thirty species or varieties of the domestic fig-tree which are cultivated in France, Spain, and Italy, there are but two cultivated in the Archipelago. The first species is called *ornos*, from the old Greek *erinos*, which answers to *caprificus* in Latin, and signifies a wild fig-tree. The second is the domestic or garden fig-tree. The former bears successively, in the same year, three sorts of fruit, called *ornites*, *cratitires*, and *orni*; which, though not good to eat, are found absolutely necessary towards ripening those of the garden-fig. These fruits have a sleek even skin; are of a deep green colour; and contain in their dry and mealy inside several male and female flowers placed upon distinct foot-stalks, the former above the latter. The *ornites* appear in August, and continue to November without ripening: in these are bred small worms, which turn to a sort of gnats nowhere to be seen but about these trees. In October and November, these gnats of themselves make a puncture into the second fruit, which is called *cratitires*. These do not show themselves till towards the end of September. The *ornites* gradually fall away after the gnats are gone; the *cratitires*, on the contrary, remain on the tree till May, and inclose the eggs deposited by the gnats when they pricked them. In May, the third sort of fruit, called *orni*, begins to be produced by the wild fig-trees. This is much bigger than the other two; and when it grows to a certain size, and its bud begins to open, it is pricked in that part by the gnats of the *cratitires*, which are strong enough to go from one fruit to another to deposit their eggs. It sometimes happens that the gnats of the *cratitires* are slow to come forth in certain parts, while the *orni* in those very parts are disposed to receive them. In this case, the husbandman is obliged to look for the *cratitires* in another part, and fix them at the ends of the branches of those fig-trees whose *orni* are in a fit disposition to be pricked by the gnats. If they miss the opportunity, the *orni* fall, and the gnats of the *cratitires* fly away. None but those that are well acquainted with the culture know the critical moment of doing this: and in order

* See *Tiberius*.

order to know it, their eye is perpetually fixed on the bud of the fig; for that part not only indicates the time that the pricklers are to issue forth, but also when the fig is to be successfully pricked: if the bud is too hard and compact, the gnat cannot lay its eggs; and the fig drops, when the bud is too open.

"The use of all these three sorts of fruit is to ripen the fruit of the garden fig-tree, in the following manner. During the months of June and July, the peasants take the *orni*, at the time their gnats are ready to break out, and carry them to the garden fig-trees: if they do not nick the moment, the *orni* fall; and the fruit of the domestic fig-tree, not ripening, will in a very little time fall in like manner. The peasants are so well acquainted with these precious moments, that, every morning, in making their inspection, they only transfer to their garden fig-trees such *orni* as are well conditioned, otherwise they lose their crop. In this case, however, they have one remedy, though an indifferent one; which is, to strew over the garden fig-trees another plant in whose fruit there is also a species of gnats which answer the purpose in some measure."

The caprification of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practised at this day in the Archipelago and in Italy. These all agree in declaring, that the wild fig-tree, *caprificus*, never ripened its fruit; but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches.—The reason of this success possibly may be, that, by the punctures of these insects, the vessels of the fruit are lacerated, and thereby a greater quantity of nutritious juice derived thither. Perhaps, too, in depositing their eggs, the gnats leave behind them some sort of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw dipped in olive-oil. Plumbs and pears likewise, pricked by some insects, ripen much the faster for it; and the flesh round such puncture is better tasted than the rest. It is not to be disputed, that considerable changes happen to the contexture of fruits so pricked, just the same as to parts of animals pierced with any sharp instrument.

CAPRIMULGUS, GOAT-SUCKER, or *Fern-owl*, in ornithology, a genus of birds belonging to the order of passeress. The beak is incurved, small, tapering, and depressed at the base; the mouth opens very wide. There are two species. 1. The European, with the tubes of the nostrils hardly visible. It feeds on moths, gnats, doris or chaffers; from which Chariton calls it a *dorr-hawuk*, its food being entirely of that species of beetle during the month of July, the period of that insect's flight in this country. This bird migrates. It makes but a short stay with us: appears the latter end of May; and disappears, in the northern parts of our island, the latter end of August; but, in the southern, stays above a month later. It inhabits all parts of Britain from Cornwall to the county of Ross. Mr Scopoli seems to credit the report of their sucking the teats of goats, an error delivered down from the days of Aristotle. Its notes are most singular. The loudest so much resembles that of a large spinning wheel, that the Welsh call this bird *aderyn y droll*, or the wheel-bird. It be-

gins its song most punctually on the close of day, sitting usually on a bare bough, with the head lower than the tail, the lower jaw quivering with the efforts. The noise is so very violent, as to give a sensible vibration to any little building it chanced to alight on and emit this species of note. The other is a sharp squeak, which it repeats often; this seems a note of love, as it is observed to reiterate it when in pursuit of the female among the trees. It lays its eggs on the bare ground; usually two: they are of a long form, of a whitish hue, prettily marbled with reddish brown. The length of this bird is 10½ inches; extent 22. Plumage, a beautiful mixture of white, black, ash-colour, and ferruginous, disposed in lines, bars, and spots. The male is distinguished from the female by a great oval white spot near the end of the three first quill-feathers, and another on the outmost feathers of the tail.—2. The Americanus, has the tubes of the nostrils very conspicuous. It is a night-bird, and is found in America.

CAPRIOLES, in the menage, leaps that a horse makes in the same place without advancing, in such a manner, that, when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high menage. It differs from a croupade, in this, that, in a croupade, a horse does not show his shoes; and from a ballotade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore-quarters, and then his hind-quarters while his fore ones are yet in the air; for which end you must give him the whip and the pincion.

CAPSA, (anc. geog.), a large and strong town of Nomidia, situated amidst vast deserts, waste, uncultivated, and full of serpents, where Jugurtha kept his treasure. In his time it was taken and rased by Marius the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time, by Odeba a famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capsa. They are 24 fathoms in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were rebuilt by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzar, who sent a governor and troops into the province. In Marmol's time Capsa was very populous, and abounded with stately mosques and other structures of superb and elegant workmanship: but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunesse government. In the very centre of the city stands an inclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peevishness of temper. Both men and women dress handsomely except their feet, which they cover with coarse shoes of bungling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAP.

Capsicum,

CAPSICUM, or **GUINEA-PEPPER** a genus of the monogynia order, belonging to the pentandria class of plants.

Species. 1. The annuum, with oblong fruit, is the common long-podded capsicum commonly cultivated in the gardens. Of this there is one kind with red, and another with yellow fruit: and of these there are several varieties, differing only in the size and figure of their fruit. 2. The tetragonum, commonly called *bell pepper*. The fruit of this is red, and is the only kind proper for pickling, the skin being tender; whereas those of the other sorts are thin and tough. The pods are from an inch to an inch and half or two inches long; are very large, swelling, and wrinkled, flattened at the top, where they are angular, and sometimes stand erect, at others grow downward. 3. The cerasiforme, with a round smooth fruit, doth not grow so tall as the other sorts, but spreads near the ground; the leaves come out in clusters, are of a shining green, and stand on long footstalks. The fruit is of a beautiful red, and of the size of a cherry. 4. The pyramidale, is a native of Egypt, and hath much narrower leaves than the other sorts. The pods always grow erect, and are produced in great plenty, so that the plants make a good appearance for three months in the winter. 5. The minimum, commonly called *bird-pepper*, rises with a shrubby stalk four or five feet high; the leaves are of a lucid green; the fruit grows at the division of the branches, standing erect: these are small, oval, and of a bright red; they are much more sharp and biting than those of the other sorts. Besides these species, botanists describe as many more; viz. the cordiforme, with heart-shaped fruit; the angulosum, with angular heart-shaped fruit; the oliviforme, with oval fruit; the conoide, commonly called *hen-pepper*, with a conical red fruit growing erect; and the frutescens, with small pyramidal fruit growing erect; commonly called *Barbary pepper*. These, however, have no remarkable properties different from the others.

Culture. The three first species are annual plants, and must be propagated by seeds sown on a hot-bed in the spring, and treated in the same manner with other exotics; they will however bear the open air, after being inured to it by degrees. The plants of the second sort, whose fruit is used for pickling, should be taken from the hot-bed, and planted in a rich spot of ground in a warm situation about a foot and an half asunder. They must be shaded till they have taken root, and afterwards duly watered in dry weather, which will greatly promote their growth and cause them to be more fruitful, and likewise enlarge the size of the fruit. By this management, three or four crops of fruit for pickling may be obtained the same year. The other sorts are more tender; and therefore must be planted in pots plunged in a moderate hot-bed, and sheltered under a frame.

Uses, &c. The second sort, as already observed, produces fruit fit for pickling; for which purpose they must be gathered before they arrive at their full size, while their rind is tender. They must be slit down on one side to get out the seeds, after which they should be soaked two or three days in salt and water; when they are taken out of this and drained, boiling vinegar must be poured on them in a sufficient quantity to cover them, and closely stopped down for two months;

then they should be boiled in the vinegar to make them green; but they want no addition of any spice, and are the wholefomest and best pickle in the world. The tenth species is used for making what is called *cayenne-butter*, or *pepper-pots*, by the inhabitants of America, and which they esteem the best of all the spices. The following is a receipt for making of a pepper-pot. Take of the ripe seeds of this sort of capsicum, and dry them well in the sun: then put them into an earthen or stone pot, mixing flour between every stratum of pods; and put them into an oven after the baking of bread, that they may be thoroughly dried: after which they must be well cleaned from the flour; and if any of the stalks remain adhering to the pods, they should be taken off, and the pods reduced to a fine powder: to every ounce of this add a pound of wheat-flour, and as much leaven as is sufficient for the quantity intended. After this has been properly mixed and wrought, it should be made into small cakes, and baked in the same manner as common cakes of the same size: then cut them into small parts, and bake them again, that they may be as dry and hard as biscuit; which being powdered and sifted, is to be kept for use. This is prodigiously hot and acrimonious, setting the mouth as it were on fire. It is by some recommended as a medicine for flatulencies; but it is greatly to be doubted whether all those hot irritating medicines are not productive of more harm than good, in this country at least. If the ripe pods of capsicum are thrown into the fire, they will raise strong and noisome vapours, which occasion vehement sneezing, coughing, and often vomiting, in those who are near the place, or in the room where they are burnt. Some persons have mixed the powder of these pods with snuff, to give to others for diversion: but where it is in quantity, there may be danger in using it; for it will occasion such violent fits of sneezing, as to break the blood-vessels of the head.

CAPSQUARES, strong plates of iron which come over the trunnions of a gun, and keep it in the carriage. They are fastened by a hinge to the prize-plate, that they may lift up and down, and form a part of an arch in the middle to receive a third part of the thickness of the trunnions: for two thirds are let into the carriage, and the other end is fastened by two iron wedges called the *fore-locks* and *keys*.

CAPSTAN, or **CAPSTERN**, a strong massy column of timber, formed like a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It is let perpendicularly down through the decks of a ship; and is fixed in such a manner, that the men, by turning it horizontally with their bars, may perform any work which requires an extraordinary effort.

A capstern is composed of several parts, where *A* is Plate the barrel, *b* the whelps, *c* the drum-head, and *d* the spindle. The whelps rise out from the main body of the capstern like buttresses, to enlarge the sweep, so that a greater quantity of cable, or whatever rope encircles the barrel, may be wound about it at one turn, without adding much to the weight of the capstern. The whelps reach downwards from the lower part of the drum-head to the deck. The drum-head is a broad, cylindrical piece of wood resembling a mill-stone, and fixed immediately above the barrel and whelps. On the outside of this piece are cut a number of square holes.

Capsicum
Capitan.

LXVII.
fig. 5.

Capstan.

holes parallel to the deck to receive the bars. The spindle or pivot *d*, which is fixed with iron, is the axis or foot upon which the capstern rests, and turns round in the faucy, which is a sort of iron socket let into a wooden block or standard called the *step*, resting upon and bolted to the beams.

Besides the different parts of the capstern above explained, it is furnished with several appurtenances, as the *bars*, the *pins*, the *pawls*, the *swifter*, and the *saucer*, already described. The bars are long pieces of wood, or arms, thrust into a number of square holes in the drum-head all round, in which they are as the radii of a circle, or the spokes in the nave of a wheel. They are used to heave the capstern round, which is done by the men setting their breasts against them, and walking about, like the machinery of a horse-mill, till the operation is finished.—The pins *e*, are little bolts of iron thrust perpendicularly through the holes of the drum-head, and through a correspondent hole in the end of the bar, made to receive the pins when the bars are fixed. They are used to confine the bars, and to prevent them from working out as the men heave, or when the ship labours. Every pin is fastened to the drum-head with a small iron chain; and that the bars may exactly fit their respective holes, they are all numbered.—The pawls *f*, n° 1. are situated on each side the capstern, being two short bars of iron, bolted at one end through the deck to the beams close to the lower part of the whelps; the other end, which occasionally turns round on the deck, being placed in the intervals of the whelps, as the capstern turns round, prevents it from recoiling or turning back by any sudden jerk of the cable, as the ship rises on the sea, which might greatly endanger the men who heave. There are also hanging pawls *g*, n° 3. used for the same purposes, reaching from the deck above to the drum-head immediately below it. The swifter is a rope passed horizontally thro' holes in the outer end of the bars, and drawn very tight; the intent of this is to keep the men steady as they walk round when the ship rocks, and to give room for a greater number to assist by pulling upon the swifter itself.

The most frequent use of the capstern is to heave in the cable, and thereby remove the ship, or draw up the anchor. It is also used to wind up any weighty body, as the masts, artillery, &c. In merchant-ships it is likewise frequently employed to discharge or take in the cargo, particularly when consisting of weighty materials that require a great exertion of mechanical powers to be removed.

There are commonly two capsterns in a man of war, the *main* and the *gear* capstern; the former of which has two drum-heads, and may be called a *double one*. This is represented in n° 3. The latter is represented in n° 2.

Formerly the bars of the capstern went entirely thro' the head of it, and consequently were more than double the length of the present ones; the holes were therefore formed at different heights, as represented in n° 1. But this machine had several inconveniences, and has long been entirely disused in the navy. Some of these sort of capsterns, however, are still retained in merchant-ships, and are usually denominated *crabs*. The situation of the bars in a crab, as ready for heaving, is represented in n° 4.

Capsule,
Captain.

To Rig the CAPSTERN, is to fix the bars in their respective holes, and thrust in the pins, in order to confine them.—*Surge the CAPSTERN*, is the order to slacken the rope heaved round upon it, of which there are generally two turns and a half about the barrel at once, and sometimes three turns.—*To Heave the CAPSTERN*, is to go round with it heaving on the bars, and drawing in any rope of which the purchase is created.—*To Come-up the CAPSTERN*, is to let go the rope upon which they had been heaving.—*To Pawl the CAPSTERN*, is to fix the pawls to prevent it from recoiling during any pause of heaving.

CAPSULE, in a general sense, denotes a receptacle or cover in form of a bag.

CAPSULE, among botanists, a dry, hollow, seed-vessel, or pericarpium, that cleaves or splits in some determinate manner. See **PERICARPIMUM**.

This species of seed-vessel is frequently fleshy and succulent, like a berry, before it has attained maturity; but, in ripening, becomes dry, and often so elastic as to dart the seeds from their departments with considerable velocity. This elasticity is remarkably conspicuous in wood-forrel; balsam, *impatiens*; African spiræa, *dissona*; fraxinella; *justicia*; *ruellia*; *barleria*; *lathræa*; and many others.—The general aptitude or disposition of this species of seed-vessel to cleave or separate for the purpose of dispersing its seeds, distinguishes it not less remarkably than its texture from the pulpy or succulent fruits of the apple, berry, and cherry kind. This opening of the capsule for discharging its seeds when the fruit is ripe, is either at the top, as in most plants; at the bottom, as in triglochin; at the side through a pore, or small hole, as in campanula and orchis; horizontally, as in plantain, *amaranthus*, and *anagallis*; or longitudinally, as in convolvulus. All fruit that is jointed, opens at every one of the joints, each of which contains a single seed. Capsules, in splitting, are divided, externally, into one or more pieces, called by Linnæus, *valves*. The internal divisions of the capsules are called *cells*, *loculamenta*; these, in point of number, are exceedingly diversified; some having only one cell, as the primrose; and others many, as the water-lily. Hence a capsule is termed *unilocular*, *bilocular*, *trilocular*, &c. according as it has one, two, three, &c. cells or cavities.

CAPSULE Atrabiliarie, called also *glandule renales*, and *renes succenturiati*. See **ANATOMY**, n° 361.

CAPTAIN, a military officer, whereof there are several kinds, according to their commands.

CAPTAIN of a Troop or Company, an inferior officer who commands a troop of horse, or a company of foot, under a colonel. The duty of this officer is to be careful to keep his company full of able-bodied soldiers; to visit their tents and lodgings, to see what is wanting; to pay them well; to cause them keep themselves neat and clean in their cloaths, and their arms bright. He has power in his own company of making sergeants, corporals, and lanfepades.

In the horse and foot guards, the captains have the rank of colonels.

CAPTAIN-General, he who commands in chief.

CAPTAIN Lieutenant, he who with the rank of captain, but the pay of lieutenant, commands a troop or company in the name and place of some other person who is dispensed with on account of his quality from per-

Captain. performing the functions of his post.

Thus the colonel being usually captain of the first company of his regiment, that company is commanded by his deputy under the title of *captain lieutenant*.

So in England, as well as in France, the king, queen, dauphin, princes, &c. have usually the title of captain of the guards, *gens d'armes*, &c. the real duty of which offices is performed by captain-lieutenants.

CAPTAIN Reformed, one who, upon the reduction of the forces, has his commission and company suppressed; yet is continued captain, either as second to another, or without any post or command at all.

CAPTAIN of a Ship of War, the officer who commands a ship of the line of battle, or a frigate carrying 20 or more cannon. The charge of a captain in his majesty's navy is very comprehensive, in as much as he is not only answerable for any bad conduct in the military government, navigation, and equipment of of the ship he commands, but also for any neglect of duty or ill management in his inferior officers, whose several charges he is appointed to superintend and regulate.

On his first receiving information of the condition and quality of the ship he is appointed to command, he must attend her constantly, and hasten the necessary preparations to fit her for sea. So strict, indeed, are the injunctions laid on him by the lord high admiral, or commissioners of the admiralty, that he is forbid to lie out of his ship, from his arrival on board to the day of his discharge, unless by particular leave from the admiralty or from his commander in chief. He is enjoined to show a laudable example of honour and virtue to the officers and men; and to discountenance all dissolute, immoral, and disorderly practices, and such as are contrary to the rules of subordination and discipline; as well as to correct those who are guilty of such offences as are punishable according to the usage of the sea. He is ordered particularly to survey all the military stores which are sent on board, and to return whatever is deemed unfit for service. His diligence and application are required to procure his complement of men; observing carefully to enter only such as are fit for the necessary duty, that the government may not be put to unnecessary expence. When his ship is fully manned, he is expected to keep the established number of men complete, and superintend the muster himself if there is no clerk of the check at the port. When his ship is employed on a cruising station, he is expected to keep the sea the whole length of time previously appointed; but if he is compelled by some unexpected accident to return to port sooner than the time limited, he ought to be very cautious in the choice of a good situation for anchoring, ordering the master or other careful officers to found and discover the depths of water and dangers of the coast. Previous to any possibility of an engagement with the enemy, he is to quarter the officers and men to the necessary stations according to their office and abilities, and to exercise them in the management of the artillery, that they may be more expert in time of battle. His station in the time of an engagement, is on the quarter-deck: at which time he is expected to take all opportunities of annoying his enemy, and improving every advantage over him; to exhibit an example of courage and fortitude to his officers and crew; and to

place his ship opposite to his adversary in such a position as that every cannon shall do effectual execution. At the time of his arrival in port, after his return from abroad, he is to assemble his officers, and draw up a detail of the observations that have been made during the voyage, of the qualities of the ship as to her trim, ballast, stowage, manner of sailing, for the information and direction of those who may succeed him in the command: and this account is to be signed by himself and officers, and to be returned to the resident commissioner of the navy at the port where the ship is discharged.

CAPTAIN of a Merchant-ship, he who has the direction of the ship, her crew, and lading, &c. In small ships and short voyages, he is more ordinarily called the *master*. In the Mediterranean, he is called the *patron*.—The proprietor of the vessel appoints the captain or master; and he is to form the crew, and choose and hire the pilots, mates, and seamen; though, when the proprietor and master reside on the same spot, they generally act in concert together.

CAPTAIN Bashaw, or *Capodan Bashaw*, in the polity of the Turks, signifies the Turkish high admiral. He possesses the third office of the empire, and is invested with the same power at sea that the vizir has on shore. Soliman II. instituted this office in favour of the famous Barbarossa, with absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c. and at Constantinople, is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black-Sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and with the army.—The captain-bashaw enjoys two sorts of revenues; the one fixed, the other casual. The first arise from a capitation of the islands in the Archipelago, and certain governments in Naxos and Galipoli. The latter consist in the pay of the men who die during a campaign; in a fifth of all prizes made by the begs; in the profits accruing from the labour of the slaves, whom he hires as rowers to the grand signior; and in the contributions he exacts in all places where he passes.

CAPTION, in Scots law, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in a civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of the debtor until he pay the debt.

CAPTIVE, a slave, or a person taken from the enemy.

Formerly captives in war became the slaves of those who took them; and though slavery, such as obtained among the ancients, is now abolished, some shadow of it still remains in respect of prisoners of war, who are accounted the property of their captors, and have no right to liberty but by concession from them.—The Romans used their captives with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. Captives were frequently burnt in the funeral piles of the ancient warriors, as a sacrifice to the infernal gods. Those of royal or noble blood had their heads shaven,

Captain

Captive.

Captivity
||
Capuchins.

and their hair sent to Rome to serve as decorations for female toys, &c. They were led in triumph loaded with chains through Rome, in the emperor's train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the prime quality were honoured with golden chains on their hands and feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being carried in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY, in a general sense, the state or condition of a captive.

CAPTIVITY, in sacred history, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned six during the government of the judges; but the greatest and most remarkable were those of Judah and Israel, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerom are of this opinion: nevertheless, when we examine the writings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah: See Hosea i. 10, 11. Amos ix. 14. The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah: and from this period begins the 70 years captivity foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews boast that they have always had their heads or particular princes, whom they call *princes of the captivity*, in the east and west. The princes of the captivity in the east governed the Jews that dwelt in Babylon, Assyria, and Persia; and the princes of the captivity in the west governed those who dwelt in Judæa, Egypt, Italy, and in other parts of the Roman empire. He who resided in Judæa commonly took up his abode at Tiberias, and assumed the name of *Roshabbath*, "head of the fathers or patriarchs." He presided in assemblies, decided in cases of conscience, levied taxes for the expenses of his visits, and had officers under him who were dispatched through the provinces for the execution of his orders. As to the princes of the captivity at Babylon, or the east, we know neither the original nor succession of them. It only appears that they were not in being before the end of the second century.

CAPUA, (anc. geog.) a very ancient city of Italy, in Campania, and capital of that district. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannæ, and where Livy accuses him, but unjustly, of having enervated himself with pleasures *. It still retains the name, and is the see of an archbishop. It is seated on the river Vulturno, in E. Long. 15. 5. N. Lat. 41. 7.

CAPUCHINS, religious of the order of St Francis in its strictest observance; deriving their name from *capuce*, or *capuchon*, a stuff cap, or cowl, wherewith they cover their heads. They are clothed with brown, or grey; always bare-footed; are never to go in a coach, nor ever shave their beard.—The capuchins are a re-

form made from the order of minors, commonly called *cordeliers*, set on foot in the 16th century, by Matthew Baschi, a religious observant of the monastery of Montefalcone; who, being at Rome, was advertised several times from heaven, to practise the rule of St Francis to the letter. Upon this, he made application to pope Clement in 1525; who gave him permission to retire into a solitude, with as many others as chose to embrace the strict observance. In 1528, they obtained the pope's bull. In 1529, the order was brought into complete form; Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the capuchins by the pope: but in 1545, it was restored to them again with honour. In 1578, there were already 17 general chapters in the order of capuchins.

CAPUT LUPINUM. Anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like an wolf; by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him: yet now, to avoid such inhumanity, it is holden that no man is entitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.

CAPUT Mortuum, a Latin name given to fixed and exhausted residuums remaining in retorts after distillations. As these residuums are very different, according to the substances distilled, and the degree of heat employed, they are by the more accurate modern chemists particularly specified by adding a term denoting their qualities; as *earthy residuum*, *cherry residuum*, *saline residuum*, &c.

CARABINE, a fire-arm shorter than a musket, carrying a ball of 24 in the pound, borne by the light horse, hanging at a belt over the left shoulder. The barrel is two feet and an half long; and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, regiments of light horse, carrying longer carabines than the rest, and sometimes used on foot.

CARABUS, in zoology, a genus of insects belonging to the order of coleoptera, or the beetle kind. The feelers are bristly; the breast is shaped like a heart, and margined; and the elytra are likewise margined. There are 43 species of this genus, mostly distinguished by their colour. The most remarkable is the crepitans, or bombardier, with the breast, head, and legs, ferruginous or iron-coloured, and the elytra black. It keeps itself concealed among stones, and seems to make little use of its wings: when it moves, it is by a sort of jump; and whenever it is touched, one is surprised to hear a noise resembling the discharge of a musket in miniature, during which a blue smoke may be perceived to proceed from its anus. The insect may be made at any time to play off its artillery, by scratching its back with a needle. If we may believe Rolander, who first made these observations, it can give 20 discharges successively. A bladder placed near the anus is the arsenal whence it derives its store, and this is its chief defence against an enemy, although the smoke emitted seems to be altogether inoffensive, except it be by causing a fright, or concealing its course. Its chief enemy is another

Caput
||
Carabus.

* See
Carthage,
no 123.

another species of the same genus, but four times larger: when purfued and fatigued, the bombardier has recourfe to this stratagem, by lying down in the path of the large carabus, which advances with open mouth and claws to feize it; but, on the difcharge of this artillery, fuddenly draws back, and remains a while confuted: during which the bombardier conceals himfelf in fome neighbouring crevice; and if not happy enough to find one, the large carabus returns to the attack, takes the infect by the head, and tears it off.

CARACALLA (M. Antoninus Baffianus), emperor after his father Severus in 211, put the phyficians to death for not difpatching his father as he would have had them. He killed his brother Geta; and put Papinianus to death, becaufe he would not defend nor excufe his parricide. In fhort, it is faid that 20,000 perfons were maffacred by his order. He married Julia, his father's widow. Going to Alexandria, he flew the inhabitants, and applied to the magicians and astrologers. At laft, going from Edella to Mefopotamia, one of his captains flew him, by order of Macrinus, who fucceeded him. He died after he had reigned fomewhat more than fix years.

CARACCAS, a diftrict of Terra Firma in South America, belonging to the Spaniards. The coaft is rocky and mountainous, interperfed with fmall fertile valleys; fubjected at certain feafons of the year to dry north-weft winds, but bleffed in general with a clear air and wholefome climate. A very great illicit trade is carried on by the Englifh and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have fcouts perpetually employed, and breakworks raifed in all the valleys. A vaft number of cacao-trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fe confumes 20,000; Mexico a little more; the Canaries a fmall cargo; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called *Nirva*, into which they will not admit any white people. The chief town is likewife called *Caraccas*, and is fituated in N. Lat. 10. 10. Dampier fays it ftands at a confiderable diftance from the fea; is large, wealthy, and populous; and extremely difficult of access, by reafon of the fteep and craggy hills over which an enemy muft take his route. The commerce of this town, to which the bay of Guaira at two leagues diftance ferves for a harbour, was for a long time open to all the fubjects of the Spanifh monarchy, and is ftill fo to the Americans; but the Europeans are not fo well treated. In 1728 a company was formed at St Sebaftian, which obtained an exclufive right of maintaining connections with this part of the new world. Four or five fhips, which they difpatch every year, fail from thence, but they return to Cadiz.

CARACCI, (Lewis, Auguftin, and Hannibal), three celebrated painters of the Lombard fchool, all of Bologna. Lewis was born in 1555; and was coufin-german to Auguftin and Hannibal who were brothers, the fons of a taylor who was yet careful to give them a liberal education. They were both difciples of their coufin Lewis. Auguftin gained a knowledge of mathematics, natural philofophy, mufic, poetry, and moft of the liberal arts; but, though painting was his

principal purfuit, he learned the art of engraving from Cornelius Cort, and furpaffed all the mafters of his time. Hannibal, again, never deviated from his pencil.—Thefe three painters, at length, having reaped all the advantages they could by contemplation and practice, formed a plan of afociation, continued always together, and laid the foundation of that celebrated fchool which has ever fince been known by the name of *Caracci's academy*. Hither all the young ftudents, who had a view of becoming mafters, reforted to be inftructed in the rudiments of painting; and here the Caracci taught freely, and without referve, all that came. Lewis's charge was to make a collection of antique ftatues and bas-reliefs. They had defigns of the beft mafters, and a collection of curious books on all fubjects relating to their art; and they had a fkilful anatomift always ready to teach what belonged to the knitting and motions of the mufcles, &c. There were often difputations in the academy; and not only painters, but men of learned profefions, propofed queftions, which were always decided by Lewis. Every body was well received; and though ftated hours were allotted to treat of different matters, yet improvements might be made at all hours by the antiquities and the defigns which were to be feen.

The fame of the Caracci reaching Rome, the cardinal Farnefe fent for Hannibal thither, to paint the gallery of his palace. Hannibal was the more willing to go, becaufe he had a great defire to fee Raphael's works, with the antique ftatues and bas-reliefs. The gufto which he took there from the ancient fculpture, made him change his Bolognian manner for one more learned but lefs natural in the defign and in the colouring. Auguftin followed Hannibal, to affift him in his undertaking of the Farnefe gallery; but the brothers not rightly agreeing, Farnefe fent Auguftin to the court of the duke of Parma, where he died in the year 1602, being only 45 years of age. His moft celebrated piece of painting is that of the communion of St Jerom, in Bologna.

In the mean while, Hannibal continued working in the Farnefe gallery at Rome; and, after inconceivable pains and care, finifhed the paintings in the perfection in which they are now to be feen. He hoped that the cardinal would have rewarded him in fome proportion to the excellence of his work, and the time it took him up, which was eight years; but he was difappointed. The cardinal, influenced by an ignorant Spaniard his domeftic, gave him but a little above 200*l*. though it is certain he deferved more than twice as many thoufands. When the money was brought him, he was fo furprifed at the injuftice done him, that he could not fpeak a word to the perfon who brought it. This confirmed him in a melancholy to which his temper naturally inclined, and made him refolve never more to touch his pencil; which refolution he had undoubtedly kept, if his neceffities had not compelled him to break it. It is faid that his melancholy gained fo much upon him, that at certain times it deprived him of the ufe of his fenfes. It did not, however, put a flop to his amours; and his debauches at Naples, whither he had retired for the recovery of his health, brought a diftemper upon him of which he died in 1609, when he was 49 years of age. His veneration for Raphael was fo great, that it was his deathbed request to be buried in the fame

Caracci
||
Caract.

tomb with him; which was accordingly done, in the pantheon or rotunda at Rome. There are extant several prints of the blessed Virgin, and some other subjects etched by the hand of this incomparable artist. He is said to have been a friendly, plain, honest, and open-hearted man; very communicative to his scholars; and so extremely kind to them, that he generally kept his money in the same box with his colours, where they might have recourse to either as they had occasion.

While Hannibal Caracci worked at Rome, Lewis was courted from all parts of Lombardy, especially by the clergy, to make pictures in their churches; and we may judge of his capacity and facility, by the great number of pictures he made, and by the preference that was given him to other painters. In the midst of these employments, Hannibal solicited him to come and assist him in the Farnese gallery; and so earnestly, that he could not avoid complying with his request. He went to Rome; corrected several things in that gallery; painted a figure or two himself; and then returned to Bologna, where he died in 1619, aged 64.

CARACOL, in the menage, the half turn which an horseman makes, either to the right or left.—In the army, the horse always make a caracol after each discharge, in order to pass the rear of the Squadron.

CARACOL, in architecture, denotes a stair-case in a helix or spiral form.

CARACOLI, a kind of metal of which the Caribbees, or natives of the Lesser Antilles, make a sort of ornament in the form of a crescent, which they also call *caracoli*.—This metal comes from the main land; and the common opinion is, that it is a compound of silver, copper, and gold, something like the Corinthian brass among the ancients. These metals are so perfectly mixed and incorporated together, that the compound which results from them, it is said, has a colour that never alters, how long soever it remains in the sea or under ground. It is somewhat brittle; and they who work at it are obliged to mix a large proportion of gold with it, to make the compound more tough and malleable.

CARACT, or CARAT, the name of that weight which expresses the degree of fineness that gold is of. The word is also written, *caracti*, *carat*, *karact*, and *karrat*. Its origin is contested: But the most probable opinion is that of Kennet, who derives it from *carectia*, a term which anciently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold and the gravity of diamonds.

These carats are not real determinate weights, but only imaginary. The whole mals, be the weight what it will, is conceived to be divided into 24 carats; and as many 24th parts as it contains of pure gold, it is called *gold of so many carats*, or *so many carats fine*. Thus, gold of 18 carats is a mixt, of which 18 parts is pure gold, and the other six an inferior metal, &c. This is the common way of reckoning in Europe, and at the gold mines in the Spanish West Indies, but with some variation in the subdivision of the carat: among us, it is divided into four grains; among the Germans, into 12 parts; and by the French, according to Mr Hellot, into 32. The Chinese reckon by a different division called *touchers*, of which the highest number, or that which denotes pure gold, is 100; so that 100 touches

correspond to our 24 carats, &c.

CARACT is also a certain weight which goldsmiths and jewellers use wherewith to weigh precious stones and pearls.—In this sense, the word is by some supposed to be derived from the Greek *καρκαριον*, a fruit which the Latins call *filiqua*, and we *carob bean*; each of which may weigh about four grains of wheat, whence the Latin *filiqua* has been used for a weight of four grains. This caract weighs four grains, but they are something lighter than the grains of other weights. Each of these grains is subdivided in $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, &c.

CARACTACUS, a renowned king of the ancient British people called *Silures*, inhabiting South Wales. Having valiantly defended his country seven years against the Romans, he was at length defeated; and flying to Cartimunda, queen of the Brigantes (inhabitants of Yorkshire), was by her treacherously delivered up to the Romans, and led in triumph to the emperor Claudius then at York; where his noble behaviour, and heroic but pathetic speech, obtained him not only his liberty, but the esteem of the emperor, A. D. 52.

CARAGROUTH, in commerce, a silver coin of the empire, weighing nine drachms. It goes at Constantinople for 120 alpers. There are four sorts of them, which are all equally current and of the same value.

CARAITES, in the ecclesiastical history of the Jews, a religious sect among that people, who adhere closely to the text and letter of the Scriptures, rejecting the rabbinical interpretations and the cabala. The Caraites pass for the most learned of the Jewish doctors. They are chiefly to be met with in Poland, Muscovy, and the East; and are but few in comparison of the bulk of the Jews who are of the party of the rabbins. The latter have so great an aversion to the Caraites, that they will have no alliance or even conversation with them: they treat them as bastards; and would a Carait turn rabbinist, the other Jews would not receive him.

CARAMANIA, a considerable province of Turkey, in Asia, in the south part of Natolia. Bajazet united this province to his empire about the year 1488, and since that time it has continued in the possession of the Turks. Satalia was the capital city, but is now much decayed.

CARAMANTA, a town of South America, and capital of a province of the same name in Terra Firma, and in the audience of Santa Fe. W. Long. 72. 35. N. Lat. 5. 18. The province of Caramanta is extended on both sides the river Cauca; and is bounded on the N. by the district of Carthagen, on the E. by New Granada, on the S. by Popayan, and on the W. by Popayan and by the audience of Panama. It is a valley surrounded on every side by very high mountains.

CARANNA, or KARANNA, a very scarce gum which comes from New Spain. It is said to possess many extraordinary medical virtues, but the present practice takes no notice of it.

CARANUS, the first king of Macedon, and the seventh of the race of the Heracleides. See MACEDONIA.

CARAT. See CARACT.

CARAVAGGIO (Michael Angelo da), a celebrated painter, born at Caravaggio, a village in Milan, in 1596. He was at first only a day-labourer: but having seen some painters at work upon a wall which he helped

Caract
||
Caravaggio.

Caravaggio,
Caravan.

helped to raise, he was so charmed with their art, that he applied to the study of it; and made so considerable a progress in a few years, that he was admired at Rome, Venice, and other parts of Italy, as the author of a new style in painting. Upon his first going to Rome, he was compelled by his necessities to paint flowers and fruit, under Gioseppino; but growing tired of that subject, and returning to histories, he made use of a method quite different from that of Gioseppino, and followed nature as much too closely as the other departed from her, by imitating her defects as well as her beauties. Thus cramping his invention, he understood but little either of design or decorum in his compositions: he had however as good a gusto in colouring as he had a bad one in design. His pieces are to be found in most of the cabinets of Europe; and there is a picture of his drawing in the Dominican church at Antwerp, which Rubens used to call his *master*.

CARAVAN, or KARAVANNE, in the east, signifies a company or assembly of travellers and pilgrims, and more particularly of merchants, who, for their greater security, and in order to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arabs or robbers.

There are four regular caravans which go yearly to Mecca; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, for the Mahometans of Barbary; the third from Zibith, a place near the mouth of the Red Sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble.—Most of the inland commerce of the East is carried on by caravans. The late czar Peter the Great, established a trade between Russia and China by means of a caravan. M. Bignon, geographer to the duke of Lorraine, has given a treatise of the caravans of merchants in Asia; wherein he shews of what they are composed, how many forts there are, the several uses of the different sorts of animals in them; the prices given for them, the officers and men appointed to conduct them, and the pay of each, with their manner of marching, halting, fighting, retreating, &c.—Caravans of this kind are large convoys of armed men, merchants, and travellers, with divers sorts of animals for the carriage of their provisions. There are commonly four chief officers of a caravan, *viz.* the *caravan bachi*, or chief; the captain-guide; captain of rest; and captain of distribution. The first has absolute command over all the rest: the second is absolute in the march: the office of the third only commences when the caravan stops and makes a stay: to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c. to take care of at their own peril. The treasurer of the caravan makes a fifth officer, who has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of those concerned in fitting out the caravan.

Any dealer is at liberty to form a company, in order to make a caravan. He in whose name it is raised, is considered as the *caravan bachi*, or chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they e-

lect a *caravan bachi*; after which, they appoint officers to conduct the caravan and decide all controversies that may arise during the journey.

There are also sea caravans; established on the same footing, and for the same purposes: such is the *caravan of vessels*, from Constantinople to Alexandria.

CARAVANSERA, or KARAVANSERA, a place appointed for receiving and loading the caravans.

It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up their lodgings as well as they can; the beasts of burden being tied to the foot of the bank. Over the gates, that lead into the court, there are sometimes little rooms, which the keepers of the caravanseras let out at a very high price to such as have a mind to be private.

The caravanseras in the East are something of the nature of the inns in Europe; only that you meet with little accommodation either for man or beast, but are obliged to carry almost every thing with you: there is never a caravanera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans; they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there.—There are also caravaneras where most things may be had for money; and as the profits of these are considerable, the magistrates of the cities to whose jurisdiction they belong, take care to store them well. There is an inspector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal.

CARAVANSERASKIER, the steward or keeper of a CARAVANSERA.—He keeps an account of all the merchandises that are sold upon trust, and demands the payments of the sums due to the merchants for what has been sold in the caravanera, on the seller's paying two per cent.

CARAWAY, in botany. See CARUM.

CARBONADE, or CARBONADO, in cookery; flesh, fowl, or the like, seasoned, and broiled on the coals.

CARBUNCLE, in natural history, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of *anthrax*. It is usually found pure and faultless, and is of the same degree of hardness with the sapphire: it is naturally of an angular figure; and is found adhering, by its base, to a heavy and ferruginous stone of the emery kind: its usual size is near a quarter of an inch in length, and two thirds of that in diameter in its thickest parts: when held up against the sun, it loses its deep tinge, and becomes exactly of the colour of a burning charcoal, whence the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is found only in the East Indies, so far as is yet known; and there but very rarely.

CARBUNCLE, or *anthrax*, in medicine, an inflammation which arises, in time of the plague, with a vesicle or blister almost like that produced by burning.

CARBUNCLE, in heraldry, a charge or bearing, consisting

Caravanfera
||
Carbuncle.

sifting of eight radii, four whereof make a common cross, and the other four a saltier.

Some call these radii *buttons*, or *flaves*, because round, and enriched with buttons, or pearly like pilgrims flaves, and frequently tipped or terminated with flower-de-luces; others blazon them, royal sceptres, placed in saltier, pale and fesse.

CARCASSE, or **CARCUSSE**, in the art of war, an iron-cage, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal-powder, saltpetre, sulphur, broken glass, shavings of horn, turpentine, tallow, &c. It has two or three apertures out of which the fire is to blaze; and the design of it is to be thrown out of a mortar, to set houses on fire, and do other execution. It has the name *carcaffé*, because the circles which pass from one ring or plate to the other seem to represent the ribs of a human carcass.

CARCASSONE, an ancient city of France, in Lower Languedoc, with a bishop's see. It is divided into the upper and lower town. They are both surrounded with walls; and though their situations are different, they are both watered by the river Aude. The upper town is seated on a hill, with a castle that commands it, as well as the lower town. It is strong, not only by its situation on a craggy rock, but also by several large towers which are joined to its walls, and which render it of difficult access. The cathedral church is remarkable for nothing but its antiquity. The lower town is large, and built after the modern taste. The streets are very straight; and lead to a large square in the middle, from whence may be seen the four gates of the town. There is here a manufacture of cloth. The neighbouring country is full of olive-trees; and in the mountains there a fine marble, commonly called *marble of Languedoc*. E. Long. 2. 25. N. Lat. 43. 11.

CARCERES, in the ancient Circenian games, were inclosures in the circus, wherein the horses were restrained till the signal was given for starting, when, by an admirable contrivance, they all at once flew open.

CARCINOMA, in medicine; the same with **CANCER**.

CARD, among artificers, an instrument consisting of a block of wood, beset with sharp teeth, serving to arrange the hairs of wool, flax, hemp, and the like: there are different kinds of them, as hand-cards, stock-cards, &c. They are made as follows.

A piece of thick leather, of the size intended for the card, is strained in a frame for that purpose; and then pricked full of holes, into which the teeth or pieces of iron wire are inserted. After which the leather is nailed by the edges to a flat piece of wood, in the form of an oblong square, about a foot in length, and half a foot in breadth, with a handle placed in the middle of one of the longer sides.

The teeth are made in the following manner. The wire being drawn of the size intended, a skain or number of wires are cut into proper lengths by means of a gauge, and then doubled in a tool contrived for that purpose: after which they are bent into the proper direction by means of another tool; and then placed in the leather, as mentioned above.

CARDS, among gamblers, little pieces of fine thin pasteboard of an oblong figure, of several sizes; but

most commonly, in Britain, three inches and an half long, and two and an half broad, on which are painted several points and figures.

The moulds and blocks for making cards are exactly like those that were used for the first printed books. They lay a sheet of wet or moist paper on the block, which is first slightly done over with a sort of ink made of lamp-black diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, styled *flame-files*. These consist of papers cut through with a penknife; and in these apertures, they apply severally the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they slightly pass over it a brush-full of colour, which, leaving it within the openings, forms the face or figure of the card.

Among sharps, divers sorts of false and fraudulent cards have been contrived; as, 1. *Marked cards*, where the aces, kings, queens, knaves, are marked on the corners of the backs with spots of different number and order, either with clear water or water tinged with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally; kings with two spots at the same corners; knaves with the same number transversed. 2. *Brief cards*, those which are longer or broader than the rest; chiefly used at whist and piquet. The broad cards are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cutting, to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the person unacquainted with the fraud to cut them favourably for the sharper. As the pack is placed either endwise or sidewise to him that is to cut, the long or broad cards naturally lead him to cut to them. Brief cards are sometimes made thus by the manufacturer; but, in defect of these, sharps pare all but the breves with a penknife or razor. 3. *Corner bend*, denotes four cards turned down finely at one corner, to serve as a signal to cut by. 4. *Middle bend*, or Kingston-bridge, is where the tricks are bent two different ways, which causes an opening or arch in the middle, to direct likewise the cutting.

Cards were invented about the year 1390, to divert Charles VI. of France, who had fallen into a melancholy disposition. The inventor proposed, by the figures of the four suits or colours, as the French call them, to represent the four classes of men in the kingdom. By the *cœurs* (hearts) are meant the *gens de coeur*, choir-men, or ecclesiastics; and therefore the Spaniards, who certainly received the use of cards from the French, have *copas*, or chalices, instead of hearts. The nobility, or prime military part of the kingdom, are represented by the ends or points of lances or pikes; and our ignorance of the meaning or resemblance of the figure induced us to call them *spades*: The Spaniards have *espadas*, swords, in lieu of pikes, which are of similar import. By diamonds are designed the order of citizens, merchants, or tradesmen, *carreaux*, (square stones, tiles, or the like): The Spaniards have a coin, *dincros*, which answers to it; and the Dutch call the French word *carreaux* "*Arreuen*," stones and diamonds, from the form. *Trefle*, the trefoil-leaf, or clover-grass

grafs (corruptly called *clubs*), alludes to the husbandmen and peasants. But how this suit came to be called *clubs*, is not easily explained; unless, borrowing the game from the Spaniards, who have *kister* (Raves or clubs) instead of the trefoil, we give the Spanish signification to the French figure.

The history of the four kings, which the French, in drollery, sometimes call the *cards*, are David, Alexander, Cæsar, and Charles; which names were then, and still are, on the French cards. These respectable names represent the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. By the queens are intended Argine, Esther, Judith, and Pallas, (names retained in the French cards), typical of birth, piety, fortitude, and wisdom, the qualifications residing in each person. *Argine* is an anagram for *regina*, queen by descent. By the knaves were designed the servants to knights, (for *knave* originally meant only *servant*); but French pages and valets, now indiscriminately used by various orders of persons, were formerly only allowed to persons of quality, esquires (*escuires*) shield or armour bearers. Others fancy that the knights themselves were designed by those cards; because Hogiere and Lahire, two names on the French cards, were famous knights at the time cards were supposed to have been invented.

Deceptions wit CARDS. See LEGERDEMAIN, &c. l. i.

CARDAMINE, LADIES-SMOCK; a genus of the filifolia order, belonging to the tetradynamia class of plants. Of this there are 15 species; but the most remarkable is the *pratensis*, with a large purplish flower. This grows naturally in many parts of Britain, and is also called *cuckoo-flower*. There are four varieties, viz. the single, with purple and white flowers, which are frequently intermixed in the meadows; and the double, of both colours. The single sorts are not admitted into gardens; but the double deserve a place, as making a pretty appearance during the time they are in flower. They will thrive in a moist shady border; and are propagated by parting their roots, which is best performed in autumn. They delight in a soft loamy soil, not too stiff. By some the plant is reckoned antiscorbutic.

CARDAMOM, in the Materia Medica. See AMOMUM; and MATERIA MEDICA, n° 210, 211.

CARDAN (Jerom), one of the most extraordinary geniuses of his age, was born at Pavia on the 24th of September 1501. As his mother was not married, she tried every method to procure an abortion, but without effect. She was three days in labour, and they were at last obliged to cut the child from her. He was born with his head covered with black curled hair. When he was four years old, he was carried to Milan; his father being an advocate in that city. At the age of 20, he went to study in the university of that city; and two years afterwards, he explained Euclid. In 1524, he went to Padua; and the same year he was admitted to the degree of master of arts: in the end of the following year, he took the degree of doctor of physic. He married about the year 1531. For ten years before, his impotency had hindered him from having knowledge of a woman; which was a great mortification to him. He attributed it to the evil influences of the planet under which he was born. When he enumerates, as he frequently does, the greatest misfortunes of his life, this ten years impotency is always one. At

the age of 33, he became professor of mathematics at Milan. In 1539, he was admitted member of the college of physicians at Milan; in 1543, he read public lectures of medicine in that city, and at Pavia the year following; but discontinued them because he could not get payment of his salary, and returned to Milan. In 1552, he went into Scotland, having been sent for by the archbishop of St Andrews, who had in vain applied to the French king's physicians, and afterwards to those of the emperor of Germany. This prelate, then 40 years old, had for ten years been afflicted with a shortness of breath, which returned every eight days for the two last years. He began to recover from the moment that Cardan prescribed for him. Cardan took his leave of him at the end of six weeks and three days, leaving him prescriptions which in two years wrought a complete cure.

Cardan's journey to Scotland gave him an opportunity of visiting several countries. He crossed France in going thither; and returned through Germany, and the Low Countries, along the banks of the Rhine. It was on this occasion he went to London and calculated king Edward's nativity. This tour took up about four months: after which, coming back to Milan, he continued there till the beginning of October 1552; and then went to Pavia, from whence he was invited to Bologna in 1562. He taught in this last city till the year 1570; at which time he was thrown into prison; but some months after, he was sent home to his own house. He left Bologna in 1571; and went to Rome, where he lived for some time without any public employment. He was, however, admitted a member of the college of physicians, and received a pension from the Pope. He died at Rome on the 21st of September 1575, according to Thuanus. This account might be sufficient to show the reader that Cardan was of a very fickle temper; but he will have a much better idea of his singular and odd turn of mind by examining what he himself has written concerning his own good and bad qualities. He paid himself congratulatory compliments for not having a friend in this world; but that, in requital, he was attended by anaërial spirit, emanated partly from Saturn and partly from Mercury, who was the constant guide of his actions, and teacher of every duty to which he was bound. He declared too, that he was so irregular in his manner of walking the streets, as induced all beholders to point at him as a fool. Sometimes he walked very slowly, like a man absorbed in profound meditation; then all on a sudden quickened his steps, accompanying them with very absurd attitudes. In Bologna his delight was to be drawn about in a mean vehicle with three wheels. When nature did not visit him with any pain, he would procure to himself that disagreeable sensation by biting his lips so wantonly, or pulling his fingers to such a vehement degree, as sometimes to force the tears from his eyes: and the reason he assigned for so doing, was to moderate certain impetuous sallies of the mind, the violence of which was to him by far more insupportable than pain itself; and that the sure consequence of such a severe discipline was the enjoying the pleasure of health. He says elsewhere, that, in his greatest tortures of soul, he used to whip his legs with rods, and bite his left arm; that it was a great relief to him to weep, but that very often he could not;

that

Cardan.

that nothing gave him more pleasure than to talk of things which made the whole company uneasy; that he spoke on all subjects, in season and out of season; and he was so fond of games of chance, as to spend whole days in them, to the great prejudice of his family and reputation, for he even flaked his furniture and his wife's jewels.

Cardanus makes no scruple of owning that he was revengeful, envious, treacherous, a dealer in the black art, a backbiter, a calumniator, and addicted to all the foul and detestable excesses that can be imagined; yet, notwithstanding (as one would think) so humbling a declaration, there was never perhaps a vainer mortal, or one that with less ceremony expressed the high opinion he had of himself, than Cardanus was known to do, as will appear by the following proofs. "I have been admired by many nations; an infinite number of panegyrics, both in prose and verse, have been composed to celebrate my fame. I was born to release the world from the manifold errors under which it groaned. What I have found out could not be discovered either by my predecessors or my contemporaries; and that is the reason why those authors who write any thing worthy of being remembered, scruple not to own that they are indebted to me for it. I have composed a book on the dialectic art, in which there is neither one superfluous letter nor one deficient. I finished it in seven days, which seems a prodigy. Yet where is there a person to be found, that can boast of his having become master of its doctrine in a year? And he that shall have comprehended it in that time, must appear to have been instructed by a familiar demon."

The same capriciousness observable in his outward conduct is to be observed in the composition of his works. We have a multitude of his treatises in which the reader is stopped almost every moment by the obscurity of his text, or his digressions from the point in hand. In his arithmetical performances there are several discourses on the motions of the planets, on the creation, and on the tower of Babel. In his dialectic work, we find his judgment on historians and the writers of epistles. The only apology which he makes for the frequency of his digressions is, that they were purposely done for the sooner filling up of his sheet, his bargain with the bookseller being at so much per sheet; and that he worked as much for his daily support, as for the acquisition of glory. The Lyons edition of his works, printed in 1663, consists of ten volumes in folio.

It was Cardanus who revived in latter times all the secret philosophy of the Cabbala or Cabbalists, which filled the world with spirits; a likeness to whom, he asserted, we might attain by purifying ourselves with philosophy. He chose for himself, however, notwithstanding such reveries, this fine device, *Tempus mea possessio, tempus meus ager*: "Time is my sole possession, and the only fund I have to improve."

In fact, when we consider the transcendent qualities of Cardan's mind, we cannot deny his having cultivated it with every species of knowledge, and his having made a greater progress in philosophy, in the medical art, in astronomy, in mathematics, &c. than the greatest part of his contemporaries who had applied their minds but to one of those sciences.

Scaliger affirms, that Cardan, having fixed the time

of his death, abstained from food, that his prediction might be fulfilled, and that his continuance to live might not discredit his art. Cardan's father, who was a doctor of medicine, and a professor of civil and canon law, died in the same manner, in the year 1524, having abstained from all sustenance for nine days. His son tells us, that he had white eyes, and could see in the night-time.

CARDIAC, in a general sense, signifies all medicines beneficial to the heart, whether internally or externally applied. The word comes from the Greek word *καρδια*, *cor*; the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits, and give present strength and cheerfulness; these amount to the same with what are popularly called *cordials*. Cardiacs are medicines anciently supposed to exert themselves immediately in comforting and strengthening the heart: but the modern physicians rather suppose them to produce the effect by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated, and the tone and elasticity of the fibres of the vessels restored; the consequence of which is a more easy and brisk circulation.

CARDIALGIA, in medicine, a violent sensation of heat or acrimony felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitations of the heart, fainting, and a propensity to vomit: better known by the name of *cardiac passion*, or *heart-burn*. See (*Index subjoined to*) MEDICINE.

CARDIFF, a town of Glamorganshire, in South Wales, seated on the river Tawe, in a rich and fruitful soil. It is a large, compact, well-built town, having a castle, a wall, and four gates, built by Robert Fitz-Hamon, a Norman, about the year 1100. It is governed by the constable of the castle, 12 aldermen, 12 burgesses, &c. and sends one member to parliament. Here the assizes and sessions are held, besides several courts. There is a handsome bridge over the river, to which small vessels come to take in their lading. It has now only one church, St Mary's having been long since thrown down by the undermining of the river. The castle, though much decayed, makes a grand appearance even at this time; and the walls of the town are very strong and thick. The church has a fine tower-skeele, and the town-hall is a good structure. The magistrates are elected every year by the majority of the burgesses. W. Long. 3. 20. N. Lat. 51. 30.

CARDIGAN, the capital town of Cardiganshire, in South Wales, is seated near the mouth of the river Teivy, on the Irish channel. It is indifferently large and well-built, containing three wards, one church, and the county-goal. It is governed by a mayor, 13 aldermen, 13 common-council-men, &c. Here are the ruins of a castle which was built by Gilbert de Clare, about the year 1160. It sends one member to parliament; and has two markets, held on Tuesdays and Saturdays. W. Long. 4. 38. N. Lat. 52. 15.

CARDIGANSHIRE, a county of South Wales, bounded on the north by Merionethshire and Montgomeryshire, on the east by Radnorshire and Brecknockshire, on the west by the Irish Sea, and on the south by Caermarthenshire. Its length from north-west

Cardiac
||
Cardigan-
shire.

Cardinal.

to south-east is about 44 miles, and its breadth near 20. The air, as in other parts of Wales, varies with the foil, which in the southern and western parts is more upon a level than this principality generally is, which renders the air mild and temperate. But as the northern and eastern parts are mountainous, they are consequently more barren and bleak. However, there are cattle bred in all parts; but they have neither wood nor coals of their own for fuel: they have rich lead mines, and fish in plenty, with fowls both tame and wild. The principal rivers are the Teivy, the Ridol, and the Iſtwith. This county hath five market-towns, *viz.* Cardigan, Aberistwith, Llanbadarnvawu, Llanbedar, and Tregaron, with 77 parishes; and was formerly computed to have upward of 3000 houses, and 520,000 acres of land. It sends two members to parliament; one for the county, and one for Cardigan.

CARDINAL, in a general sense, an appellation given to things on account of their pre-eminence; thus we say *cardinal virtues*, &c.

CARDINAL *Signs*, in the zodiac, are Aries, Libra, Cancer, and Capricorn.

CARDINAL *Points*, in cosmography, are the east, west, north, and south.

CARDINAL, an ecclesiastical prince in the Romish church, being one who has a voice in the conclave at the election of a pope. The cardinals were originally no more than deacons, to whom was intrusted the care of distributing the alms to the poor in the several quarters of Rome: and as they held assemblies of the poor in certain churches of their several districts, they took the title of these churches. They began to be called *cardinals* in the year 300, during the pontificate of St Sylvester, by which appellation was meant the chief priests of a parish, and next in dignity to a bishop. This office grew more considerable afterwards, and by small degrees arrived at its present height, in which it is the reward of such as have served his holiness well, even princes thinking it no diminution of their honour to become members of the college of cardinals.

The cardinals compose the pope's council, and till the time of Urban VIII. had the title of the *most illustrious*; but by a decree of that pope, in 1630, they had the title of *eminence* conferred on them.

At the creation of a new cardinal, the pope performs the ceremony of opening and shutting his mouth, which is done in a private confistory. The shutting his mouth implies the depriving him of the liberty of giving his opinion in congregations; and the opening his mouth, which is performed 15 days after, signifies the taking off this restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The cardinals are divided into six orders or classes, consisting of six bishops, 50 priests, and 14 deacons, making in all 70; which constitute the sacred college. The number of cardinal-bishops has very seldom been changed, but that of priests and deacons has varied at different times.

The privileges of cardinals are very great. They have an absolute power in the church during the vacancy of the holy see: they have a right to elect the new pope, and are the only persons on whom the election can fall:

most of the grand offices in the court of Rome are filled by cardinals. The dress of a cardinal is a red tunic, a rocket, a short purple mantle, and the red hat. When they are sent to the courts of Princes, it is in quality of legates *a latere*; and when they are appointed governors of towns, their government is called by the name of *legation*.

CARDINAL is also a title given to some bishops, as those of Mentz and Milan, to the archbishop of Bourges; and the abbot of Vendome calls himself *cardinalis natus*.

CARDINAL'S *Flower*. See RAPUNTUM.

CARDIOID, in the higher geometry, an algebraical curve, so called from its resemblance to an heart.

CARDIOSPERMUM, HEART-PEA; a genus of the trigynia order, belonging to the octandria class of plants. There are two species, both natives of the East and West Indies; but have no great beauty, or any other remarkable property.

CARDIUM, or COCKLE, in zoology, a genus of insects belonging to the order of vermes testacea. The shell consists of two equal valves, and the sides are equal. There are 21 species of this genus. Common on all sandy coasts, lodged a little beneath the sand; their place marked by a depressed spot. They are wholesome and delicious food.

CARDONA, a handsome town of Spain, in Catalonia, with a strong castle, and the title of a duchy. Near it is an inexhaustible mountain of salt of several colours, as red, white, carnation, and green: but when washed, it becomes white. There are also vineyards which produce excellent wine, and very lofty pine-trees. It is seated on an eminence, near the river Cardenero. E. Long. 1. 26. N. Lat. 41. 42.

CARDUUS, the THISTLE; a genus of the polygama æqualis order, belonging to the syngenesiæ class of plants. Of this genus there are 26 species, ten of which are natives of Britain, and being troublesome weeds require no description. Some few of the exotic kinds are propagated in gardens for the sake of variety; but even these have neither beauty nor any other property to recommend them.

CARDUUS *Benedictus*. See Cnicus.

CAREENING, in the sea-language, the bringing a ship to lie down on one side, in order to trim and caulk the other side. See Plate LXXXIV. fig. 2.

A ship is said to be brought to the careen, when the masts of her lading being taken out, she is hulled down on one side, by a small vessel, as low as necessary; and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be trimmed, seams caulked, or any thing that is faulty under water mended. Hence when a ship lies on one side when the sails, she is said to fail on the careen.

CAREER, in the menage, a place inclosed with a barrier, wherein they run the ring.

The word is also used for the race or course of the horse itself, provided it do not exceed 200 paces.

In the ancient circus, the career was the space the bigæ, or quadrigæ, were to run at full speed, to gain the prize. See CIRCUS.

CAREER, in falconry, is a flight or tour of the bird, about 120 yards. If the mount more, it is called a *double career*; if less, a *semi-career*.

Cardinal
||
Crecer.

CARELIA, the eastern province of Finland; divided into Swedish Carelia, and Muscovite Carelia. The capital of the latter is Povenza, and of the former Weiburg.

CARELSCROON, a sea-port town of Sweden, in Blekingia, or Bleking, on the Baltic Sea, with a very good harbour, defended by two forts. It was built in 1679; and is very populous, with arsenals for the marine: the house of the director-general of the admiralty is in this town, and here the Swedes lay up their royal navy. E. Long. 15. 5. N. Lat. 56. 15.

CARENTAN, a town of France in Lower Normandy, and in the Contentin, with an ancient castle. W. Long. 1. 14. N. Lat. 49. 20.

CARET, among grammarians, a character marked thus A, signifying that something is added on the margin, or interlined, which ought to come in where the caret stands.

CAREW (George), born in Devonshire in 1557, an eminent commander in Ireland, was made president of Munster by queen Elizabeth; when, joining his forces with the earl of Thomond, he reduced the Irish insurgents, and brought the earl of Desmond to his trial. King James made him governor of Guernsey, and created him a baron. As he was a valiant commander, he was no less a polite scholar; and wrote *Pacata Hibernia*, a history of the late wars in Ireland, printed after his death, in 1633. He made several collections for a history of Henry V. which are digested into Speed's History of Great Britain. Besides these, he collected materials of Irish history in four large MSS. volumes, now in the Bodleian library, Oxford.

CAREW (Thomas), descended from the family of Carew in Gloucestershire, was gentleman of the privy chamber to Charles I. who always esteemed him one of the most celebrated wits of his court. He was much respected by the poets of his time, particularly by Ben Johnson, and Sir William Davenant; and left behind him several poems, and a masque called *Colum Britannicum*, performed at Whitehall on Shrove Tuesday night, 1633, by the king, and several of his nobles with their sons. Carew was assisted in the contrivance by Inigo Jones, and the music was set by Mr Henry Lawes of the king's chapel. He died in the prime of life, about the year 1639.

CARGADORS, a name which the Dutch give to those brokers whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

CARGAPOL, or **KARGAPOL**, the capitol of a territory of the same name, in the province of Dwina, in Muscovy: E. Long. 36°. N. Lat. 63°.

CARGO denotes all the merchandises and effects which are laden on board a ship.

Super-CARGO, a person employed by merchants to go a voyage, oversee the cargo, and dispose of it to the best advantage.

CARIATI, a town of Italy, in the kingdom of Naples, and province of Hither Calabria, with a bishop's see, and the title of a principality. It is two miles from the gulph of Taranto, and 37 north-east of Cosenza. E. Long. 17. 19. N. Lat. 30. 38.

CARIBBEE ISLANDS, a cluster of islands situated

in the Atlantic ocean between 59 and 63 degrees of west longitude, and between 11 and 18 degrees of north latitude. They lie in the form of a bow or femicircle, stretching almost from the coast of Florida north, to near the river Oroonoque. Those that lie nearest the east have been called the *Windward Islands*, the others the *Leeward*, on account of the winds blowing generally from the eastern point in those quarters. Abbé Raynal conjectures them to be the tops of very high mountains formerly belonging to the continent, which have been changed into islands by some revolution that has laid the flat country under water. The direction of the Caribbee islands, beginning from Tobago, is nearly north and N. N. W. This direction is continued, forming a line somewhat curved towards the north-west, and ending at Antigua. In this place the line becomes at once curved; and, extending itself in a straight direction to the west and north-west, meets in its course with Porto-Rico, St Domingo, and Cuba, known by the name of the *Leeward Islands*, which are separated from each other by channels of various breadths. Some of these are six, others 15 or 20 leagues broad; but in all of them the soundings are from 100 to 120 or 150 fathom. Between Granada and St Vincent there is also a small archipelago of 30 leagues, in which the soundings are not above ten fathom. The mountains in the Caribbee islands run in the same direction as the islands themselves. The direction is so regular, that if we were to consider the tops of these mountains only, independent of their bases, they might be looked upon as a chain of hills belonging to the continent, of which Martinico would be the most northerly promontory. The springs of water which flow from the mountains in the Windward Islands, run all in the western parts of these islands. The whole eastern coast is without any running water. No springs come down there from the mountains: and indeed they would have there been useless; for after having run over a very short tract of land, and with great rapidity, they would have fallen into the sea. In Porto Rico, St Domingo, and Cuba, there are a few rivers that discharge themselves on the northern side, and whose sources rise in the mountains running from east to west, that is, thro' the whole length of these islands. From the other side of the mountains facing the south, where the sea, flowing with great impetuosity, leaves behind it marks of its inundations, several rivers flow down, the mouths of which are capable of receiving the largest ships. The soil of the Caribbees consists mostly of a layer of clay or gravel of different thickness; under which is a bed of stone or rock. The nature of some of those soils is better adapted to vegetables than others. In those places where the clay is drier and more friable, and mixes with the leaves and remains of plants, a layer of earth is formed of greater depth than where the clay is moister. The sand or gravel has different properties according to its peculiar nature; wherever it is less hard, less compact, and less porous, small pieces separate themselves from it, which, though dry, preserve a certain degree of coolness useful to vegetation. This soil is called in America, a *pumice-stone* soil. Wherever the clay and gravel do not go through such modifications, the soil becomes barren, as soon as the layer formed by the decomposition of the original plants is destroyed.

When the Europeans landed on the Caribbee islands, they

Caribbee.

they found them covered with large trees, connected as it were to one another by a species of creeping plant, which, rising up in the same manner as the ivy, wove itself around all the branches, and concealed them from sight. There was so great plenty of this plant, and it grew so thick, that it was impossible to penetrate into the woods before it was cut down. In these forests there were varieties of trees that were exceeding lofty, very straight, and without any excrescences or defects. The annual fall and breaking down of the leaves of those trees, and the decay of their trunks thro' length of time, formed a moist sediment upon the ground, and occasioned a most surprising degree of vegetation when the trees were rooted up. In whatever soil these trees grew, their roots were seldom two feet deep, and very often less, though they extended themselves on the surface in proportion to the weight they had to support. The trees that grew on the tops of mountains, or in steep places, were very hard. Their bark was smooth, and firmly fixed to the wood. Several of them hardly yielded to the sharpest instrument, and it was necessary to burn them in order to root them up. The valleys abounded with soft wood; and at the foot of these, an infinite variety of plants, some of which were used by the natives for food.—We need not here recount the particulars already mentioned under the article AMERICA, concerning the indolent and savage life of the inhabitants of these islands; nor give a detail of their reduction by the Spaniards and other European powers, which falls to be mentioned under the name of each particular island; but shall here only observe, that by a treaty concluded in January 1660, between the French and English, the Caribs were confined to the islands of St Vincents and Dominica, where all the scattered body of this people were united, and at that time did not exceed in number 6000 men.

As the Caribbee islands are all between the tropics, their inhabitants are exposed, allowing for the varieties resulting from difference of situation and soil, to a perpetual heat, which generally increases from the rising of the sun till an hour after noon, and then declines in proportion as the sun declines. The variations of the temperature of the air seem to depend rather on the wind than on the changes of the seasons. In those places where the wind does not blow, the air is excessively hot, and none but the easterly winds contribute to temper and refresh it: those that blow from the south and west, afford little relief; but they are much less frequent and less regular than that which blows from the east. The branches of the trees exposed to the influence of the latter are forced round towards the west: but their roots are stronger, and more extended under the ground, towards the east than towards the west; and hence they are easily thrown down by strong west winds or hurricanes from that quarter. The easterly wind is scarce felt in the Caribbee islands before 9 or 10 o'clock in the morning, increases in proportion as the sun rises above the horizon, and decreases as it declines. Towards the evening it ceases entirely to blow on the coasts, but not on the open sea. It has also been observed, that it blows with more force, and more regularity, in the dog-days than at any other time of the year.

The rain also contributes to the temperature of the Caribbee islands, though not equally in them all. In

Caribbee.

those places where the easterly wind meets with nothing to oppose its progress, it dispels the clouds as they begin to rise, and causes them to break either in the woods or upon the mountains. But whenever the storms are too violent, or the blowing of the easterly wind is interrupted by the changeable and temporary effect of the southerly and westerly ones, it then begins to rain. In the other Caribbee islands where this wind does not generally blow, the rains are so frequent and plentiful, especially in the winter season, which lasts from the middle of July to the middle of October, that, according to the most accurate observations, as much rain falls in one week as in our climates in a year. Instead of those mild refreshing showers which fall in the European climates, the rains of the Caribbee islands are torrents, the found of which might be mistaken for hail, were not that almost totally unknown under so burning a sky. These showers indeed refresh the air; but they occasion a dampness, the effects of which are not less disagreeable than fatal. The dead must be interred within a few hours after they have expired. Meat will not keep sweet above 24 hours. The fruits decay, whether they are gathered ripe or before their maturity. The bread must be made up into biscuits, to prevent its growing mouldy. Common wines turn sour, and iron turns rusty, in a day's time. The feeds can only be preserved by constant attention and care, till the proper season returns for sowing them. When the Caribbee islands were first discovered, the corn that was conveyed there for the support of the Europeans, was so soon damaged, that it became necessary to send it out in the ears. This necessary precaution so much enhanced the price of it, that few were able to purchase it. Flour was then substituted in lieu of corn; which lowered indeed the expences of transport, but had this inconvenience, that it was sooner damaged. It was imagined by a merchant, that if the flour were entirely separated from the bran, it would have the double advantage of being cheaper, and keeping longer. He caused it therefore to be sifted, and put the finest flour into strong casks, and beat it close together with iron hammers, till it became so close a body that the air could scarcely penetrate it. This method was found to answer the purpose; and if, by it, the flour cannot be preserved as long as in our dry and temperate climates, it may be kept for six months, a year, or longer, according to the degree of care taken in the preparation.

However troublesome these effects of the rain may be, it is attended with some others still more formidable; namely, frequent and dreadful earthquakes. These happening generally during the time or towards the end of the rainy season, and when the tides are highest, some ingenious naturalists have supposed that there might be a connection between them. The waters of the sky and of the sea undermine, dig up, and ravage the earth in several different ways. Among the various shocks to which the Caribbee islands are exposed from the fury of the boisterous ocean, there is one distinguished by the name of *raz de maree*, or *whirlpool*. It constantly happens, once, twice, or thrice, from July to October, and always on the western coasts, because it takes place after the time of the westerly or southerly winds, or while they blow. The waves, which at a distance seem to advance gently within 400 or 500 yards, suddenly swell against the shore, as if acted upon in an oblique

Caribbiana,
Carica.

Caricatura
||
Carinthia.

oblique direction by some superior force, and break with the greatest impetuosity. The ships which are then upon the coast, or in the roads beyond it, unable either to keep their anchors, or to put out to sea, are dashed to pieces against the land, and all on board most commonly perish. The hurricane is another terrible phenomenon in these islands, by which incredible damage is occasioned; but happily it occurs not often.

The produce of the Caribbee islands is exceedingly valuable to the Europeans, consisting of sugar, rum, molasses, indigo, &c. a particular account of which is given under the names of the respective islands as they occur in the order of the alphabet.

CARIBBIANA, or CARIBIANA, the north east coast of Terra Firma, in South America, otherwise called *New ANDALUSIA*.

CARICA, the PAPAW; a genus of the decandria order, belonging to the diccia class of plants.

Species. 1. The papaya rises with a thick, soft, herbaceous stem, to the height of 18 or 20 feet, naked till within two or three feet of the top. The leaves come out on every side, upon very long foot-stalks. Those which are situated undermost are almost horizontal, but those on the top are erect: these leaves in full grown plants are very large, and divided into many lobes deeply sinuated. The stem of the plant, and also the footstalks of the leaves, are hollow; and the whole abounds with a milky acid juice. The flowers of the male plant are produced from between the leaves, on the upper part of the plant. They have footstalks near two feet long; at the end of which the flowers stand in loose clusters, each having a separate short foot-stalk: these are of a pure white, and have an agreeable odour. The flowers of the female papaya also come out from between the leaves towards the upper part of the plant, upon very short footstalks, sitting close to the stem: they are large, and bell-shaped, composed of six petals, and are commonly yellow; when these fall away, the germen swells to a large fleshy fruit, of the size of a small melon. These fruits are of different forms: some angular, and compressed at both ends; others oval, or globular; and some pyramidal: the fruit also abounds with the same acid and milky juice as the plants.

2. The propopoa, differs from the other in having a branching stalk, the lobes of the leaves entire, the flower of a rose colour, and the fruit shaped like a pear.

Culture, &c. These plants being natives of hot countries, cannot be preserved in Britain unless constantly kept in a warm stove, which should be of a proper height to contain them. They are easily propagated by seeds, which are annually brought in plenty from the West Indies, though the seeds of the European plants ripen well. The seeds should be sown in a hot-bed early in the spring: when the plants are near two inches high, they should be removed into separate small pots, and each plunged into a hot-bed of tanners bark, carefully shading them from the sun till they have taken root; after which, they are to be treated in the same manner as other tender exotics. When they are removed into other pots, care must be taken as much as possible to preserve the ball of earth about them, because wherever their roots are laid bare they seldom survive. When they are grown to a large size, they make a noble appearance with their strong upright stems, garnished on every side near the top with large shining leaves,

spreading out near three feet all round the stem: the flowers of the male fruit coming out in clusters on every side, and the fruit of the female growing round the stalks between the leaves, are so different from any thing of European production, as well to entitle these plants to a place in the gardens of the curious. The fruit of the first species is by the inhabitants of the Caribbee islands eaten with pepper and sugar as melons, but is much inferior to a melon in its native country; but those which have ripened in Britain were delectable, the only use to which Mr Miller says he has known them put, was, when they were about half grown, to soak them in salt water to get out the acid juice, and then pickle them for onongos, to which they are a good substitute.

CARICATURA, in painting, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object.

CARICOUS, an epithet given to such tumours as resemble the figure of a fig. They are frequently found in the piles.

CARIES, the corruption or mortification of a bone. See (*the Index* subjoined to) MEDICINE.

CARIGNAN, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin. E. Long. 7. 25. N. Lat. 44. 30. It was taken in 1544, by the French; who demolished the fortifications, but spared the castle. It was also taken, and retaken, in 1691.

CARINOLA, an episcopal town of Italy, in the kingdom of Naples, and Terra di Lavoro. E. Long. 15. 5. N. Lat. 41. 15.

CARINTHIA, a duchy of Germany, in the circle of Austria, bounded by the archbishopric of Salzburg on the north, and by Carniola and the Venetian territories on the south, on the west by Tyrol, and on the east by Stiria. A part of this country was anciently called *Carnia*, and the inhabitants *Carni*; but the former afterwards obtained the name of *Carinthia*, and the latter *Carantani* or *Carinthi*. The air of this country is cold, and the soil in general mountainous and barren; but there are some fruitful dales and valleys in it, which produces wheat and other grain. The lakes, brooks, and rivers, which are very numerous, abound with fish; and the mountains yield lead and iron, and in many places are covered with woods. The river Drave, which runs across the country, is the most considerable in Carinthia. The inhabitants are partly descendants of the ancient Germans, and partly of the Slavonians or Wends. The states are constituted as in Austria, and their assemblies are held at Clagenfurt. The archbishop of Salzburg and the bishop of Bamberg have considerable territories in this country. Christianity was planted here in the 7th century. The only profession tolerated at present is the Roman catholic. The bishops are those of Gurk and Lavant, who are subject to the archbishop of Salzburg. This duchy was formerly a part of Bavaria. In the year 1282, the emperor Rodolph I. gave it to Maynard count of Tyrol, on condition, that, when his male issue failed, it should revert to the house of Austria; which happened in 1331. Carinthia has its particular governor, or *land-captain*, as he is called; and contributes annually, towards the expence of the military establishment, 637,695 florins. Only one regiment of foot is usually quartered in it.

CARIPI,

CARIPI, a kind of cavalry in the Turkish army. The caripi, to the number of about 1000, are not slaves, nor bred up in the seraglio, like the rest; but are generally Moors, or renegade Christians, who having followed adventures, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse-guards to the Grand Signior.

CARISBROOK-CASTLE, a castle situated in the middle of the Isle of Wight, where king Charles I. was imprisoned. W. Long. 1. 30. N. Lat. 50. 40.

CARISTO, an episcopal city of Greece, in the eastern part of the island of Negropont, near cape Loro. E. Long. 24. 15. N. Lat. 38. 6.

CARKE, denotes the 30th part of a SARPLAR of wool.

CARLETON (Sir Dudley), was born in Oxfordshire, 1573, and bred in Christ-church college. He went as secretary to Sir Ralph Winwood into the Low Countries, when king James resigned the cautionary towns to the States; and was afterwards employed for 20 years as ambassador to Venice, Savoy, and the United Provinces. King Charles created him viscount Dorchester, and appointed him one of his principal secretaries of state; in which office he died in 1631. He was esteemed a good statesman, though an honest man; and published several political works.

CARLINA, the **CARLINE THISTLE**; a genus of the polygamia aequalis order, belonging to the syngenesia class of plants. There are seven species, only one of which is a native of Britain, viz. the vulgaris. The others are natives of the south of France or Italy; and are very easily propagated in this country by seeds, which must be sown on a bed of fresh undunged earth, where they are to remain, as they do not bear transplanting. When the plants appear above ground, they should be carefully weeded, and afterwards thinned, leaving them about ten inches or a foot asunder. The second year most of them will flower: but, unless the season proves dry, they rarely produce good seeds in this country, and some of the plants decay soon after they have flowered, so that it is pretty difficult to maintain them here. The roots are used in medicine, and for that purpose are imported from those countries where the plants grow naturally. As we receive them they are about an inch thick, externally of a rusty brown colour, corroded as it were on the surface, and perforated with numerous small holes, appearing on the surface as if worm-eaten. They have a strong smell, and a subacrid, bitterish, weakly aromatic taste. They are looked upon to be warm alexipharmics and diaphoretics. Frederic Hoffman the Elder, relates that he has observed a decoction of them in broth to occasion vomiting. They have been for some time greatly esteemed among foreign physicians; but never were much in use in this country. The present practice has entirely rejected them, nor are they often to be met with in the shops.

CARLINE, or *Caroline*, a silver coin current in the Neapolitan dominions, and worth about 4d. of our money.

CARLINGFORD, a port-town of Ireland, seated on Carlingford bay, in the county of Louth, and province of Leinster, 22 miles north of Drogheda. W. Long. 6. 24. N. Lat. 24. 5.

CARLISLE, the capital city of the county of Cumberland, seated on the south of the river Eden, and be-

tween the Petterel on the east, and the Caude on the west. It is surrounded by a strong stone wall, and has a pretty large castle in the western part of it, as also a citadel in the eastern part, built by Henry VIII. It flourished in the time of the Romans, as appears from the antiquities that are to be met with here, and the Roman coins that have been dug up. At the departure of the Romans this city was ruined by the Scots and Picts; and was not rebuilt till the year 680, by Egfrid, who encompassed it with a wall, and repaired the church. In the 8th and 9th centuries, the whole country was again ruined, and the city laid desolate by the incursions of the Norwegians and Danes. In this condition it remained till the time of William Rufus; who repaired the walls and the castle, and caused the houses to be rebuilt. It was fortified by Henry I. as a barrier against Scotland; he also placed a garrison in it, and made it an episcopal see. It was twice taken by the Scots, and afterwards burnt accidentally in the reign of Richard II. The cathedral, the suburbs, and 1500 houses, were destroyed at that time. It is at present in a good condition; and has three gates, the English on the south, the Scotch on the north, and the Irish on the west. It has two parishes, and as many churches, St Cuthbert and St Mary's, the last of which is the cathedral, and is separated from the town by a wall of its own. The eastern part, which is the newest, is a curious piece of workmanship. The choir with the aisles is 71 feet broad; and has a stately east window 48 feet high and 30 broad, adorned with curious pillars. The roof is elegantly vaulted with wood; and is embellished with the arms of England and France quartered; as also with Piercy's, Lucy's, Warren's, Mowbray's, and many others. In the choir are the monuments of three bishops who are buried there. The west end was in part demolished in 1641, in the time of the civil wars. The Picts wall, which was built across the country from Newcastle, terminates near this place. Carlisle was taken by the rebels, Nov. 15, 1745; and was retaken by the duke of Cumberland, on the 10th of December following. It is governed by a mayor, twelve aldermen, two bailiffs, &c. and has a considerable market on Saturdays. The manufactures of Carlisle are chiefly of printed linens, for which near 3000*l.* per annum is paid in duties. It is also noted for a great manufacture of whips, in which a great number of children are employed.—Salmons appear in the Eden in numbers, so early as the months of December and January; and the London and even Newcastle markets are supplied with early fish from this river: but it is remarkable, that they do not visit the Elk in any quantity till April; notwithstanding the mouths of the two rivers are at a small distance from each other.

CARLOCK, in commerce, a sort of isinglass, made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but it is also used by the dyers. The best carlock comes from Altarcan, where a great quantity of sturgeon is caught.

CARLOSTAD, or **CARLSTAD**, a town of Sweden in Wermeland, seated on the lake Warmer, in E. Long. 14. 4. N. Lat. 59. 16.

CARLOSTAD, or *Carlstadt*, a town of Hungary, capital of Croatia, and the usual residence of the governors of the province. It is seated on the river Rulph, in E. Long. 16. 5. N. Lat. 45. 34.

Carlowitz
||
Carmelites.

CARLOWITZ, a small town of Hungary, in Sclavonia, remarkable for a peace concluded here between the Turks and Christians in 1669. It is seated on the west side of the Danube, in E. Long. 19. 5. N. Lat. 45. 25.

CARLSTADT, a town of Germany, in the circle of Franconia, and bishopric of Wurtzburg, seated on the river Maine, in E. Long. 9. 51. N. Lat. 50. 0.

CARMAGNIOLA, a fortified town of Italy, in Piedmont, with a good castle. It was taken by the French in 1691, and retaken by prince Eugene the same year. It is seated in a country abounding in corn, flax, and silk, near the river Po, in E. Long. 7. 32. N. Lat. 44. 43.

CARMEL, a high mountain of Palestine, standing on the skirts of the sea, and forming the most remarkable head-land on all that coast. It extends eastward from the sea as far as the plain of Jezreel, and from the city of that name quite to Cæsarea on the south. It seems to have had the name of *Carmel* from its great fertility; this word, according to the Hebrew import, signifying the *vine of God*, and is used in scripture to denote any fruitful spot, or any place planted with fruit-trees. This mountain, we are assured, was very fertile. Mr Sandys acquaints us, that, when well cultivated, it abounds with olives, vines, and variety of fruits and herbs both medicinal and aromatic. Others, however, represent it as rather dry and barren; which perhaps may have happened from the neglect of agriculture so common in all parts of the Turkish empire, especially where they are exposed to the incursions of the Arabs. Carmel is the name of the mountain, and of a city built on it; as well as of a heathen deity worshipped in it, but without either temple or statue: tho' anciently there must have been a temple, as we are told that this mountain was a favourite retreat of Pythagoras, who spent a good deal of time in the temple, without any person with him. But what hath rendered mount Carmel most celebrated and revered both by Jews and Christians, is its having been the residence of the prophet Elijah, who is supposed to have lived there in a cave, (which is there shown), before he was taken up into heaven.

CARMELITES, an order of religious, making one of the four tribes of mendicants or begging friars; and taking its name from mount Carmel, formerly inhabited by Elias, Elisha, and the children of the prophets; from whom this order pretends to descend in an uninterrupted succession. The manner in which they make out their antiquity has something in it too ridiculous to be rehearsed. Some among them pretend they are descendants of Jesus Christ; others go further, and make Pythagoras a Carmelite, and the ancient druids regular branches of their order. Phocas, a Greek monk, speaks the most reasonably. He says, that in his time, 1185, Elias's cave was still extant on the mountain; near which were the remains of a building which intimated that there had been anciently a monastery: that, some years before, an old monk, a priest of Calabria, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers.--In 1209, Albert, patriarch of Jerusalem, gave the solitaries a rigid rule, which Papebroch has since printed. In 1217, or, according to others, 1226, pope Honorius III. approved and conformed it. This rule con-

tained 16 articles; one of which confined them to their cells, and enjoined them to continue day and night in prayer; another prohibited the brethren having any property; another enjoined fasting from the feast of the holy cross till Easter, except on Sundays; abstinence at all times from flesh was enjoined by another article; one obliged them to manual labour; another imposed a strict silence on them from vespers till the tierce the next day.

The peace concluded by the emperor Frederic II. with the Saracens, in the year 1229, so disadvantageous to Christendom, and so beneficial to the infidels, occasioned the Carmelites to quit the Holy Land, under Alan the fifth general of the order. He first sent some of the religious to Cyprus, who landed there in the year 1238, and founded a monastery in the forest of Fortania. Some Sicilians, at the same time, leaving mount Carmel, returned to their own country, where they founded a monastery in the suburbs of Messina. Some English departed out of Syria, in the year 1240, to found others in England. Others of Provence, in the year 1244, founded a monastery in the desert of Aigualates, a league from Marceilles: and thus, the number of their monasteries increasing, they held their European general chapter in the year 1245, at their monastery of Aylesford in England.—This order is so much increased, that it has, at present, 38 provinces; besides the congregation of Mantua, in which are 54 monasteries, under a vicar-general; and the congregations of Barefooted Carmelites in Italy and Spain, which have their peculiar generals.

After the establishment of the Carmelites in Europe, their rule was in some respects altered; the first time, by pope Innocent IV. who added to the first article a precept of chastity, and relaxed the 11th which enjoins abstinence at all times from flesh, permitting them, when they travelled, to eat boiled flesh: this pope likewise gave them leave to eat in a common refectory, and to keep asses or mules for their use. Their rule was again mitigated by the popes Eugenius IV. and Pius II. Hence the order is divided into two branches, viz. the *Carmelites of the ancient observance*, called the *moderate or mitigated*; and those of the *strict observance*, who are the *barefooted Carmelites*; a reform set on foot in 1540, by S. Theresa, a nun of the convent of Avila, in Castile: these last are divided into two congregations, that of Spain, and that of Italy.

The habit of the Carmelites was at first white, and the cloak laced at the bottom with several lists. But pope Honorius IV. commanded them to change it for that of the Minims. Their capsculary is a small woollen habit of a brown colour, thrown over their shoulders. They wear no linen shirts; but instead of them lincsey-woolsey, which they change twice a-week in the summer, and once a-week in the winter.

If a monk of this order lies with a woman, he is prohibited saying mass for three or four years, is declared infamous, and obliged to discipline himself publicly once a-week. If he is again guilty of the same fault, his penance is doubled; and if a third time, he is expelled the order.

CARMEN, an ancient term among the Latins, used in a general sense to signify a verse; but more particularly to signify a spell, charm, form of expiation or exorcism, couched in a few words placed in a mystic or-

Carmelites,
Carmen.

Carmentalia der, on which its efficacy depended. Pezron derives the word *carmen* from the Celtic *carm*, the shout of joy, or the verses which the ancient bards sung to encourage the soldiers before the combat.—*Carmen* was anciently a denomination given also to precepts, laws, prayers, imprecations, and all solemn formula couched in a few words placed in a certain order, though written in prose. In which sense it was that the elder Cato wrote a *Carmen de moribus*, which was not in verse but in prose.

CARMENTALIA, a feast among the ancient Romans, celebrated annually upon the 11th of January, in honour of Carmenta, or Carmentis, a prophetess of Arcadia, mother of Evander, with whom she came into Italy 60 years before the Trojan war. The solemnity was also repeated on the 15th of January, which is marked in the old calendar by *Carmentalia relata*. This feast was established on occasion of a great fecundity among the Roman dames, after a general reconciliation with their husbands, with whom they had been at variance, in regard of the use of coaches being prohibited them by an edict of the senate. This feast was celebrated by the women: he who offered the sacrifices was called *sacerdos carmentalis*.

CARMINATIVES, medicines used in colics, or other flatulent disorders, to dispel the wind.

The word comes from the Latin *carninare*, to card or tease wool, and figuratively to attenuate and discuss wind or vapours, and promote their discharge by perspiration. Tho' Dr Quincey makes it more mysterious: He says it comes from the word *carmen*, taking it in the sense of an invocation or charm; and makes it to have been a general name for all medicines which operated like charms, *i. e.* in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately cease upon dispersion; the term *carmine* became in a peculiar sense applied to medicines which gave relief in windy cases, as if they cured by enchantment: but this interpretation seems a little too far strained.

The action of carminatives may be somewhat understood by considering that all the parts of the body are perspirable. Sanctorius determines all that we call wind to be such perspirable matter as makes its escape through the coats of the stomach and intestines; between the several parts of the muscles also may be such perspirable matter: 'now whatever rarefies, and renders collections of these vapours thinner, conduces to their discharge; and as all those things of this denomination in medicine are warm, attenuant, and consist of light subtle parts, it is easy to understand how a mixture of them with the flatus may agitate and rarefy it, especially as they also create such agreeable sensations on the fibres, which help, by invigorating their tone, also to expel it.

CARMINE, a powder of a very beautiful red colour, bordering upon purple; and used by painters in miniature, though rarely on account of its great price. The manner of preparing it is kept a secret by the colour-makers; neither do any of those receipts which have for a long time been published concerning the preparation of this and other colours at all answer the purpose. See *COLOUR-Making*.

CARMONA, a town of Italy in Frioli; and in the county of Goritz, seated on a mountain near the river

Indri. It belongs to the house of Austria. E. Long. 5. 37. N. Lat. 46. 15.

CARMONA, an ancient town of Spain in Andalusia. The gate towards Seville is one of the most extraordinary pieces of antiquity in all Spain. It is seated in a fertile country, 15 miles east of Seville. W. Long. 5. 37. N. Lat. 37. 24.

CARNATION, in botany. See *DIANTHUS*.

CARNATION-Colour, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Corregio in Italy, and Rubens and Vanduyke in Flanders, excelled in carnations.—In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instruction therein; neither are there any regarded by those who have acquired a skill this way: the various colouring for carnations may be easily produced, by taking more or less red, blue, yellow, or bistre, whether for the first colouring, or for the finishing: the colour for women should be bluish, for children a little red, both fresh and gay; and for the men it should incline to yellow, especially if they are old.

CARNEADES, a celebrated Greek philosopher, was a native of Cyrene in Africa, and founder of the third academy. He was so fond of study, that he not only avoided all entertainments, but forgot even to eat at his own table; his maid-servant Melissa was obliged to put the victuals into his hand. He was an antagonist of the Stoics; and applied himself with great eagerness to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by a Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent ambassadors to Rome, who got the fine mitigated to 100 talents. Carneades the academic, Diogenes the Stoic, and Critolaus the Peripatetic, were charged with this embassy. Before they had an audience of the senate, they harangued to great multitudes in different parts of the city. Carneades's eloquence was distinguished from that of the others by its strength and rapidity. Cato the elder made a motion in the senate, that these ambassadors should be immediately sent back, because it was very difficult to discern the truth 'trot the arguments of Carneades. The Athenian ambassadors (said many of the senators) were sent rather to force us to comply with their demands, than to solicit them by persuasion; meaning, that it was impossible to resist the power of that eloquence with which Carneades addressed himself to them. According to Plutarch, the youth at Rome were so charmed by the fine orations of this philosopher, that they forsook their exercises and other diversions, and were carried with a kind of madness to philosophy; the humour of philosophising spreading like enthusiasm. This grieved Cato, who was particularly afraid of the subtilty of wit and strength of argument with which Carneades maintained either side of a question. Carneades harangued in favour of justice one day, and the next day against it, to the admiration of all who heard him, among whom were Galba and Cato, the greatest orators of Rome. This was his element; he delighted in demolishing his own work; because he served in the end to confirm his grand principle, that there are only probabilities or resemblances

Carneades.

Carnelian
||
Carniola.

of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carneades argued in favour of injustice, yet he himself acted according to the strict rules of justice. The following was a maxim of Carneades: "If a man privately knew that his enemy, or any other person whose death might be of advantage to him, would come to sit down on grass in which there lurked an asp, he ought to give him notice of it, though it were in the power of no person whatever to blame him for being silent." Carneades, according to some, lived to be 85 years old; others make him to be 90: his death is placed in the 4th year of the 162^d Olympiad.

CARNELIAN, in natural history, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter: it is of a fine, compact, and close texture; of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations: but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: it is not at all affected by acid menstrua: the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long continued heat will reduce it to a pale dirty gray.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some not despicable ones in England.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know of no other use of the stone than the cutting seals on it; to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax.

CARNERO, in geography, a name given to that part of the gulph of Venice, which extends from the western coast of Istria to the island of Grossa and the coast of Morlachia.

CARNERO is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

CARNIOLA, a duchy of Germany bounded on the south by the Adriatic sea, and that part of Istria possessed by the republic of Venice; on the north, by Carinthia and Stiria; on the east, by Slavonia and Croatia; on the west, by Friuli, the county of Gorz or Goritz, and a part of the gulph of Venice; extending in length about 10 miles, and in breadth about 50. It had its ancient name *Carnia*, as well as the modern one *Carniola*, from its ancient inhabitants the *Carni*, a tribe of Scythians, otherwise called *Japides*, whence

this and the adjacent countries were also called *Japidia*.

Carniola is full of mountains, some of which are cultivated and inhabited, some covered with wood, others naked and barren, and others continually buried in snow. The valleys are very fruitful. Here are likewise mines of iron, lead, and copper; but salt mull be had from the sovereign's magazines. There are several rivers, besides many medicinal springs and inland lakes. The common people are very hardy, going barefooted in winter through the snow, with open breasts, and sleeping on a hard bench without bed or bolster. Their food is also very coarse and mean. In winter, when the snow lies deep on the ground, the mountaineers bind either small baskets, or long thin narrow boards, like the Laplanders, to their feet, on which, with the help of a stout staff or pole, they descend with great velocity from the mountains. When the snow is frozen, they make use of a sort of irons or skais. In different parts of the country, the inhabitants, especially the common sort, differ greatly in their dress, language, and manner of living. In Upper and Lower Carniola they wear long beards. The languages chiefly in use are the Slavonian or Wendish, and German; the first by the commonalty, and the latter by people of fashion. The duchy is divided into the Upper, Lower, Middle, and Inner, Carniola. The principal commodities exported hence are iron, steel, lead, quicksilver, white and red wine, oil of olives, cattle, sheep, cheese, linen, and a kind of woollen stuff called *mahalan*, Spanish leather, honey, walnuts, and timber; together with all manner of wood-work, as boxes, dishes, &c.—Christianity was first planted here in the eighth century.—Lutheranism made a considerable progress in it; but, excepting the Walachians or Uskokes, who are of the Greek church, and style themselves *Staraverzi*, i. e. old believers, all the inhabitants at present are Roman Catholics. Carniola was long a marquise or margravate; but in the year 1231 was erected into a duchy. As its proportion towards the maintenance of the army, it pays annually 363,171 florins; but only two regiments of foot are quartered in it.

CARNIVAL, or CARNAVAL, a time of rejoicing, a season of mirth, observed with great solemnity by the Italians, particularly at Venice, holding from the twelfth-day till Lent.

The word is formed from the Italian *Carnavalle*; which Mr Du Cange derives from *Carn-a-val*, by reason the flesh then goes to pot, to make amends for the season of abstinence then ensuing. Accordingly, in the corrupt Latin, he observes, it was called *Carnelovenum*, and *Carnisprivium*; as the Spaniards still denominate it *carnes tollendas*.

Fests, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in carnival-time. The carnival begins at Venice the second holiday in Christmasts: Then it is they begin to wear masks, and open their play-houses and gaming-houses; the place of St Mark is filled with mountebanks, jack-puddings, pedlars, whores, and such like mob, who flock thither from all parts. There have been no less than seven sovereign princes and 30,000 foreigners here to partake of these diversions.

CARNIVOROUS, an epithet applied to those animals which naturally seek and feed on flesh.

Carniola
||
Carnivoro.

It has been a dispute among naturalists, whether man is naturally carnivorous. Those who take the negative side of the question, insist chiefly on the structure of our teeth, which are mostly incisores or molares; not such as *carnivorous* animals are furnished with, and which are proper to tear flesh in pieces: to which it may be added, that, even when we do feed on flesh, it is not without a preparatory alteration by boiling, roasting, &c. and even then, that it is the hardest of digestion of all foods. To these arguments Dr Wallis subjoins another; which is, that all quadrupeds which feed on herbs or plants, have a long colon, with a cæcum at the upper end of it, or somewhat equivalent, which conveys the food by a long and large progress, from the stomach downwards, in order to its slower passage and longer stay in the intestines; but that, in *carnivorous* animals, such cæcum is wanting, and instead thereof there is a more short and slender gut, and a quicker passage through the intestines. Now, in man, the cæcum is very visible: a strong presumption that nature, who is still consistent with herself, did not intend him for a *carnivorous* animal.—It is true, the cæcum is but small in adults, and seems of little or no use; but in a fetus it is much larger in proportion: And it is probable, our customary change of diet, as we grow up, may occasion this shrinking. But to these arguments, Dr Tyson replies, that if man had been by nature designed not to be *carnivorous*, there would doubtless have been found, somewhere on the globe, people who do not feed on flesh; which is not the case. Neither are carnivorous animals always without a colon and cæcum; nor are all animals carnivorous which have those parts: the opossum, for instance, hath both a colon and cæcum, and yet feeds on poultry and other flesh; whereas the hedge-hog, which has neither colon nor cæcum, and so ought to be carnivorous, feeds only on vegetables. Add to this, that hogs, which have both, will feed upon flesh when they can get it; and rats and mice, which have large cæcums, will feed on bacon as well as bread and cheese. Lastly, the human race are furnished with teeth necessary for the preparation of all kinds of foods; from whence it would seem, that nature intended we should live on all. And as the alimentary duct in the human body is fitted for digesting all kinds of food, ought we not rather to conclude, that nature did not intend to deny us any?

It is no less disputed, whether mankind were *carnivorous* before the flood. St Jerom, Chrysostom, Theodoret, and other ancients, maintain, that all animal food was then forbidden; which opinion is also strenuously supported among the moderns by Curcellæus, and refuted by Heidegger, Danzius, Bockhart, &c.

CARO (Annibal), a celebrated Italian poet, was born at Civita Nuovo in 1507. He became secretary to the duke of Parma, and afterwards to Cardinal Farnese. He was also made a knight of Malta. He translated Virgil's *Æneid* into his own language with such propriety and elegance of expression, that he was allowed by the best judges, to have equalled the original. He also translated Aristotle's rhetoric; two oratorios of Gregory Nazianzen, with a discourse of Cyprian. He wrote a comedy; and a miscellany

VOL. III.

of his poems was printed at Venice in 1584. He died at Rome in 1566.

Carolina.

CAROLINA, a province of North America, comprehending the most westerly part of Florida, and lying between 29 and 36-degrees of N. Lat. It is bounded on the east by the Atlantic, and on the west by the Pacific ocean, on the north by Virginia, and on the south by the remaining part of Florida.

This country is seated between the extremities of heat and cold, though the heat is more troublesome in summer than the cold in winter; their winters being very short, and the frosty mornings frequently succeeded by warm days. The air is generally serene and clear the greatest part of the year; but in February and March, the inhabitants have a custom of burning the woods, which causes such a smoke as to strangers would seem to proceed from a fog or thick-ness in the air. The smoke of the tar-kilns likewise deceives strangers, and gives them an ill opinion of the air of Carolina; to which also conduces a custom of the Indians of setting fire to the woods in their huntings, for many miles round. The great rains are in winter, though they are not without heavy showers at midsummer; add to these the constant dews that fall in the night, which refresh the ground and supply the plants with moisture. In North Carolina, the north-west winds in the winter occasion very pinching weather; but they are not of long continuance. Westerly winds bring very pleasant weather; but the southerly are hot and unwholesome, occasioning fevers and other disorders. But this must be understood of summer, for in winter they are very comfortable. The depth of winter is towards the latter end of February, and then the ice is not strong enough to bear a man's weight. In August and September, there are sometimes great storms and squalls of wind, which are so violent as to make lanes of 100 feet wide, more or less, through the woods, tearing up the trees by the roots. These storms generally happen once in about seven years; and are attended with dreadful thunder, lightning, and heavy rains. They commonly happen about the time of the hurricanes which rage so fatally among the islands between the tropics; and seem to be occasioned by them, or to proceed from the same cause: but by the time they reach Carolina, their force is much abated; and the farther north they proceed, so much the more do they decrease in fury. The soil on the coast is sandy; but farther up, the country is so fruitful, that they have not yet been at the trouble to manure their land. The grains most cultivated are Indian corn and rice, though any sort will thrive well enough; they have also pulse of several sorts, little known in England. All kinds of garden stuff usual in England are cultivated here, and may be had in great plenty. They export large quantities yearly of rice, pitch, tar, turpentine, deer-skins, and timber for building; cyprès, cedar, sassafras, oak, walnut, and pine. Besides these they also send out beef, pork, tallow, hides, furs, wheat, peas, potatoes, honey, bees-wax, myrtle-wax, tobacco, snake-root, cotton, several sorts of gums and medicinal drugs. Indigo is also cultivated in this province, but of an inferior quality to that which comes from the Caribbee islands. It hath been attempted

Carolina. in vain to cultivate vines, and produce silk, in this country; for though the frosts here do not continue long without intervals of warmer weather, they are sufficient to check the growth of the vine, as well as olives, dates, oranges, &c. The furs are bought of the Indians with vermilion, lead, gunpowder, coarse cloth, iron, and spirituous liquors. As yet they have not a sufficient number of handicraftsmen; which renders labour very dear, and a supply of cloaths from Europe necessary. The aspect of the country is very fine, being adorned with beautiful rivers and creeks, and the woods with lofty timber, which afford delightful and pleasant seats for the planters, and render the fencing their lands very easy. And as they have plenty of fish, wild-fowl, and venison, besides other necessaries which this country produces naturally, they live easy and luxuriously. The planters and their families that are born here, are troubled with few distempers; and are generally tall, well-made, and active. The women who are not exposed to the weather are remarkably fair and handsome, with fine eyes. They marry at thirteen or fourteen; and where there is no clergyman, the ceremony is performed by a justice of the peace. They are very fruitful, have easy labours, and the children at nine months old are able to run about the house. Both sexes, as well young as old, are very dextrous in paddling and managing the canoes, being bred to it from their infancy. The religion of the planters is that of the church of England; but, as there is liberty of conscience, here are dissenters of all sorts.—The most substantial people build their houses with brick and lime made with oyster-shells; for there is no stone except near the mountains. The meaner sort make theirs with rough boards, and cover them with shingles. Their diet, except Indian corn, differs little from ours; and they import several sorts of strong liquors. Besides which they have cyder, perfimon, and cedar-beer, of their own. They have likewise a beer made with molasses, wheat-bran and hops, which is very good. There are mines of pit-coal in this country; but they have such plenty of wood for firing, that there is no occasion to work them.

Their rivers are large, and navigable a great many miles up the country. They rise near the mountains, and abound with delicate fish, besides water-fowl of different kinds. In some there are islands which yield good pasture, without the annoyance of wild beasts. The chief mountains are the Cherokee or Allegany mountains, which are situated north and north-west, five or six hundred miles distant from the sea. They are very high; and abound with trees, plants, stones, and minerals, of different kinds. The inhabitants chiefly make use of paper-money among themselves.

The most common diseases are agues, cachexies, fluxes, the yaws, colicks, convulsions, the hooping-cough, tetters, the prickly heat, and the itch.

The Indians, like those in other parts, are well made, of a red copper colour, with black hair, and the whites of their eyes streaked with red. They have no beard nor hair on any part of the body but the head*. Those that are clothed and brought up among the planters, have their skins of a bright reddish colour; but those that go naked are more dusky,

from a custom of daubing themselves with bear's grease. However, by painting themselves with roucou, they appear more red than they naturally would be. They use other colours on different occasions. They generally go stark naked, except a few who have been taught to be a little more modest. They are great smokers, and good marksmen; and will walk on the ridge of a house without fear or danger of falling.

This country is divided into North and South Carolina, and Georgia; each of which is under a particular governor. The North is subdivided into four counties, Granville, Colleton, Berkley, and Craven; and South Carolina into two, Clarendon and Albemarle. This last is also divided into fourteen parishes or townships, each of which has a brick or timber church. The former likewise has the same number of parishes. Charlestown is the capital of the whole country.

Carolina was discovered by Sebastian Cabot, about the year 1500, in the reign of Henry VII. but the settling of it being neglected by the English, a colony of French Protestants, by the encouragement of Admiral Coligni, were transported thither; and named the place of their first settlement *Aux Carolina*, in honour of their prince, Charles IX. of France: but in a short time that colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till the year 1664, when 800 English landed at Cape-Fear in North Carolina, and took possession of the country. In 1670 Charles II. of Britain granted Carolina to the Lords Berkley, Clarendon, Albemarle, Craven and Ashley, Sir George Carteret, Sir William Berkley, and Sir John Colleton. The plan of government for this new colony was drawn up by the famous Mr Locke, who very wisely proposed an universal toleration in religious matters. The only restriction in this respect was, that every person claiming the protection of that settlement, should, at the age of 17, register himself in some particular communion. To civil liberty, however, our philosopher was not so favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of a legislation. The court, which was composed of this sovereign body, and called the *Palatine Court*, was invested with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and unprecedented titles. They were, for instance, to create in each county two *caciques*, each of whom was to be possessed of 24,000 acres of land; and a *landgrave*, who was to have 80,000. The persons on whom these honours should be bestowed were to compose the upper house, and their possessions were made unalienable. They had only the right of farming or letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about a shilling *per acre*, and even this rent was redeemable. All the inhabitants, however, both slaves and

* See *American*, n° 29.

Carolina
↓
Carp.

and freemen, were under an obligation to take up arms upon the first order from the Palatine court.

It was not long before the defects of this constitution became apparent. The proprietary lords used every endeavour to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. Tho' a toleration in religious matters was a part of the original constitution, dissensions arose likewise on that account. In 1705, Carteret, now Lord Granville, who, as the oldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the Church of England; and this act of violence, though disavowed and rejected by the mother-country, inflamed the minds of the people. In 1720, while this animosity was still subsisting, the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword; but, in 1728, the lords proprietors having refused to contribute towards the expences of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The rest received a recompence of about 24,000 l. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place, and the settlement of Georgia commenced in 1732. See GEORGIA.

CAROLINE-books, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing 120 heads of accusation against the council of Nice, and condemning the worship of images.

CAROLUS, an ancient English broad piece of gold, struck under Charles I. Its value has of late been at 23 shillings Sterling, though at the time it was coined it is said to have been rated at 20 Shillings.

CAROLUS, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. The carolus was worth 12 deniers, when it ceased to be current. Those which are still current in trade in Lorrain, or in some neighbouring provinces, go under the name of French sols.

CAROTIDS, in anatomy, two arteries of the neck, which convey the blood from the aorta to the brain; one called the *right*, and the other the *left*, Carotid.

CARP, in ichthyology, the English name of a species of cyprinus. See CYPRINUS; also *Carp-Fishing*.

The carp is the most valuable of all kinds of fish for stocking of ponds. It is very quick in its growth, and brings forth the spawn three times a-year, so that the increase is very great. The female does not begin to breed till eight or nine years old; so that in breeding-ponds a supply must be kept of carp of that age. The best judges allow, that, in stocking a breeding-pond, four males should be allowed to twelve

females. The usual growth of a carp is two or three inches in length in a year; but, in ponds which receive the fattening of common sewers, they have been known to grow from five inches to 18 in one year. A feeding-pond of one acre extent will very well feed 300 carp of three years old, 200 of two years, and 400 of one year old. Carp delight greatly in ponds that have marley sides; they love also clay-ponds well sheltered from the winds, and grown with weeds and long grafs at the edges, which they feed on in the hot months. Carp and tench thrive very fast in ponds and rivers near the sea, where the water is a little brackish; but they are not so well tasted as those which live in fresh water. Grains, blood, chickens-guts, and the like, may at times be thrown into carp-ponds, to help to fatten the fish. To make them grow large and fat, the growth of grafs under the water should by all means possible be encouraged. For this purpose, as the water decreases in the summer, the sides of the pond left naked and dry should be well raked with an iron rake, to destroy all the weeds, and cut up the surface of the earth: hay-seed should then be sown plentifully in these places; and more ground prepared in the same manner, as the water falls more and more away. By this means there will be a fine and plentiful growth of young grafs along the sides of the pond to the water's edge; and when the rains fill up the pond again, this will be all buried under the water, and will make a feeding-place for the fish, where they will come early in the morning, and will fatten greatly upon what they find there.

CARPEA, a kind of dance anciently in use among the Athenians and Magnesians, performed by two persons, the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to ploughing and sowing, still looking warily about him as if afraid of being surpris'd: the robber at length appears, and the labourer, quitting his plough, betakes himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes, and in cadence. Sometimes the robber was overcome, and sometimes the labourer; the victor's reward being the oxen and plough. The design of the exercise was to teach and accustom the peasants to defend themselves against the attacks of ruffians.

CARPENTER, a person who practises CARPENTRY.

CARPENTER of a Ship, an officer appointed to examine and keep in order the frame of a ship, together with her masts, yards, boats, and all other wooden machinery. It is his duty in particular to keep the ship *tight*; for which purpose he ought frequently to review the decks and sides, and to caulk them when it is necessary. In the time of battle, he is to examine up and down, with all possible attention, in the lower apartments of the ship, to stop any holes that may have been made by shot, with wooden plugs provided of several sizes.

CARPENTRAS, an episcopal town of Provence in France, and capital of Venaissin. It is subject to the Pope; and is seated on the river Anson, at the foot of a mountain. E. Long. 5. 6. N. Lat. 44. 4.

CARPENTRY, the art of cutting, framing, and
10 B 2 joining

Carp
↓
Carpentry.

Carpentum joining large pieces of wood, for the uses of building. It is one of the arts subservient to architecture, and is divided into house-carpentry and ship-carpentry: the first is employed in raising roofing, flooring of houses, &c. and the second in the building of ships*, barges, &c. The rules in carpentry are much the same with those of JOINERY; the only difference is, that carpentry is used in the larger and coarser-work, and joinery in the smaller and curious.

* See Ship-building.

CARPENTUM, in antiquity, a name common to divers sorts of vehicles, answering to coaches as well as waggons, or even carts, among us. The Carpentum was originally a kind of car or vehicle in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from *carro*; others from *Carmenta* the mother of Evander, by a conversion of the *m* into *p*.

CARPET, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid upon the floor.

Persian and Turkey carpets are those most esteemed; though at Paris there is a manufactory after the manner of Persia, where they make them little inferior, not to say finer than the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant.—There are also carpets of Germany, some of which are made of woolen stuffs, as felices, &c. and called square carpets: others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and, lastly, there are some made of dogs hair. We have likewise carpets made in Britain, which are used either as floor-carpets, or to cover chairs, &c. It is true, we are not arrived at the like perfection in this manufacture with our neighbours the French; but may not this be owing to the want of a like public encouragement?

CARPI, a principality of Modena in Italy, lying about four leagues from that city. It formerly belonged to the house of Pio; the elder sons of which bore the title of *Princes of St Gregory*. In the beginning of the 14th century *Manfred* was the first prince of Carpi; but in the 16th, the Emperor Charles V. gave the principality to Alfonso Duke of Ferrara. This nobleman, in recompence, gave to Albert Pio, to whom the principality of Carpi belonged of right, the town of Sassuolo and some other lands. Albert was, however, at last obliged to retire to Paris; where, being tripped of all his estates, he died in 1538, with the reputation of being one of the best and bravest men of his age. The family of Pio is yet in being, and continues attached to the French Court. Some of them have even been raised to the purple, and still make a figure in Europe.

CARPI, a town of Italy in the duchy of Modena, and capital of the last mentioned principality. It has a strong castle, and is situated in E. Long. 11. 12. N. Lat. 44. 45.

CARPI, a town of the Veronese in Italy, memorable for a victory gained by the Imperialists over the French in 1701. It is subject to the Venetians; and is situated on the river Adige, in E. Long. 11. 39. N. Lat. 45. 10.

CARPINUS, the HORN-BEAM; a genus of the Polyandra order, belonging to the Monœcia class of plants. There are four species, of which only one is a native of Britain, and this is the only one that merits notice. It loves a poor stiff soil on the sides of hills, is easily transplanted, and bears lopping. Cattle eat the leaves, but pasturage will not flourish under its shade. The wood burns like a candle, is very white, tough, harder than hawthorn, and capable of supporting a great weight. It is useful in turning, and for making many implements in husbandry. It makes cogs for mill-wheels, even superior to yew. The inner bark is much used in Scandinavia to dye yellow. In Britain, the trees will grow to a large size, but are rarely suffered to do so; and of late years this tree has been considered only as a shrub, and never cultivated but for underwood in the country, and in the nurseries to form hedges after the French manner.

CARPOBALSAM, in the *Materia Medica*, the fruit of the tree which yields the true oriental balsam. The Carpopallum is used in Egypt, according to Prosper Alpinus, in all the intentions in which the balsam itself is applied: but the only use the Europeans make of it, is in Venice-treacle and Mithridate; and in these not a great deal, for cubebs and juniper-berries are generally substituted in its place.

CARPOCRATIANS, a branch of the ancient Gnostics, so called from *Carpocrates*, who in the second century revived and improved upon the errors of Simon Magus, Menander, Saturninus, and other Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature was unknown. The world, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that a necessary condition of perfection.

CARPUS, the wrist. See ANATOMY, n° 53.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See CHARIOT. The word is from the ancient Gaulish, or Celtic, *Carr*; mentioned by Cæsar, in his commentaries, under the name *Carrus*. Plutarch relates, that Camillus having entered Rome in triumph, mounted on a *carr* drawn by four white horses, it was looked on as too haughty an innovation.

CARR, is also used for a kind of light open chariot. The *carr*, on medals, drawn either by horses, lions or elephants, usually signifies either a triumph or an apotheosis; sometimes a procession of the images of the gods at a solemn supplication, and sometimes of those of some illustrious family at a funeral.—The *carr* covered, and drawn by mules, only signifies a *consecration*, and the honour done any one of having his image carried at the games of the Circus. See CONSECRATION, &c.

CARRIAGE, a vehicle serving to convey persons, goods, merchandizes, and other things, from one place to another.

Carpinus
1 Carriage.

Carriage
|
Carrier.

For the construction and mechanical principles of wheel-carriages. See *MECHANICS*, n° 59.

CARRIAGE of a Cannon, the frame or timber-work on which it is mounted, serving to point it for shooting, or to carry it from one place to another. It is made of two planks of wood, commonly of one-half the length of the gun, called the cheeks, and joined by three wooden transoms, strengthened with three bolts of iron. It is mounted on two wheels, but on a march has two fore-wheels with limbers added. The principal parts of a carriage are the cheeks, transoms, bolts, plates, train, bands, bridge, bed, hooks, trunnion-holes and capsquare.

Block-CARRIAGE, a cart made on purpose for carrying mortars and their beds from place to place.

Truck-CARRIAGE, two short planks of wood, supported on two axle-trees, having four trucks of solid wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men. *■*

CARRAVEIRA, a town of Turkey in Europe, with a Greek archbishop's see. E. Long. 22. 25. N. Lat. 40. 27.

CARRICK, the southern division of the shire of Ayr in Scotland. It borders on Galloway; stretches 32 miles in length; and is a hilly country fit for pasturage. The chief rivers are the Stencher and Girven, both abounding with salmon; here are also several lakes and forests; and the people on the coast employ themselves in the herring-fishery, though they have no harbour of any consequence. The only towns of this district are Bargeny and Maybole, two inconsiderable villages, yet the first gives the title of Baron to a branch of the Hamilton Family.

CARRICK on the Sure, a town of Ireland, in the county of Tipperary and province of Munster. W. Long. 7. 14. N. Lat. 52. 16.

CARRICK-Fergus, a town of Ireland, in the county of Antrim and province of Ulster; it is a borough and market-town, very rich and populous, with a good harbour and cattle, and sends two members to parliament. It is seated on the Irish channel, on a bay of the same name.

CARRIER, is a person that carries goods for others for hire. A common carrier having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an inn-keeper who refuses to entertain a guest. See *ASSUMPSIT*.

One brought a box to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks, and such like goods: upon which, the carrier took it and was robbed, and adjudged to make it good; but a special acceptance, as, *provided there is no charge of money*, would have excused the carrier.—A person delivered to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and told him that it was *£. 200*, and took his receipt for

the same, with promise of delivery for *10s. per cent.* carriage and risk: though it be proved that there was *£. 400* in the bags, if the carrier be robbed, he shall answer only for *£. 200*, because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a common carrier loses goods which he is intrusted to carry, a special action on the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. An action will lie against a porter, carrier, or barge-man, upon his bare receipt of the goods, if they are lost through negligence. Also a lighter-man spoiling goods he is to carry, by letting water come to them, action of the case lies against him, on the common custom.

CARRIER-Pigeon, a sort of pigeon used, when properly trained, to be sent with letters from one place to another. See *COLUMBA*.

Though you carry these birds hood-winked, 20, 30, nay, 60 or 100 miles, they will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Every Bashaw has a basket of these pigeons bred in the *scraglio*, which, upon any emergent occasion, as an insurrection, or the like, he dispatches, with letters braced under their wings, to the *seraglio*; which proves a more speedy method, as well as a more safe one, than any other; he sends out more than one pigeon, however, for fear of accidents. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is 30 days journey, in 48 hours. This is also a very ancient practice; Hirtius and Brutus, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Taurilothenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic Games, sending it to him at *Ægina*.

CARRON, a small but remarkable river in Scotland, rising about the middle of the isthmus between the firths of Forth and Clyde. Both its source, and the place where it emptieth itself into the sea, are within the shire of Stirling, which it divides into two nearly equal parts. The whole length of its course, which is from west to east, is not above 14 miles. It falls into the firth of Forth about three miles to the north-east of Falkirk. The stream thereof is but small, and scarce deserves the notice of a traveller; yet there is no river in Scotland, and few in the whole island of Britain, whose banks have been the scene of so many memorable transactions. When the Roman empire was in all its glory, and had its eastern frontiers upon the Euphrates, the banks of Carron were its boundaries upon the north-west; for the wall of Antoninus*, which was raised to mark the limits of that mighty empire, stood in the neighbourhood of this river, and ran parallel to it for several miles.

Near the middle of its course, in a pleasant valley, stand two beautiful mounts, called the *Hills of Dunipace*, which are taken notice of by most of the Scottish historians as monuments of great antiquity. The whole

Carron.

whole structure of these mounds is of earth; but they are not both of the same form and dimensions. The more easterly one is perfectly round, resembling an oven, and about fifty feet in height: And that this is an artificial work does not admit of the least doubt; but we cannot affirm the same, with equal certainty, of the other, though it has been generally supposed to be so too. It bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounds are now planted with firs, which, with the parish-church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of these mounds is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; *Dun* signifying a hill in the old language of this island, and *lax* "peace" in the language of Rome. The compound word, *Dunipace*, signifies "the hills of peace." And we find in history, that no less than three treaties of peace were, at different periods, entered into between the Romans and Caledonians; the first, by Severus, about the year 210; the second, soon after, by his son Caracalla; and the third, by the usurper Carausius, about the year 280; but of which of those treaties Dunipace is a monument, we do not pretend to determine. If the concurring testimony of historians and antiquaries did not agree in giving this original to these mounds, we would be tempted to conjecture that they are sepulchral monuments. Human bones and urns have been discovered in earthen fabrics of this kind in many parts of this island, and the little mounds or barrows, which are scattered in great numbers about Stonehenge in Salisbury plain are generally supposed to have been the sepulchres of the ancient Britons. See BARROWS.

From the valley of Dunipace, the river runs for some time in a deep and hollow channel, with steep banks on both sides: here it passes by the foundations of the ancient Roman bridge; not far from which, as is generally thought, was the scene of the memorable conference betwixt the Scottish patriot William Wallace, and Robert Bruce, father to the king of that name, which first opened the eyes of the latter to a just view, both of his own true interest, and that of his country.

After the river has left the village and bridge of Larbert, it soon comes up to another small valley, through the midst of which it has now worn out to itself a straight channel; whereas, in former ages, it had taken a considerable compass, as appears by the tract of the old bed, which is still visible. The high and circling banks upon the south-side, give to this valley the appearance of a spacious bay; and, according to the tradition of the country, there was once an harbour here: nor does the tradition seem altogether groundless; pieces of broken anchors have been found here, and some of them within the memory of people yet alive. The stream-tides would still flow near the place, if they were not kept back

Carron.

by the dam-head built across the river at Stenhouse; and there is reason to believe, that the frith flowed considerably higher in former ages than it does at present. In the near neighbourhood of this valley, upon the south, stand the ruins of ancient Camelon; which, after it was abandoned by the Romans, was probably inhabited, for some ages, by the natives of the country.

Another ancient monument, called Arthur's Oven, once stood upon the banks of Carron; but was, with a spirit truly Gothic, entirely demolished about thirty years ago. The corner of a small inclosure between Stenhouse and the Carron iron-works, is pointed out as the place of its situation. This is generally supposed to have been a Roman work; though it is not easy to conceive what could be their motive for erecting such a fabric, at so great a distance from any other of their works, and in a spot which, at that time, must have been very remote and unfrequented. The form of it is said to have been perfectly round, and rising perpendicular for some yards at first, but afterwards gradually contracted, till it terminated in a narrow orifice at the top. Antiquaries are not agreed whether it had been a temple, or a trophy, or a mausoleum; but the most common opinion is, that it had been a temple, and, Buchanan thinks, a temple of Terminus. Hector Boetius says, that there were benches of stone all around it, upon the inside; and that there had been a large stone for sacrificing upon, or an altar, upon the south side.

As Carron extends over the half of the isthmus, and runs so near the ancient boundaries of the Roman empire, the adjacent country fell naturally to be the scene of many battles and encounters. Historians mention a bloody battle fought near this river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century. The scenes of some of Ossian's poems were, in the opinion of the translator, upon the banks of this river. Here Fingal fought with Caracul, the son of the king of the world, supposed to have been the same with Caracalla the son of the Roman emperor Severus. Here also young Oscar, the son of Ossian, performed some of his heroic exploits. Hereabout was the stream of Crona, celebrated in the ancient compositions of the Gallic bard; possibly that now called the water of Bonny, which runs in the neighbourhood of the Roman wall, and discharges itself into Carron at Dunipace. In those poems, mention is made of a green vale upon the banks of this river, with a tomb standing in the middle of it, where young Oscar's party and the warriors of Carus met. We only take notice of this as it strengthens the conjecture hazarded above, that the mounds of Dunipace, especially the more easterly of them, were sepulchral monuments.—About the distance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the English in the beginning of the 14th century. It goes by the name of *Graham's muir*, from the valiant John Graham, who fell there, and whose grave-stone is still to be seen in the churchyard of Falkirk.

The river Carron, though it hath long since ceased to

to

Carron
Cars.Seother-
dale Canal.

to roll its stream amidst the din of arms, still preserves its fame, by lending its aid to trade and manufactures; (see the next article).—The river is navigable for some miles near its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which, its channel has of late years been straightened and much shortened, and the great Canal* has its entrance from it.

CARRON-Works, a large iron-foundry, two miles north from Falkirk in Scotland. They are conveniently situated on the banks of the Carron, three miles above its entry into the frith of Forth. Above 100 acres of land have been converted into reservoirs and pools, for water diverted from the river, by magnificent dams built about two miles above the works, which, after turning eighteen large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys their callings to the sea.

These works are the greatest of the kind in Europe, and were established in 1760. At present, the buildings are of vast extent; and the machinery, constructed by Mr Smeaton, is the first in Britain, both in elegance and correctness: there are 1600 men employed, to whom is paid weekly 650*l.* Sterling; which has greatly enriched the adjoining country: 6500 tons of iron are melted annually from the mineral with pit-coal, and cast into cannon, cylinders, &c.—In the founding of cannon, these works have lately arrived at such perfection, that they make above 5000 pieces a year, many of which are exported to foreign states; and their guns of *new construction* are the lightest and neatest now in use, not excepting brass guns; the 32 pounder ship-gun weighing 42 hundred-weight, the 6 pounder 8 hundred-weight and one half, and the other calibers in proportion.

The present proprietors are a chartered Company, with a capital of 150,000*l.* Sterling, a common seal, &c. but their stock is confined to a very few individuals.

CARROT, in Botany. See **DAUCUS**.

Deadly-CARROT. See **THAPSIA**.

CARROUSAL, a course of horses and chariots, or a magnificent entertainment exhibited by princes on some public rejoicing. It consists in a cavalcade of several gentlemen, richly dressed and equipped after the manner of ancient cavaliers, divided into squadrons, meeting in some public place, and practising jousts, tournaments, &c. The last carrouzals were in the reign of Lewis XIV.

CARS, or **KARS**, a considerable and strong town of Asia, in Armenia, seated on a river of the same name; with a castle almost impregnable. E. Long. 43. 50. N. Lat. 41. 30.

CARSE, or **Carse of Gowry**, a district of Perthshire in Scotland. It lies on the north side of the Tay, and extends 14 miles in length from Dundee to Perth, and is from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harvests of wheat as any in Great Britain. It abounds with all the necessaries of life; but from its low damp situation, the inhabitants are subject to agues, and the commonalty are in great want of firing. In this district, not far from the Tay, stands the house of

Carstairs.

Errol, which formerly belonged to the Earls of that name, the chiefs of the ancient family of Hay, hereditary countesses of Scotland.

CARSTAIRS (William), an eminent Scots Divine, whose merit and good fortune called him to act in great scenes, and to associate with men, to whose society and intercourse his birth gave him few pretensions to aspire. A small village, in the neighbourhood of Glasgow, was the place of his nativity. His father, of whom little is known, exercised the functions of a clergyman.

Young Carstairs turned his thoughts to the profession of theology; and the persecutions and oppressions of government, both in regard to civil and religious liberty, having excited his strongest indignation, it became a matter of prudence that he should prosecute his studies in a foreign university. He went accordingly to Utrecht; and his industry and attention being directed with skill, opened up and unfolded those faculties, which he was about to employ with equal honour to his country and to himself.

During his residence abroad, he became acquainted with Pensionary Fagel, and entered with warmth into the interest of the Prince of Orange. On his return to Scotland to procure a license to teach doctrines which he had studied with the greatest care, he became disgusted with the proud and insolent conduct of Archbishop Sharp, and prepared to revisit Holland; where he knew that religious liberty was respected, and where he hoped he might better his condition by the connections he had formed.

His expectations were not vain. His prudence, his reserve, and his political address, were strong recommendations of him to the Prince of Orange, whose ambition and policy were to triumph over the obstinate bigotry of the Duke of York. The enemies of popery in England were numerous and powerful; and they had entered into a scheme for the exclusion of the Duke from the throne. To forward this scheme, Carstairs engaged in transactions of equal danger and importance. Secrets of high moment were intrusted to him. He entered into correspondence with personages of distinguished rank. He was employed in personal negotiations in Holland, England, and Scotland.

When the rupture between the Prince of Orange and the Duke of York came to extremity, Carstairs attended the former in his expedition to England, and was constantly consulted by him in all affairs of delicacy and moment. The Duke, irresolute and feeble in proportion as his situation was interesting and difficult, fled from a people who had begun to sympathize with his misfortunes, and from a crown which his posterity perhaps might yet have enjoyed if he had behaved with resolution. The man, whom the celebrated Turenne had extolled for courage and military sagacity, discovered the most shameful pusillanimity. The Prince of Orange was received by a great nation as its deliverer from civil and religious oppression.

The elevation of his master promised great advantage to Carstairs. He was appointed the King's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should prevail

vail there as univerfally as in England. Carftairs, more verfant in the affairs of his native country, faw all the impropriety of this project, and the danger that would arife from the enforcing of it. His reasonings, his remonftrances, his intreaties, overcame the firmnefs of King William. He yielded to confiderations founded alike in policy and in prudence; and to Carftairs, Scotland is indebted for the full eftablifhment of its church in the prefbyterian form of government.

The death of King William was a fevere affliction to him; and it happened before that Prince had provided for him with the liberality he deferved. He was continued, however, in the office of chaplain for Scotland, by Queen Anne; and he was invited to accept the Principality of the Univerfity of Edinburgh. Placed at the head of the church, he profecuted its interefts with zeal and with integrity. Nor was his influence and activity confined to matters of religion. They were exerted with fuccefs in promoting the culture of the arts and fciences. The univerfities of Scotland owe him obligations of the higheft kind. He procured, in particular, an augmentation of the falaries of their profefors; a circumftance to which may be afcribed their reputation, as it enabled them to cultivate with fpirit the different branches of knowledge.

A zeal for truth, a love of moderation and order, prudence and humanity, diftinguifhed Principal Carftairs in an uncommon degree. His religion had no mixture of aufterity; his fecular tranfactions were attended with no imputation of artifice; and the verfatility of his talents made him pals with eafe from a court to a college.—This excellent perfon died in 1715; and in 1774 his *ftate-papers and letters*, with an account of his life, were publifhed in one vol. 4^{to} by the Rev. Dr McCormick.

CARSUGHI (Rainier), a Jefuit, born at Citerina in Tufcany, in 1647, was the author of a Latin poem, entitled, *Ar bene feribendi*, which is efteemed both for the elegance of the ftile, and for the excellent precepts it contains. He alfo wrote fome good epigrams. He died in 1709.

CARTAMA, a town of Spain in the kingdom of Granada, formerly very confiderable. It is feated at the foot of a mountain, near the river Guadala-Medina, in W. Long. 4. 28. N. Lat. 36. 40.

CART, a land-carriage with two wheels, drawn commonly by horfes, to carry heavy goods, &c. from one place to another. See MECHANICS, n^o 59.

CART-BoTE, in law, fignifies wood to be employed in making and repairing inftruments of husbandry.

CARTE (Thomas) the hiftorian, was the fon of Mr Samuel Carte, prebendary of Litchfield, and born in 1686. When he was reader in the abbey-church at Bath, he took occafion, in a 30th of January fermen, 1714, to vindicate Charles I. with refpect to the Irish maffacre, which drew him into a controverfy with Mr Chandler the diffenting minifter; and on the acceffion of the prefent royal family he refufed to take the oaths to government, and put on a lay habit. He is faid to have acted as a kind of fecretary to Bifhop Atterbury before his troubles; and in the year 1722, being accufed of high treafon, a reward of 1000*l*. was offered for apprehending him: but Queen Caroline, the great patronefs of learned

men, obtained leave for him to return home in fecurity. He publifhed, 1. An edition of Thuanus, in feven volumes folio. 2. The life of the firft Duke of Ormond, three volumes, folio. 3. The hiftory of England, four volumes folio. 4. A Collection of original letters and papers concerning the affairs of England, two volumes octavo; and fome other works. He died in April 1754.—His hiftory of England ends in 1654. His defign was to have brought it down to the Revolution; for which purpofe he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c.—He had, (as he himfelf fays, p. 43. of his vindication of a full anfwer to a letter from a by-ftander,) “ read abundance of collections relating to the time of King Charles II. and had in his power a feries of memoirs from the beginning to the end of that reign; in which all thofe intrigues and turns at court, at the latter end of that king’s life, which Bifhop Burnet, with all his goit for tales of fecret hiftory, and all his genius for conjectures, does not pretend to account for, are laid open in the cleareft and moft convincing manner; by the perfon who was moft affected by them, and had the beft reafon to know them.”—At his death, all his papers came into the hands of his widow, who afterwards married Mr Jernegan, a member of the church of Rome.

CARTE-Blanche, a fort of white paper, figned at the bottom with a perfon’s name, and fometimes alfo fealed with his feal, giving another perfon power to fuperfcribe what conditions he pleafes. Much like this, is the French *blanc figne*, a paper without writing, except a fignature at the bottom, given by contending parties to arbitrators or friends, to fill up with the conditions they judge reafonable, in order to end the difference.

CARTEL, an agreement between two ftates for the exchange of their prifoners of war.

CARTEL, fignifies alfo a letter of defiance, or a challenge to decide a controverfy either in a tournament or in a fingle combat. See DUEL.

CARTEL-Ship, a fhip commiffioned, in time of war, to exchange the prifoners of any two hostile powers; alfo to carry any particular request or propofal from one to another: for this reafon, the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war, except a fingle gun for the purpofe of firing fignals.

CARTES (Rene des), defcended of an ancient family in Touraine in France, was one of the moft eminent philofophers and mathematicians in the 17th century. At the Jefuits College at la Fleche, he made a very great progrefs in the learned languages and polite literature, and became acquainted with Father Marfenne. His father defigned him for the army; but his tender conftitution then not permitting him to expofe himfelf to fuch fatigues, he was fent to Paris, where he lunched into gaming, in which he had prodigious fuccefs. Here Marfenne perfuaded him to return to ftudy; which he perfued till he went to Holland, in May 1616, where he engaged as a volunteer among the prince of Orange’s troops. While he lay in garrifon at Breda, he wrote a *treatife on mufic*, and laid the foundation of feveral of his works. He

Cartes
Cartesians.

was at the siege of Rochelle in 1628; returned to Paris; and, a few days after his return, at an assembly of men of learning in the house of Monsignor Bagni the Pope's Nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from thence to Franeker, where he began his *metaphysical meditations*, and drew up his *discourse on meteors*. He made a short tour to England; and not far from London, made some observations concerning the declination of the magnet. He returned to Holland, where he finished his *treatise on the world*.

His books made a great noise in France; and Holland thought of nothing but discarding the old philosophy, and following his. Voetius being chosen rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of himself. In 1647, he took a journey into France, where the king settled a pension of 3000 livres upon him. Christina, queen of Sweden, having invited him into that kingdom, he went thither, where he was received with the greatest civility by her Majesty, who engaged him to attend her every morning at 5 o'clock, to instruct her in philosophy, and desired him to revise and digest all his writings which were unpublished, and to form a complete body of philosophy from them. She likewise proposed to allow him a revenue, and to form an academy of which he was to be the director. But these designs were broken off by his death in 1650. His body was interred at Stockholm, and 17 years afterwards removed to Paris, where a magnificent monument was erected to him in the church of St Genevieve du Mont. The great Dr Halley, in a paper concerning optics, observes, that though some of the ancients mention refraction as an effect of transparent mediums, Des Cartes was the first who discovered the laws of refraction, and reduced dioptrics to a science. As to his philosophy, Dr Keil, in his introduction to his examination of Dr Burnet's theory of the earth, says, that Des Cartes was so far from applying geometry to natural philosophy, that his whole system is one continued blunder on account of his negligence in that point; the laws observed by the planets in their revolutions round the sun, not agreeing with his theory of vortices. His philosophy has accordingly given way to the more accurate discoveries and demonstrations of the Newtonian system.

CARTESIANS, a sect of philosophers, who adhered to the system of Des Cartes, founded on the two following principles, the one metaphysical, the other physical. The metaphysical one is, *I think, therefore I am*; the physical principle is, that *nothing exists but substance*. Substance he makes of two kinds; the one a substance that thinks, the other a substance extended; whence actual thought, and actual extension, are the essence of substance.

The essence of matter being thus fixed in extension, the Cartesians conclude that there is no vacuum, nor any possibility thereof in nature; but that the universe is absolutely full: mere space is excluded by this principle; because, extension being implied in

VOL. III.

the idea of space, matter is so too. Upon these principles, the Cartesians explained mechanically how the world was formed, and how the present celestial phenomena came to take place. See ASTRONOMY, n° 77.

CARTHAGE, a famed city of antiquity, the capital of Africa Propria; and which, for many years, disputed with Rome the sovereignty of the world. According to Velleius Paterculus, this city was built 65, according to Justin and Trogus 72, according to others 100 or 140 years before the foundations of Rome were laid. It is on all hands agreed that the Phœnicians were the founders.

The beginning of the Carthaginian history, like that of all other nations, is obscure and uncertain. In the 7th year of Pygmalion king of Tyre, his sister Elifa, or Dido, is said to have fled, with some of her companions and vassals, from the cruelty and avarice of her brother Sichæus.

She first touched at the island of Cyprus, where she met with a priest of Jupiter, who was desirous of attending her; to which she readily consented, and fixed the priesthood in his family. At that time, it was a custom in the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea-side, there to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these, the Tyrians selected 80, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa; and at last safely landed in the province called *Africa Propria*, not far from Utica, a Phœnician city of great antiquity. The inhabitants received their countrymen with great demonstrations of joy, and invited them to settle among them. The common fable is, that the Phœnicians imposed upon the Africans in the following manner: they desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at; but were surprised, when, upon their granting it, they saw Elifa cut the hide into the smallest shreds, by which means it surrounded a large territory; in which she built the citadel called *Byrsa*. The learned, however, are now unanimous in exploding this fable; and it is certain that the Carthaginians for many years paid an annual tribute to the Africans for the ground they possessed.

The new city soon became populous and flourishing, by the accession of the neighbouring Africans, who came thither at first with a view of traffic. In a short time it became so considerable, that *Jarbas*, a neighbouring prince, thought of making himself master of it without any effusion of blood. In order to this, he desired that an embassy of ten of the most noble Carthaginians might be sent him; and, upon their arrival, proposed to them a marriage with Dido, threatening war in case of a refusal. The ambassadors, being afraid to deliver this message, told the queen that Jarbas desired some person might be sent him who was capable of civilizing his Africans; but that there was no possibility of finding any of her subjects who would leave his relations for the conversation of such barbarians. For this they were reprimanded by the queen; who told them that they ought to be ashamed

Carthage- of refusing to live in any manner for the benefit of their country. Upon this, they informed her of the true nature of their message from Jarbas; and that, according to her own decision, she ought to sacrifice herself for the good of her country. The unhappy queen, rather than submit to be the wife of such a barbarian, caused a funeral pile to be erected, and put an end to her life with a dagger.

4
She kills herself.

This is Justin's account of the death of Queen Dido, and is the most probable; Virgil's story of her amour with Æneas, being looked upon as fabulous, even in the days of Macrobius, as we are informed by that historian. How long monarchical government continued in Carthage, or what happened to this state in its infancy, we are altogether ignorant, by reason of the Punic Archives being destroyed by the Romans; so that there is a chasm in the Carthaginian history for above 300 years. It, however, appears, that, from the very beginning, the Carthaginians applied themselves to maritime affairs, and were formidable by sea in the time of Cyrus and Cambyfes. From Diodorus Siculus and Justin, it appears, that the principal support of the Carthaginians were the mines of Spain, in which country they seem to have established themselves very early. By means of the riches drawn from these mines, they were enabled to equip such formidable fleets as we are told they fitted out in the time of Cyrus or Cambyfes. Justin insinuates, that the first Carthaginian settlement in Spain happened when the city of Gades, now Cadiz, was but of late standing, or even in its infancy. The Spaniards finding this new colony begin to flourish, attacked it with a numerous army, inasmuch that the inhabitants were obliged to call in the Carthaginians to their aid. The latter very readily granted their request, and not only repulsed the Spaniards, but made themselves masters of almost the whole province in which their new city stood. By this success, they were encouraged to attempt the conquest of the whole country; but having to do with very warlike nations, they could not push their conquests to any great length at first; and it appears from the accounts of Livy and Polybius, that the greatest part of Spain remained unsubdued till the times of Hamilcar, Asdrubal, and Hannibal.

6
First treaty between Carthage and Rome.

About 503 years before the birth of Christ, the Carthaginians entered into a treaty with the Romans. It related chiefly to matters of navigation and commerce. From it we learn, that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with the coasts of Italy, and had made some attempts upon them before this time; and that, even at this early period, a spirit of jealousy had taken place between the two republics. Some time near this period, the Carthaginians had a mind to discontinue the tribute they had hitherto paid the Africans for the ground on which their city stood. But, notwithstanding all their power, they were at present unsuccessful; and at last were obliged to conclude a peace, one of the articles of which was, that the tribute should be continued.

7
Sicily invaded by the Carthaginians.

By degrees the Carthaginians extended their power over all the islands in the Mediterranean, Sicily

excepted; and for the entire conquest of this, they made vast preparations, about 480 years before Christ. Their army consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports; and with such an immense armament, they made no doubt of conquering the whole island in a single campaign. In this, however, they found themselves miserably deceived. Hamilcar their general having landed his numerous forces, invested Himera, a city of considerable importance. He carried on his attacks with the greatest assiduity; but was at last attacked in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of the greatest overthrows mentioned in history. An hundred and fifty thousand were killed in the battle and pursuit, and all the rest taken prisoners; so that of 10 mighty an army, not a single person escaped. Of the 2000 ships of war, and 3000 transports, of which the Carthaginian fleet consisted, eight ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage; but were all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the Carthaginians upon receiving the news of so terrible a disaster. Ambassadors were immediately dispatched to Sicily, with orders to conclude a peace upon any terms. They put to sea without delay; and landing at Syracuse, threw themselves at the conqueror's feet. They begged Gelon, with many tears, to receive their city into favour, and grant them a peace on whatever terms he should chuse to prescribe. He granted their request upon condition that Carthage should pay him 2000 talents of silver to defray the expences of the war; that they should build two temples, where the articles of the treaty should be lodged and kept as sacred; and that for the future they should abstain from human sacrifices. This was not thought a dear purchase of a peace for which there was such occasion; and to show their gratitude for Gelon's moderation, the Carthaginians complimented his wife Demarata with a crown of gold worth 100 talents.

From this time we find little mention of the Carthaginians for 70 years. Some time during this period, however, they had greatly extended their dominions in Africa, and likewise shaken off the tribute which gave them so much uneasiness. They had warm disputes with the inhabitants of Cyrene the capital of Cyrenaica, about a regulation of the limits of their respective territories. The consequence of these disputes was a war, which reduced both nations so low, that they agreed first to a cessation of arms, and then to a peace. At last it was agreed, that each state should appoint two commissioners, who should set out from their respective cities on the same day, and that the spot on which they met should be the boundary of both states. In consequence of this, two brothers called *Philiten* were sent out from Carthage, who advanced with great celerity, while those from Cyrene were much more slow in their motions. Whether this proceeded from accident, or design, or perfidy,

Carthage.

8
They are utterly destroyed.

9
Peace concluded.

10
Dispute with the Cyrenians.

11
Story of the *Philiten*.

Carthage. perfidy, we are not certainly informed; but, be this as it will, the Cyreneans finding themselves greatly outstripped by the Philani, accused them of breach of faith, asserting that they had set out before the time appointed, and consequently that the convention between their principals was broken. The Philani desired them to propose some expedient whereby their differences might be accommodated; promising to submit to it whatever it might be. The Cyreneans then proposed, either that the Philani should retire from the place where they were, or that they should be buried alive upon the spot. With this last condition the brothers immediately complied, and by their death gained a large extent of territory to their country. The Carthaginians ever after celebrated this as a most brave and heroic action; paid them divine honours; and endeavoured to immortalize their names by erecting two altars there, with suitable inscriptions upon them.

12 Sicily invaded anew. About the year before Christ 412, some disputes happening between the Egestines and Selinuntines, inhabitants of two cities in Sicily, the former called in the Carthaginians to their assistance; and this occasioned a new invasion of Sicily by that nation. Great preparations were made for this war; Hannibal, whom they had appointed general, was empowered to raise an army equal to the undertaking, and equip a suitable fleet. They also appointed certain funds for defraying all the expenses of the war, intending to exert their whole force to reduce the island under their subjection.

13 Emporium and Selinus taken. The Carthaginian general having landed his forces, immediately marched for Selinus. In his way he took Emporium, a town situated on the river Mazara; and having arrived at Selinus, he immediately invested it. The besieged made a very vigorous defence; but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conquerors, except the women who fled to the temples; and these escaped, not through the merciful disposition of the Carthaginians, but because they were afraid, that if driven to despair they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; 2250 escaped to Agrigentum; and the women and children, about 5000 in number, were carried away captives. At the same time the temples were plundered, and the city raised to the ground.

14 As likewise Himera. After the reduction of Selinus, Hannibal laid siege to Himera; that city he desired above all things to become master of, that he might revenge the death of his grandfather Hamilcar, who had been slain before it by Gelon. His troops, flushed with their late success, behaved with undaunted courage; but finding his battering engines not to answer his purpose sufficiently, he undermined the wall, supporting it with large beams of timber, to which he afterwards set fire, and thus laid great part of it flat on the ground. Notwithstanding this advantage, however, the Carthaginians were several times repulsed with great slaughter; but at last they became masters of the place, and treated it in the same manner as they

had done Selinus. After this, Hannibal, dismissing his Sicilian and Italian allies, returned to Africa.

Carthage. The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But as the age and infirmities of Hannibal rendered him incapable of commanding the forces alone, they joined in commission with him Imilcar the son of Hanno, one of the same family. On the landing of the Carthaginian army, all Sicily was alarmed, and the principal cities put themselves into the best state of defence they were able. The Carthaginians immediately marched to Agrigentum, and began to batter the walls with great fury. The besieged, however, defended themselves with incredible resolution, in a sally burnt all the machines raised against their city, and repulsed the enemy with great slaughter. The Syracusians in the mean time, being alarmed at the danger of Agrigentum, sent an army to its relief. On their approach they were immediately attacked by the Carthaginians; but after a sharp dispute the latter were defeated, and forced to fly to the very walls of Agrigentum, with the loss of 6000 men. Had the Agrigentine commanders now sallied out, and fallen upon the fugitives, in all probability the Carthaginian army must have been destroyed; but, either through fear or corruption, they refused to stir out of the place, and this occasioned the loss of it. Immenſe booty was found in the city; and the Carthaginians behaved with their usual cruelty, putting all the inhabitants to the sword, not excepting even those who had fled to the temples.

The next attempt of the Carthaginians was designed against the city of Gela: but the Geleans, being greatly alarmed, implored the protection of Syracuse; and, at their request, Dionysius was sent to assist them with 2000 foot and 400 horse. The Geleans were so well satisfied with his conduct, that they treated him with the highest marks of distinction; they even sent ambassadors to Syracuse to return thanks for the important services done them by sending him thither; and soon after he was appointed generalissimo of the Syracusan forces and those of their allies against the Carthaginians. In the mean time Imilcar, having raised the city of Agrigentum, made an incursion into the territories of Gela and Comarina; which having ravaged in a dreadful manner, he carried off such an immense quantity of plunder, as filled his whole camp. He then marched against the city; but though it was but indifferently fortified, he met with a very vigorous resistance; and the place held out for a long time without receiving any assistance from its allies. At last Dionysius came to its assistance with an army of 50,000 foot and 1000 horse. With these he attacked the Carthaginian camp, but was repulsed with great loss; after which, he called a council of war, the result of whose deliberations was, that since the enemy was so much superior to them in strength, it would be highly imprudent to put all to the issue of a battle; and therefore, that the inhabitants should be persuaded to abandon the country, as the only means of saving their lives. In consequence of this, a trumpet was sent to Imilcar to desire a cessation of arms till the next day, in order, as was pretended, to bury the dead, but in

Carthage.

18
Abandoned
by its inha-
bitants.

reality to give the people of Gela an opportunity of making their escape. Towards the beginning of the night the bulk of the citizens left the place; and he himself with the army followed them about midnight. To amuse the enemy, he left 2000 of his light armed troops behind him, commanding them to make fires all night, and set up loud shouts as though the army still remained in town. At day-break these took the same route as their companions, and pursued their march with great celerity. The Carthaginians finding the city deserted by the greatest part of its inhabitants, immediately entered it, putting to death all who had remained; after which, Imilcar having thoroughly plundered it, moved towards Camarina. The inhabitants of this city had been likewise drawn off by Dionysius, and it underwent the same fate with Gela.

19
Peace con-
cluded.

Notwithstanding these successes, however, Imilcar finding his army greatly weakened, partly by the casualties of war, and partly by a plague which broke out in it, sent a herald to Syracuse to offer terms of peace. His unexpected arrival was very agreeable to the Syracusians, and a peace was immediately concluded upon the following terms, *viz.* That the Carthaginians, besides their ancient acquisitions in Sicily, should still possess the countries of the Silicani, the Selinuntine, the Himereans, and Agrigentines; that the people of Gela and Camarina should be permitted to reside in their respective cities, which yet should be dismantled, upon their paying an annual tribute to the Carthaginians; that all the other Sicilians should preserve their independency except the Syracusians, who should continue in subjection to Dionysius.

20
Dionysius
breaks the
treaty.

The tyrant of Syracuse, however, had concluded this peace with no other view than to gain time, and to put himself in a condition to attack the Carthaginian territories with a greater force. Having accomplished this, he acquainted the Syracusians with his design, and they immediately approved of it; upon which he gave up to the fury of the populace, the persons and possessions of the Carthaginians who resided in Syracuse and traded there on the faith of treaties. As there were many of their ships at that time in the harbour, laden with cargoes of great value, the people immediately plundered them; and, not content with this, ransacked all their houses in a most outrageous manner. This example was followed throughout the whole island; and in the mean time Dionysius dispatched a herald to Carthage with a letter to the senate and people, telling them, that if they did not immediately withdraw their garrisons from all the Greek cities in Sicily, the people of Syracuse would treat them as enemies. With this demand, however, he did not allow them to comply; for without waiting for any answer from Carthage, he advanced with his army to Mount Eryx, near which stood the city of Motya, a Carthaginian colony of great importance, and this he immediately invested. But soon after, leaving his brother Leptines to carry on the attacks, he himself went with the greatest part of his forces to reduce the cities in alliance with the Carthaginians. He destroyed their territories with fire and sword, cut down all their trees; and then he sat down before Eggesta and Entella, most

Carthage.

of the other towns having opened their gates at his approach: but these baffling his utmost efforts, he returned to Motya, and pushed on the siege of that place with the utmost vigour.

The Carthaginians, in the mean time, though alarmed at the message sent them by Dionysius, and though reduced to a miserable situation by the plague which had broke out in their city, did not despond, but sent officers to Europe, with considerable sums, to raise troops with the utmost diligence. Ten galleys were also sent from Carthage to destroy all the ships that were found in the harbour of Syracuse. The Admiral, according to his orders, entered the harbour in the night, without being discerned by the enemy; and having sunk most of the ships he found there, returned without the loss of a man.

21
Syracusan
ships de-
stroyed.

All this while the Motyans defended themselves with incredible vigour; while their enemies, desirous of revenging the cruelties exercised upon their countrymen by the Carthaginians, fought like lions. At last the place was taken by storm, and the Greek soldiers began a general massacre. For some time Dionysius was not able to restrain their fury: but at last he proclaimed that the Motyans should fly to the Greek temples; which they accordingly did, and a stop was put to the slaughter; but the soldiers took care thoroughly to plunder the town, in which they found a great treasure.

22
Motya ta-
ken by the
Greeks.

The following spring, Dionysius invaded the Carthaginian territories, and made an attempt upon Eggesta; but here he was again disappointed. The Carthaginians were greatly alarmed at his progress; but, next year, notwithstanding a considerable loss sustained in a sea-fight with Leptines, Himilco their general landed a powerful army at Panormus, seized upon Eryx, and then advancing towards Motya, made himself master of it, before Dionysius could find any forces to his relief. He next advanced to Melana, which he likewise besieged and took; after which most of the Sicili revolted from Dionysius.

23
Greeks de-
seated at se-
by the Car-
thaginians.

Notwithstanding this defection, Dionysius, finding his forces still amount to 20,000 foot and 3000 horse, advanced against the enemy. At the same time, Leptines was sent with the Syracusan fleet against that of the Carthaginians, but with positive orders not to break the line of battle upon any account whatever. But, notwithstanding these orders, he thought proper to divide his fleet, and the consequence of this was a total defeat; above 100 of the Syracusan galleys being sunk or taken, and 20,000 of their men killed in the battle or in the pursuit. Dionysius disheartened by this misfortune, returned with his army to Syracuse, being afraid that the Carthaginian fleet might become masters of that city if he should advance to fight the land army. Himilco did not fail immediately to invest the capital; and had certainly become master of it, and consequently of the whole island, had not a most malignant pestilence obliged him to desist from all further operations. This dreadful malady made great havoc among his forces: both by sea and land; and to complete his misfortunes, Dionysius attacked him unexpectedly, totally ruined his fleet, and made himself master of his camp.

Carthage. another attack, was obliged to come to a private agreement with Dionysius; who for 300 talents consented to let him escape to Africa, with the shattered remains of his fleet and army. The unfortunate general arrived at Carthage, clad in mean and sordid attire, where he was met by a great number of people bewailing their sad and inauspicious fortune. Himilco joined them in their lamentations; and being unable to survive his misfortunes, put an end to his own life. He had left Mago in Sicily, to take care of the Carthaginian interests in the best manner he could. In order to this, Mago treated all the Sicilians subject to Carthage with the greatest humanity; and having received a considerable number of soldiers from Africa, he at last formed an army with which he ventured a battle: in this he was defeated, and driven out of the field, with the loss of 800 men; which obliged him to desist from farther attempts of that nature.

26 Notwithstanding all these terrible disasters, the Carthaginians could not forbear making new attempts upon the island of Sicily; and about the year before Christ 392, Mago landed in it with an army of 80,000 men. This attempt, however, was attended with no better success than before; Dionysius found means to reduce him to such straits for want of provisions, that he was obliged to sue for peace. This continued for nine years, at the end of which the war was renewed with various success. It continued with little interruption till the year before Christ 267, when, the Syracusan state being rent by civil dissensions, the Carthaginians thought it a proper time to exert themselves, in order to become masters of the whole island. They fitted out a great fleet, and entered into alliance with Ictas, tyrant of Leontini, who pretended to have taken Syracuse under his protection. By this treaty, the two powers engaged to assist each other, in order to expel Dionysius II. after which they were to divide the island between them. The Syracusians applied for succours to the Corinthians; and they readily sent them a body of troops under the command of Timoleon an experienced general. By a stratagem, he got his forces landed at Tauroinium. The whole of them did not exceed 1200 in number: yet with these he marched against Ictas, who was at the head of 5000 men; his army he surprised at supper, put 300 of them to the sword, and took 600 prisoners. He then marched to Syracuse, and broke into one part of the town before the enemy had any notice of his approach: here he took post, and defended himself with such resolution, that he could not be dislodged by the united power of Ictas and the Carthaginians.

28 Foolish conduct of the Carthaginian admiral. In this place he remained for some time, in expectation of a reinforcement from Corinth; till the arrival of which, he did not judge it practicable to extend his conquests.—The Carthaginians being apprized that the Corinthian succours were detained by tempestuous weather at Thurium, posted a strong squadron, under Hanno their admiral, to intercept them in their passage to Sicily. But that commander, not imagining the Corinthians would attempt a passage to Sicily in such a stormy season, left his station at Thurium, and ordering his seamen to crown themselves with

garlands, and adorn their vessels with bucklers both of the Greek and Carthaginian form, failed to Syracuse in a triumphant manner. Upon his arrival there, he gave the troops in the citadel to understand, that he had taken the succours Timoleon expected, thinking by this means to intimidate them to a surrender. But, while he thus trifled away his time, the Corinthians marched with great expedition to Rhegium, and, taking the advantage of a gentle breeze, were easily wafted over into Sicily. Mago, the Carthaginian general, was no sooner informed of the arrival of this reinforcement, than he was struck with terror, though the whole Corinthian army did not exceed 4000 men; and, soon after, fearing a revolt of his mercenaries, he weighed anchor, in spite of all the remonstrances of Ictas, and set sail for Africa. Here he no sooner arrived, than, overcome with grief and shame for his unparalleled cowardice, he laid violent hands on himself. His body was hung upon a gallows or cross, in order to deter succeeding generals from forfeiting their honour in so flagrant a manner.

After the flight of Mago, Timoleon carried all before him. He obliged Ictas to renounce his alliance with the state of Carthage, and even deposed him, and continued his military preparations with the greatest vigour. On the other hand, the Carthaginians prepared for the ensuing campaign with the greatest alacrity. An army of 70,000 men was sent over, with a fleet of 200 ships of war, and 1000 transports laden with warlike engines, armed chariots, horses, and all other sorts of provisions. This immense multitude, however, was overthrown on the banks of the Crimessus by Timoleon: 10,000 were left dead on the field of battle; and of these, above 3000 were native Carthaginians of the best families in the city. Above 15,000 were taken prisoners; all their baggage and provisions, with 200 chariots, 1000 coats of mail, and 10,000 shields, fell into Timoleon's hands. The spoil, which consisted chiefly of gold and silver, was so immense, that the whole Sicilian army was three days in collecting it and stripping the slain. After this signal victory, he left his mercenary forces upon the frontiers of the enemy, to plunder and ravage the country; while he himself returned to Syracuse with the rest of his army, where he was received with the greatest demonstrations of joy. Soon after, Ictas, grown weary of his private station, concluded a new peace with the Carthaginians; and, having assembled an army, ventured an engagement with Timoleon: but in this he was utterly defeated; and himself, with Eupolemus his son, and Enthymus general of his horse, were brought bound to Timoleon, by their own soldiers. The two first were immediately executed as tyrants and traitors, and the last murdered in cold blood; Ictas's wives and daughters were likewise cruelly put to death after a public trial. In a short time after, Mamercus another of the Carthaginian confederates was overthrown by Timoleon, with the loss of 2000 men. These misfortunes induced the Carthaginians to conclude a peace on the following terms: That all the Greek cities should be set free; that the river Halycus should be the boundary between the territories of both parties; that the natives

32
War re-
newed.

About 316 years before Christ, we find the Carthaginians engaged in another bloody war with the Sicilians, on the following occasion. Sosistratus, who had usurped the supreme authority at Syracuse, having been forced by Agathocles to raise the siege of Rhegium, returned with his shattered troops to Sicily. But soon after this unsuccessful expedition, he was obliged to abdicate the sovereignty and quit Syracuse. With him were expelled above 600 of the principal citizens, who were suspected of having formed a design to overturn the plan of government which then prevailed in the city. As Sosistratus and the exiles thought themselves ill-treated, they had recourse to the Carthaginians, who readily espoused their cause. Hereupon the Syracusians having recalled Agathocles, who had before been banished by Sosistratus, appointed him commander in chief of all their forces, principally on account of the known aversion he bore that tyrant. The war, however, did not then continue long; for Sosistratus and the exiles were quickly received again into the city, and peace was concluded with Carthage: the people of Syracuse, however, finding that Agathocles wanted to make himself absolute, exacted an oath from him, that he would do nothing to the prejudice of the democracy.

33
Agathocles
raises him-
self to the
throne of
Syracuse.

But, notwithstanding this oath, Agathocles pursued his purpose, and by a general massacre of the principal citizens of Syracuse raised himself to the throne. For some time he was obliged to keep the peace he had concluded with Carthage; but at last finding his authority established, and that his subjects were ready to second his ambitious designs, he paid no regard to his treaties, but immediately made war on the neighbouring states, which he had expressly agreed not to do, and then carried his arms into the very heart of the island. In these expeditions he was attended with such success, that in two years time he brought into subjection all the Greek part of Sicily. This being accomplished, he committed great devastations in the Carthaginian territories, their general Hamilcar not offering to give him the least disturbance. This perfidious conduct greatly incensed the people of those districts against Hamilcar, whom they accused before the senate. He died, however, in Sicily; and Hamilcar the son of Gisco was appointed to succeed him in the command of the forces.—The last place that held out against Agathocles was Messina, whither all the Syracusan exiles had retired. Papiophilus, Agathocles's general, found means to cajole the inhabitants into a treaty; which Agathocles, according to custom, paid no regard to, but, as soon as he was in possession of the town, cut off all those who had opposed his government. For, as he intended to prosecute the war with the utmost vigour against Carthage, he thought it a point of good policy to destroy as many of his Sicilian enemies as possible.

34
Defeated
by the Car-
thaginians,
and besieged
in Sy-
racuse.

The Carthaginians in the mean time having land-

ed a powerful army in Sicily, an engagement soon ensued, in which Agathocles was defeated with the loss of 7000 men. After this defeat he was obliged to shut himself up in Syracuse, which the Carthaginians immediately invested, and most of the Greek states in the island submitted to them.

Agathocles seeing himself stripped of almost all his dominions, and his capital itself in danger of falling into the hands of the enemy, formed a design which, were it not attested by writers of undoubted authority, would seem absolutely incredible. This was no less than to transfer the war into Africa, and lay siege to the enemy's capital, at a time when he himself was besieged, and only one city left to him in all Sicily. Before he departed, however, he made all the necessary preparations for the defence of the place, and appointed his brother Antandrus governor of it. He also gave permission to all who were not willing to stand the fatigues of a siege, to retire out of the city. Many of the principal citizens, Justin says 1600, accepted of this offer; but they were no sooner got out of the place, than they were cut off by parties posted on the road for that purpose. Having seized upon their estates, Agathocles raised a considerable sum, which was intended in some measure to defray the expence of the expedition; however, he carried with him only 50 talents to supply his present wants, being well assured that he should find in the enemy's country whatever was necessary for his subsistence. As the Carthaginians had a much superior fleet, they for some time kept the mouth of the harbour blocked up: but at last a fair opportunity offered; and Agathocles, hoisting sail, by the activity of his rowers soon got clear both of the port and city of Syracuse. The Carthaginians pursued him with all possible expedition; but, notwithstanding their utmost efforts, Agathocles got his troops landed with very little opposition.

Soon after his forces were landed Agathocles burnt his fleet, probably that his soldiers might behave with the greater resolution, as they saw no possibility of flying from their danger. He first advanced to a place called the *Great City*. This, after a feeble resistance, he took and plundered. From hence he marched to Tunis, which surrendered on the first summons; and Agathocles levelled both places with the ground.

The Carthaginians were at first thrown into the greatest consternation; but soon recovering themselves, the citizens took up arms with so much alacrity, that in a few days they had on foot an army of 40,000 foot and 1000 horse, with 2000 armed chariots. The command of this army they entrusted to Hanno and Bomilcar, two Generals between whom there subsisted a great animosity. This occasioned the defeat of their whole army with the loss of their camp, though all the forces of Agathocles did not exceed 14,000 in number. Among other rich spoils the conqueror found many chariots of curious workmanship, which carried 20,000 pair of fetters and manacles that the enemy had provided for the Sicilian prisoners. After this defeat, the Carthaginians, supposing themselves to have fallen under the displeasure of their deities on account of their neglecting

Carthage. glesting to sacrifice children of noble families to them, resolved to expiate this guilt. Accordingly 200 children of the first rank were sacrificed to their bloody gods, besides 300 other persons who voluntarily offered themselves to pacify the wrath of these deities.

After these expiations, Hamilcar was recalled from Sicily. When the messengers arrived, Hamilcar commanded them not once to mention the victory of Agathocles; but, on the contrary, to give out among the troops that he had been entirely defeated, his forces all cut off, and his fleet destroyed by the Carthaginians. This threw the Syracusians into the utmost despair; however, one Euryimnon, an Etolian, prevailed upon Antandrus, not to consent to a capitulation, but to stand a general assault. Hamilcar being informed of this, prepared his battering engines, and made all the necessary preparations to storm the town without delay. But while matters remained in this situation, a gally, which Agathocles had caused to be built immediately after the battle, got into the harbour of Syracuse, and acquainted the inhabitants with the certainty of Agathocles's victory. Hamilcar observing that the garrison flocked down to the port on this occasion, and expecting to find the walls unguarded, ordered his soldiers to erect scaling-ladders, and begin the intended assault. The enemy having left the ramparts quite exposed, the Carthaginians mounted them without being discerned, and had almost possessed themselves of an entire part lying between two towers, when the patrol discovered them. Upon this a warm dispute ensued; but at last the Carthaginians were repulsed with loss. Hamilcar, therefore, finding it in vain to continue the siege after such glad tidings had restored life and soul to the Syracusians, drew off his forces, and sent a detachment of 5000 men to reinforce the troops in Africa. He still entertained hopes, however, that he might oblige Agathocles to quit Africa, and return to the defence of his own dominions. He spent some time in making himself master of such cities as sided with the Syracusians; and after having brought all their allies under subjection, returned again to Syracuse, hoping to surprize it by an attack in the night-time. But being attacked while advancing through narrow passes, where his numerous army had not room to act, he was defeated with great slaughter, and himself taken prisoner, carried into Syracuse, and put to death.

43
Success of
Agathocles
in Africa.

In the mean time the Agrigentines, finding that the Carthaginians and Syracusians had greatly weakened each other by this war, thought it a proper opportunity to attempt the sovereignty of the whole island. They therefore commenced a war against both parties; and prosecuted it with such success, that in a short time they wrested many places of note both out of the hands of the Syracusians and Carthaginians.

In Africa the tyrant carried every thing before him. He reduced most of the places of any note in the territory of Carthage; and hearing that Elymas king of Libya had declared against him, he immediately entered Libya Superior, and in a great battle overthrew that prince, putting to the sword a good part of his troops, and the general who commanded them; after which he advanced against the Carthaginians

with such expedition, that he surprized and defeated them, with the loss of 2000 killed, and a great number taken prisoners. He next prepared for the siege of Carthage itself; and in order thereto advanced to a post within five miles of that city. On the other hand, notwithstanding the great losses they had already sustained, the Carthaginians, with a powerful army, encamped between him and their capital. In this situation Agathocles received advice of the defeat of the Carthaginian forces before Syracuse, and the head of Hamilcar their general. Upon this he immediately rode up to the enemy's camp, and shewing them the head, gave them an account of the total destruction of their army before Syracuse. This threw them into such consternation, that in all human probability Agathocles would have made himself master of Carthage, had not an unexpected mutiny arisen in his camp, which gave the Carthaginians an opportunity of recovering from their terror.

The year following an engagement happened, in which neither party gained any great advantage; but soon after, the tyrant, notwithstanding all his victories, found himself unable to carry on the war alone; and therefore endeavoured to gain over to his interest Ophellas, one of the captains of Alexander the Great. In this he perfectly succeeded; and, to succour his new ally the more effectually, Ophellas sent to Athens for a body of troops. Having finished his military preparations, Ophellas found his army to consist of 10,000 foot, and 600 horse, all regular troops, besides 200 chariots, and a body of 10,000 men, attended by their wives and children, as though he had been going to plant a new colony. At the head of these forces he continued his march towards Agathocles for 18 days; and then encamped at Automolæ, a city about 3000 stadia distant from the capital of his dominions. From thence he advanced thro' the Regio Syria; but found himself reduced to such extremities, that his army was in danger of perishing for want of bread, water, and other provisions. They were also greatly annoyed by serpents and wild beasts, with which that desert region abounded. The serpents made the greatest havoc among the troops; for, being of the same colour with the earth, and extremely venomous, many soldiers, who trod upon them without seeing them, were stung to death. At last, after a very fatiguing march of two months, he approached Agathocles, and encamped at a small distance from him, to the no small terror of the Carthaginians, who apprehended the most fatal consequences from this junction. Agathocles at first caressed him, and advised him to take all possible care of his troops that had undergone so many fatigues; but soon after cut him off by treachery, and then by fair words and promises persuaded his troops to serve under himself.

Agathocles now finding himself at the head of a numerous army, assumed the title of King of Africa, intending soon to complete his conquests by the reduction of Carthage. He began with the siege of Utica, which was taken by assault. After this he marched against Hippo Diarrhytus, the Biserta of the moderns, which was also taken by storm; and after this most of the people bordering upon the sea-coasts, and

and even those who inhabited the inland parts of the country, submitted to him. But in the midst of this career of success, the Sicilians formed an association in favour of liberty ; which obliged the tyrant to return home, leaving his son Archagathus to carry on the war in Africa.

Archagathus, after his father's departure, greatly extended the African conquests. He sent Eumachus at the head of a large detachment to invade some of the neighbouring provinces, while he himself, with the greatest part of his army, observed the motions of the Carthaginians. Eumachus falling into Numidia, first took the great city of Tocas, and conquered several of the Numidian cantons. Afterwards he besieged and took Phellina ; which was attended with the submission of the Aphodelodians, a nation, according to Diodorus, as black as the Ethiopians. He then reduced several cities ; and being at last elated with such a run of good fortune, resolved to penetrate into the more remote parts of Africa. Here he at first met with success ; but hearing that the barbarous nations were advancing in a formidable body to give him battle, he abandoned his conquests, and retreated with the utmost precipitation towards the sea-coasts, after having lost abundance of men.

This unfortunate expedition made a great alteration for the worse in the affairs of Archagathus. The Carthaginians being informed of Eumachus's bad success, resolved to exert themselves in an extraordinary manner to repair their former losses. They divided their forces into three bodies : one of these they sent to the sea-coasts, to keep the towns there in awe ; another they dispatched into the Mediterranean parts, to preserve the allegiance of the inhabitants there ; and the last body they ordered to the Upper Africa, to support their confederates in that country. Archagathus being apprised of the motions of the Carthaginians, divided his forces likewise into three bodies. One of these he sent to observe the Carthaginian troops on the sea-coasts, with orders to advance afterwards into the Upper Africa ; another, under the command of *Æschion*, one of his generals, he posted at a proper distance in the heart of the country, to have an eye both on the enemy there and the barbarous nations ; and with the last, which he led in person, he kept nearer Carthage, preserving a communication with the other two, in order to fend them succours, or regal them, as the exigency of affairs should require.—The Carthaginian troops sent into the heart of the country, were commanded by Hanno, a general of great experience, who being informed of the approach of *Æschion*, laid an ambuscade for him, into which he was drawn and cut off with 4000 foot and 200 horse. Himilco, who commanded the Carthaginian forces in Upper Africa, having advice of Eumachus's march, immediately advanced against him. An engagement ensued, in which the Greeks were almost totally cut off, or perished with thirst after the battle, out of 8000 foot only 30, and of 800 horse only 40, having the good fortune to make their escape.

Archagathus receiving the melancholy news of these two defeats, immediately called in the detachments he had sent out to harass the enemy, which would otherwise have been instantly cut off. He was, how-

ever, in a short time hemmed in on all sides in such a manner as to be reduced to the last extremity for want of provisions, and ready every moment to be swallowed up by the numerous forces which surrounded him. In this deplorable situation Agathocles received an express from Archagathus, acquainting him of the losses he had sustained and the scarcity of provisions he laboured under. Upon this the tyrant, leaving the care of the Sicilian war to one Leptines, by a stratagem got 18 Etruscan ships that came to his assistance out of the harbour ; and then engaging the Carthaginian squadron which lay in its neighbourhood, took five of their ships, and made all their men prisoners. By this means he became master of the port, and secured a passage into it for the merchants of all nations, which soon restored plenty to that city, where the famine before had begun to make great havoc. Supplying himself, therefore, with a sufficient quantity of necessaries for the voyage he was going to undertake, he immediately set sail for Africa.

Upon his arrival in this country, Agathocles reviewed his forces, and found them to consist of 6000 Greeks, as many Samnites, Celtes, and Etruscans ; besides 10,000 Africans, and 1500 horse. As he found his troops almost in a state of despair, he thought this a proper time for offering the enemy battle. The Carthaginians, however, did not think proper to accept the challenge ; especially as by keeping close in their camp, where they had plenty of every thing, they could starve the Greeks to a surrender without striking a stroke. Upon this Agathocles attacked the Carthaginian camp with great bravery, made a considerable impression upon it, and might perhaps have carried it, had not his mercenaries deserted him almost at the first onset. By this piece of cowardice he was forced to retire with precipitation to his camp, whither the Carthaginians pursued him very closely, doing great execution in the pursuit.

The next night, the Carthaginians sacrificed all the prisoners of distinction as a grateful acknowledgment to the gods for the victory they had gained. While they were employed in this inhuman work, the wind, suddenly rising, carried the flames to the sacred tabernacle near the altar, which was entirely consumed, as well as the general's tent, and those of the principal officers adjoining to it. A dreadful alarm took place through the whole camp, which was heightened by the great progress the fire made. For the soldiers tents consisting of very combustible materials, and the wind blowing in a most violent manner, the whole camp was almost entirely laid in ashes ; and many of the soldiers endeavouring to carry off their arms, and the rich baggage of their officers, perished in the flames. Some of those who made their escape, met with a fate equally unhappy. For, after Agathocles had received the last blow, the Africans deserted him, and were at that instant coming over in a body to the Carthaginians. These, the persons who were flying from the flames took to be the whole Syracusan army advancing in order of battle to attack their camp. Upon this, a dreadful confusion ensued. Some took to their heels ; others fell down in heaps one upon another ; and others engaged their comrades, mistaking them for the enemy. Five thousand men lost

their lives in this tumult, and the rest thought proper to take refuge within the walls of Carthage; nor could the appearance of day-light, for some time, dissipate their terrible apprehensions. In the mean time, the African deserters, observing the great confusion the Carthaginians were in, and not knowing the meaning of it, were so terrified, that they thought proper to return to the place from whence they came. The Syracusians seeing a body of troops advancing towards them in good order, concluded that the enemy were marching to attack them, and therefore immediately cried out "To arms." The flames ascending out of the Carthaginian camp into the air, and the lamentable outcries proceeding from thence, confirmed them in this opinion, and greatly heightened their confusion. The consequence was much the same as in the Carthaginian camp; for coming to blows with one another instead of the enemy, they scarce recovered their senses upon the return of light, and the infinite fray was so bloody, that it cost Agathocles 4000 men.

53
He escapes
privately.

This last disaster so disheartened the tyrant, that he immediately set about contriving means for making his escape privately; and this he at last, though with great difficulty, effected. After his departure, his two sons were immediately put to death by the soldiers, who, choosing a leader from among themselves, made peace with the Carthaginians upon the following conditions: 1. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents. 2. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay; and, 3. That the rest should be transported to Sicily, and have the city of Selinus for their habitation.

54
Causes of
the first
Punic War.

From this time, to that of their first war with the Romans, we find nothing remarkable in the history of the Carthaginians. The first Punic war, as it is commonly called, happened about 256 years before Christ. At that time, the Carthaginians were possessed of extensive dominions in Africa; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics, was as follows. The Mamertines being vanquished in battle, and reduced to great straits by Hiero king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, to that prince, with whose mild government and strict probity they were well acquainted. Accordingly, Hiero was advancing at the head of his troops to take possession of the city, when Hannibal, who at that time commanded the Carthaginian army in Sicily, prevented him by a stratagem. He came to meet Hiero, as it were to congratulate him on his victory; and amused him, while some of the Carthaginian troops filed off towards Messina. Hereupon the Mamertines, seeing their city supported by a new reinforcement, were divided into several opinions. Some were for accepting the protection of Carthage; others were for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly dispatched

to Rome, offering the possession of the city to the Romans, and in the most moving terms imploring protection. This, after some debate, was agreed to; and the consul Appius Claudius received orders to attempt a passage to Sicily, at the head of a powerful army. Being obliged to stay some time at Rome, however, one Caius Claudius, a person of great integrity and resolution, was dispatched with a few vessels to Rhegium. On his arrival there, he observed the Carthaginian squadron to be so much superior to his own, that he thought it would be little better than madness to attempt at that time to transport forces to Sicily. He crossed the straits, however, and had a conference with the Mamertines, in which he prevailed upon them all to accept of the protection of Rome; and on this he made the necessary preparations for transporting his forces. The Carthaginians being informed of the resolutions of the Romans, sent a strong squadron of galleys under the command of Hanno, to intercept the Roman fleet; and accordingly the Carthaginian admiral, coming up with them near the coast of Sicily, attacked them with great fury. During the engagement, a violent storm arose, which dashed many of the Roman vessels against the rocks, and did a vast deal of damage to their squadron, by which means Claudius was forced to retire to Rhegium, and this he accomplished with great difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them, to expostulate with the Roman general upon the infraction of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture; Claudius soon after possessing himself of Messina.

Carthage.

55
Hanno in-
tercepts the
Roman
fleet.

Such was the beginning of the first Punic war, which is said to have lasted 24 years. The first year, the Carthaginians and Syracusians laid siege to Messina; but, not acting in concert as they ought to have done, were overthrown by the Consul Appius Claudius; and this defeat so much disgusted Hiero with the Carthaginians, that he soon after concluded an alliance with the Romans. After this treaty, having no enemy to contend with but the Carthaginians, the Romans made themselves masters of all the cities on the western coast of Sicily, and at the end of the campaign carried back most of their troops with them to take up their winter-quarters in Italy.

56
Carthagi-
nians and Sy-
racusians
defeated by
the Ro-
mans.

The second year, Hanno the Carthaginian general fixed his principal magazine at Agrigentum. This place was very strong by nature, had been rendered almost impregnable by the new fortifications raised by the Carthaginians during the preceding winter, and was defended by a numerous garrison commanded by one Hannibal a general of great experience in war. For five months the Romans attempted to reduce the place by famine, and had actually brought the inhabitants to great distress, when a Carthaginian army of 50,000 foot, 6000 horse, and 60 elephants, landed at Lilybeum, and from thence marched to Heraclea, within 20 miles of Agrigentum. There the general received a deputation from some of the inhabitants of Erbesa, where the Romans had their magazines, offering to put the town into his hands. It was accordingly delivered; up and by this means the Romans became so much distressed, that they had certainly been obliged

57
Agrigen-
tum taken
by the Ro-
mans.

Carthage. to abandon their enterprize, had not Hiero supplied them with provisions. But all the assistance he was able to give could not long have supported them, as their army was so much weakened by disorders occasioned by famine, that, out of 100,000 men of whom it originally consisted, scarce a fourth part remained fit for service, and could no longer subsist on such parsimonious supplies. But in the mean time Hannibal acquainted Hanno that the city was reduced to the utmost distress; upon which he resolved to venture an engagement, which he had before declined. In this the Romans were victorious, and the city surrendered at discretion, though Hannibal with the greatest part of the garrison made their escape. This ended the campaign; and the Carthaginians being greatly chagrined at their bad success, fined Hanno of an immense sum of money, and deprived him of his command, appointing Hamilcar to succeed him in the command of the land army, and Hannibal in that of the fleet.

58 They build a fleet, The third year, Hannibal received orders to ravage the coasts of Italy; but the Romans had taken care to post detachments in such places as were most proper to prevent his landing, so that the Carthaginian found it impossible to execute his orders. At the same time, the Romans, perceiving the advantages of being masters of the sea, set about building 120 gallees. While this was doing, they made themselves masters of most of the inland cities, but the Carthaginians reduced or kept steady in their interest most of the maritime ones; so that both parties were equally successful during this campaign.

59 And defeat the Carthaginians at sea. The fourth year, Hannibal by a stratagem made himself master of 17 Roman gallees; after which he committed great ravages on the coast of Italy, whither he had advanced to take a view of the Roman fleet. But he was afterwards attacked in his turn, lost the greatest part of his ships, and with great difficulty made his own escape. Soon after he was totally defeated by the consul Duillius, with the loss of 80 ships taken, thirteen sunk, 7000 men killed, and as many taken prisoners. After this victory Duillius landed in Sicily, put himself at the head of the land forces, relieved Segesta besieged by Hamilcar, and made himself master of Macella, though defended by a numerous garrison.

60 Sicilians defeated by the Carthaginians. The fifth year, a difference arose between the Romans and their Sicilian allies, which came to such a height, that they encamped separately. Of this Hamilcar availed himself, and, attacking the Sicilians in their entrenchments, put 4000 of them to the sword. He then drove the Romans from their posts, took several cities from them, and over-ran the greatest part of the country. In the mean time, Hannibal, after his defeat, sailed with the shattered remains of his fleet to Carthage: but in order to secure himself from punishment, he sent one of his friends with all speed, before the event of the battle was known there, to acquaint the senate, that the Romans had put to sea with a good number of heavy ill-built vessels, each of them carrying some machine, the use of which the Carthaginians did not understand; and asked whether it was the opinion of the senate that Hannibal should attack them. These machines were the *corvi*, which were

then newly invented, and by means of which, chiefly, Duillius had gained the victory. The senate were unanimous in their opinion, that the Romans should be attacked; upon which the messenger acquainted them with the unfortunate event of the battle. As the senators had already declared themselves for the engagement, they spared their general's life, and, according to Polybius, even continued him in the command of the fleet. In a short time, being reinforced by a good number of gallees, and attended by some officers of great merit, he sailed for the coast of Sardinia. He had not been long here, before he was surprised by the Romans, who carried off many of his ships, and took great numbers of his men prisoners. This so incensed the rest, that they seized their unfortunate admiral, and crucified him; but who was his immediate successor, does not appear.

61 Corfica and Sardinia reduced by the Romans. The sixth year, the Romans made themselves masters of the islands of Corfica and Sardinia. Hanno, who commanded the Carthaginian forces in the latter, defended himself at a city called Olbia with incredible bravery; but being at last killed in one of the attacks, the place was surrendered, and the Romans soon became masters of the whole island.

62 The Roman army in great danger, 63 Refused to die brave of a legionary tribune. The seventh year, the Romans took the town of Mytestratum, in Sicily, from whence they marched towards Camarina, but in their way were surrounded in a deep valley, and in the most imminent danger of being cut off by the Carthaginian army. In this extremity, a legionary tribune, by name *M. Calpurnius Flamma*, desired the general to give him 200 chosen men; promising, with this small company, to find the enemy such employment as should oblige them to leave a passage open for the Roman army. He performed his promise with a bravery truly heroic; for, having seized, in spite of all opposition, an eminence, and entrenched himself on it, the Carthaginians, jealous of his design, flocked from all quarters to drive him from his post. But the brave tribune kept their whole army in play, till the consul, taking advantage of the diversion, drew his army out of the bad situation in which he had imprudently brought it. The legions were no sooner out of danger, than they hastened to the relief of their brave companions: but all they could do was to save their bodies from the insults of their enemies; for they found them all dead on the spot, except Calpurnius who lay under an heap of dead bodies all covered with wounds, but still breathing. His wounds were immediately dressed, and it fortunately happened that none of them proved mortal; and for this glorious enterprize he received a crown of *grape*.—After this the Romans reduced several cities, and drove the enemy quite out of the territory of the Agrigentines; but were repulsed with great loss before Lipara.

64 Carthaginians defeated at sea by the Romans. The eighth year, Regulus, who commanded the Roman fleet, observing that of the Carthaginians lying along the coast in disorder, sailed with a squadron of ten gallees to observe their number and strength, ordering the rest of the fleet to follow him with all expedition. But, as he drew too near the enemy, he was surrounded by a great number of Carthaginian gallees. The Romans fought with their usual bravery; but, being overpowered with numbers, were obliged to

Carthage. to yield. The consul, however, found means to make his escape, and join the rest of the fleet; and then had his full revenge of the enemy, 18 of their ships being taken, and eight sunk.

65
Regulus in-
vades Africa.
The ninth year, the Romans made preparations for invading Africa. Their fleet for this purpose consisted of 330 galleys, each of them having on board 120 foldiers and 300 rowers. The Carthaginian fleet consisted of 360 sail, and was much better manned than that of the Romans. The two fleets met near Ecnomus, a promontory in Sicily; where, after a bloody engagement which lasted the greater part of the day, the Carthaginians were entirely defeated, with the loss of 30 galleys sunk, and 63 taken with all their men. The Romans lost only 24 galleys, which were all sunk.—After this victory, the Romans having refitted their fleet, set sail for the coast of Africa, with all expedition. The first land they got sight of was Cape Hermæ, where the fleet lay at anchor for some time waiting till the galleys and transports came up. From thence they coasted along till they arrived before Clupea, a city to the east of Carthage, where they made their first descent.

66
Carthaginians in great consternation.
No words can express the consternation of the Carthaginians, on the arrival of the Romans in Africa. The inhabitants of Clupea were so terrified, that, according to Zonaras, they abandoned the place, which the Romans immediately took possession of. Having left there a strong garrison to secure their shipping, and keep the adjacent territory in awe, they moved nearer Carthage, taking a great number of towns; they likewise plundered a prodigious number of villages, laid vast numbers of noblemen's seats in ashes, and took above 20,000 prisoners. In short, having plundered and ravaged the whole country, almost to the gates of Carthage, they returned to Clupea laden with the immense booty they had acquired in the expedition.

67
Success of
Regulus.
The tenth year, Regulus pushed on his conquests with great rapidity. To oppose his progress, Hamilcar was recalled from Sicily, and with him Boslar and Afrubal were joined in command. Hamilcar commanded an army just equal to that of Regulus. The other two commanded separate bodies, which were to join him or act apart as occasion required. But, before they were in a condition to take the field, Regulus, pursuing his conquests, arrived on the banks of the *Bragada*, a river which empties itself into the sea at a small distance from Carthage. Here he had a monstrous serpent to contend with, which, according to the accounts of those days, infected the waters of the river, poisoned the air, and killed all other animals with its breath alone. When the Romans went to draw water, this huge dragon attacked them; and, twisting itself round their bodies, either squeezed them to death, or swallowed them alive. As its hard and thick scales were proof against their darts and arrows, they were forced to have recourse to the *Balistræ*, which they made use of in sieges to throw great stones, and to beat down the walls of besieged cities. With these they discharged showers of huge stones against this new enemy, and had the good luck, with one of them, to break his back-bone; which disabled him from twisting and winding his

immense body, and by that means gave the Romans an opportunity of approaching and dispatching him with their darts. But his dead body corrupted the air, and the water of the river; and spread so great an infection over the whole country, that the Romans were obliged to decamp. We are told that Regulus sent to Rome the skin of this monster, which was 120 feet long; and that it was hung up in a temple, where it was preserved to the time of the Nuntantine war.

Having passed this river, he besieged *Adir*, or *Adda*, not far from Carthage, which the enemy attempted to relieve; but as they lay encamped among hills and rocks, where their elephants, in which the main strength of their army consisted, could be of no use, Regulus attacked them in their camp, killed 17,000 of them, and took 5000 prisoners, and 18 elephants. Upon the fame of this victory, deputations came from all quarters, inasmuch that the conqueror in a few days became master of 80 towns; among which were the city and port of Utica. This increased the alarm at Carthage; which was reduced to despair, when Regulus laid siege to Tunis, a great city about nine miles from the capital. The place was taken in sight of the Carthaginians, who, from their walls, beheld all the operations of the siege, without making the least attempt to relieve it. And to complete their misfortunes, the Numidians, their neighbours, and implacable enemies, entered their territories, committing every where the most dreadful devastations, which soon occasioned a great scarcity of provisions in the city. The public magazines were soon exhausted; and, as the city was full of selfish merchants, who took advantage of the public distress, to sell provisions at an exorbitant price, a famine ensued, with all the evils which attend it.

In this extremity Regulus advanced to the very gates of Carthage; and having encamped under the walls, sent deputies to treat of a peace with the senate. The deputies were received with inexpressible joy; but the conditions they proposed were such that the senate could not hear them without the greatest indignation. They were, 1. That the Carthaginians should relinquish all claims to Sardinia, Corsica, and Sicily. 2. That they should restore to the Romans all the prisoners they had taken from them since the beginning of the war. 3. That if they cared to redeem any of their own prisoners, they should pay so much a head for them as Rome should judge reasonable. 4. That they should for ever pay the Romans an annual tribute. 5. That for the future they should fit out but one man of war for their own use, and 50 triremes to serve in the Roman fleet, at the expense of Carthage, when required by any of the future consuls. These extravagant demands provoked the senators, who loudly and unanimously rejected them; the Roman deputies, however, told them that Regulus would not alter a single letter of the proposals, and that they must either conquer the Romans or obey them.

In this extreme distress, some mercenaries arrived from Greece, among whom was a Lacedæmonian by name Xanthippus, a man of great valour and experience in war. This man, having informed himself of

army.

Carthage. the circumstances of the late battle, declared publicly, that their overthrow was more owing to their own misconduct than to the superiority of the enemy. This discourse being spread abroad, came at last to the knowledge of the senate; and by them, and even by the desire of the Carthaginian generals themselves, Xanthippus was appointed commander in chief of their forces. His first care was to discipline his troops in a proper manner. He taught them how to march, encamp, widen and close their ranks, and rally after the Lacedæmonian manner under their proper colours. He then took the field with 12,000 foot, 4000 horse, and 100 elephants. The Romans were surpris'd at the sudden alteration they observed in the enemy's conduct; but Regulus, elated with his last success, came and encamped at a small distance from the Carthaginian army in a vast plain, where their elephants and horse had room to act. The two armies were parted by a river, which Regulus boldly pass'd, by which means he left no room for a retreat in case of any misfortune. The engagement began with great fury; but ended in the total defeat of the Romans, who, except 2000 that escap'd to Clupea, were all killed, or taken prisoners; and among the latter was Regulus himself. The loss of the Carthaginians scarce exceeded 800 men.

73
The Romans utterly defeated, and Regulus taken.

74
He is cruelly wiled.

75
Carthaginians defeated by sea and land.

The Carthaginians remained on the field of battle till they had shipped the slain; and then entered their metropolis, which was almost the only place left them, in great triumph. They treated all their prisoners with great humanity, except Regulus; but as for him, he had so insulted them in his prosperity, that they could not forbear shewing the highest marks of their resentment. According to Zonaras and others, he was thrown into a dungeon, where he had only sustenance allowed him barely sufficient to keep him alive. Nay, his cruel masters, to lighten his other torments, ordered an huge elephant, at the sight of which animal, it seems, he was greatly terrified, to be constantly placed near him; which prevented him from enjoying any tranquillity or repose.

The eleventh year of this war, the Carthaginians, elated with their victory over Regulus, began to talk in a very high strain, threatening Italy itself with an invasion. To prevent this, the Romans took care to garrison all their maritime towns, and fitted out a new fleet. In the mean time, the Carthaginians besieged Clupea and Utica in vain, being obliged to abandon their enterprise, upon hearing that the Romans were equipping a fleet of 350 sail. The Carthaginians having with incredible expedition refitted their old vessels, and built a good number of new ones, met the Roman fleet off Cape Hermea. An engagement ensued, in which the Carthaginians were utterly defeated; 104 of their ships being sunk, 30 taken, and 15,000 of their soldiers and rowers killed in the action. The Romans pursued their course to Clupea, where they were no sooner landed, than they found themselves attacked by the Carthaginian army, under the two Hanno's, father and son. But, as the brave Xanthippus no longer commanded their army, notwithstanding the Lacedæmonian discipline he had introduced among them, they were routed at the very first

onset, with the loss of 9000 men, and among them many of their chief lords.

Notwithstanding all their victories, however, the Romans found themselves now obliged, for want of provisions, to evacuate both Clupea and Utica, and abandon Africa altogether. Being desirous of signifying the end of their consulate by some important conquest on Sicily, the consuls steered for that island, contrary to the advice of their pilots, who represented their danger, on account of the season being so far advanced. Their obstinacy proved the destruction of the whole fleet; for a violent storm arising, out of 370 vessels, only 80 escap'd shipwreck, the rest being swallowed up by the sea, or dashed against the rocks. This was by far the greatest loss that Rome had ever sustained; for besides the ships that were cast away with their crews, a numerous army was destroyed, with all the riches of Africa, which had been by Regulus amassed and deposited in Clupea, and were now from thence transporting to Rome. The whole coast from Pachinum to Camerina was covered with dead bodies, and wrecks of ships; so that history can scarce afford an example of such a dreadful disaster.

The twelfth year, the Carthaginians hearing of this misfortune of the Romans, renewed the war in Sicily with fresh fury, hoping the whole island, which was now left defenceless, would fall into their hands. Carthalo, a Carthaginian commander, besieged and took Agrigentum. The town he laid in ashes and demolished the walls, obliging the inhabitants to fly to Olympium. Upon the news of this success, Adrubal was sent to Sicily with a large reinforcement of troops, and 150 elephants. They likewise fitted out a squadron, with which they retook the island of Cofyra, and marched a strong body of forces into Mauritania and Numidia, to punish the people of those countries for shewing a disposition to join the Romans. In Sicily the Romans possessed themselves of Cephalodium and Panormus, but were obliged by Carthalo to raise the siege of Drepanum with great loss.

The 13th year, the Romans sent out a fleet of 260 gallies, which appeared off Lilybæum in Sicily; but finding this place too strong, they steered from thence to the eastern coast of Africa, where they made several descents, surpris'd some cities, and plundered several towns and villages. They arrived safe at Panormus, and in a few days set sail for Italy, having a fair wind till they came off Cape Palinurus, where so violent a storm overtook them, that 160 of their gallies and a great number of their transports were lost; upon which the Roman senate made a decree, that, for the future, no more than 50 vessels should be equipped; and that these should be employed only in guarding the coast of Italy, and transporting the troops into Sicily.

The 14th year, the Romans made themselves masters of Himera and Lipara in Sicily; and the Carthaginians conceiving new hopes of conquering that island, began to make fresh levies in Gaul and Spain, and to equip a new fleet. But their treasures being exhausted, they applied to Ptolemy king of Egypt, intreating him to lend them 2000 talents: but he being resolved to stand neuter, refused to comply with

However, the republic of Carthage making an effort, equipped a fleet of 200 sail, and raised an army of 30,000 men, horse and foot, and 140 elephants, appointing Adrubal commander in chief both of the fleet and army. The Romans then finding the great advantages of a fleet, resolved to equip one notwithstanding all former disasters; and while the vessels were building, two consuls were chosen, men of valour and experience, to supersede the acting ones in Sicily. Metellus, however, one of the former consuls, being continued with the title of proconsul, found means to draw Adrubal into a battle on disadvantageous terms near Panormus, and then falling upon him, gave him a most terrible overthrow. Twenty thousand of the enemy were killed, and many elephants. An hundred and four elephants were taken with their leaders, and sent to Rome, where they were hunted and put to death in the circus.

83 Lilibæum besieged by the Romans. * See Lilibæum.

The 15th year, the Romans besieged Lilibæum; and the siege continued during the rest of the first Punic war, and was the only thing remarkable that happened during that time*. The Carthaginians, on the first news of its being besieged, sent Regulus with some deputies to Rome to treat of a peace: but instead of forwarding the negotiation, he hindered it; and notwithstanding he knew the torments prepared for him at Carthage, could not be prevailed upon to stay at Rome, but returning to his enemies country, was put to a most cruel death. During this siege, the Roman fleet under Claudius Pulcher was utterly defeated by Adherbal the Carthaginian admiral. Ninety of the Roman galleys were lost in the action, 8000 of their men either killed or drowned, and 20,000 taken and sent, prisoners to Carthage; and the Carthaginians gained this signal victory without the loss of a single ship, or even a single man. Another Roman fleet met with a still s severer fate. It consisted of 120 galleies, 800 transports, and was laden with all sorts of military stores and provisions. Every one of these vessels was lost by a storm, with all they contained, not a single plank being saved that could be used again; so that the Romans found themselves once more deprived of their whole naval force.

86 Hamilcar Barcas sent into Sicily.

In the mean time, the Carthaginian soldiery having shewn a disposition to mutiny, the senate sent over Hamilcar Barcas, father of the famous Hannibal, to Sicily. He received a charte blanche from the senate to act as he thought proper; and by his excellent conduct and resolution, showed himself the greatest general of his age. He defended Eryx, which he had taken by surprise, with such vigour, that the Romans would never have been able to make themselves masters of it, had they not fitted out a new fleet at the expence of private citizens, which, having utterly defeated that of the Carthaginians, Hamilcar, notwithstanding all his valour, was obliged to yield up the place which he had so long and so bravely defended. The following articles of a peace were immediately drawn up between the two commanders.

1. The Carthaginians shall evacuate all the places

which they have in Sicily, and entirely quit that island. 2. They shall, in 20 years, pay the Romans, at equal payments every year, 2200 talents of silver, that is, £. 437,250 Sterling. 3. They shall restore the Roman captives and deserters without ransom, and redeem their own prisoners with money. 4. They shall not make war upon Hiero king of Syracuse, or his allies. These articles being agreed to, Hamilcar surrendered Eryx upon condition that all his soldiers should march out with him upon his paying for each of them 18 *Roman denarii*. Hostages were given on both sides, and deputies were sent to Rome to procure a ratification of the treaty by the senate. After the senators had thoroughly informed themselves of the state of affairs, two more articles were added, viz. 1. That 1000 talents should be paid immediately, and the 2200 in the space of 10 years at equal payments. 2. That the Carthaginians should quit all the little islands about Italy and Sicily, and never more come near them with ships of war, or raise mercenaries in those places. Necessity obliged Hamilcar to consent to these terms; but he returned to Carthage with an hatred to the Romans, which he did not even suffer to die with him, but transmitted to his son the great Hannibal.

88 Causes of the war with the mercenaries.

The Carthaginians were no sooner got out of this bloody and expensive war, than they found themselves engaged in another which was like to have proved fatal to them. It is called by ancient historians the *Libyan war*, or the war with the mercenaries. The principal occasion of it was, that when Hamilcar returned to Carthage, he found the republic so much impoverished, that, far from being able to give these troops the largesses and rewards promised them, it could not pay them their arrears. He had committed the care of transporting them to one *Gisco*, who, being an officer of great penetration, as though he had foreseen what would happen, did not ship them off all at once, but in small and separate parties, that those who came first might be paid off and sent home before the arrival of the rest. The Carthaginians at home, however, did not act with the same prudence. As the state was almost entirely exhausted by the last war, and the immense sum of money, in consequence of the peace, paid to the Romans, they judged it would be a laudable action to save something to the public. They did not therefore pay off the mercenaries in proportion as they arrived, thinking it more proper to wait till they all came together, with a view of obtaining some remission of their arrears. But being soon made sensible of their wrong conduct on this occasion, by the frequent disorders these barbarians committed in the city, they with some difficulty prevailed upon the officers to take up their quarters at Sica, and canton their troops in that neighbourhood. To induce them to this, however, they gave them a sum of money for their present subsistence, and promised to comply with their pretensions when the remainder of their troops arrived from Sicily. Here, being wholly immersed in idleness, to which they had long been strangers, a neglect of discipline ensued, and of course a petulant and licentious spirit immediately took place. They were now determined not to ac-

quiesce

Carthage.

conduct of
Hanno.

quiesce in receiving their bare pay, but to insist upon the rewards Hamilcar had promised them, and even to compel the state of Carthage to comply with their demands by force of arms. The senate being informed of the mutinous disposition of the soldiery, dispatched Hanno, one of the suffetes, to pacify them. Upon his arrival at Sica, he expatiated largely upon the poverty of the state, and the heavy taxes with which the citizens of Carthage were loaded; and therefore, instead of answering their high expectations, he desired them to be satisfied with receiving part of their pay, and remit the remainder to serve the pressing exigencies of the republic. The mercenaries being highly provoked, that neither Hamilcar, nor any other of the principal officers who commanded them in Sicily, and were the best judges of their merit, made their appearance on this occasion, but only Hanno, a person utterly unknown, and above all others utterly disagreeable to them, immediately had recourse to arms. Assembling therefore in a body to the number of 20,000, they advanced to Tunis, and immediately encamped before that city.

The Carthaginians being greatly alarmed at the approach of so formidable a body to Tunis, made large concessions to the mercenaries, in order to bring them back to their duty: but, far from being softened, they grew more insolent upon these concessions, taking them for the effects of fear; and therefore were altogether averse to thoughts of accommodation. The Carthaginians, making a virtue of necessity, shewed a disposition to satisfy them in all points, and agreed to refer themselves to the opinion of some general in Sicily, which they had all along desired; leaving the choice of such commander entirely to them. Gisco was accordingly pitched upon to mediate this affair, the mercenaries believing Hamilcar to have been a principal cause of the ill treatment they met with, since he never appeared among them, and, according to the general opinion, had voluntarily resigned his commission. Gisco soon arrived at Tunis with money to pay the troops; and, after conferring with the officers of the several nations apart, he harangued them in such a manner that a treaty was upon the point of being concluded, when Spendius and Mathos, two of the principal mutineers, occasioned a tumult in every part of the camp. Spendius was by nation a Campanian, who had been a slave at Rome, and had fled to the Carthaginians. The apprehensions he was under of being delivered to his old master, by whom he was sure to be hanged or crucified, prompted him to break off the accommodation. Mathos was an African, and free born; but as he had been active in raising the rebellion, and was well acquainted with the implacable disposition of the Carthaginians, he knew that a peace must infallibly prove his ruin. He therefore joined with Spendius, and insinuated to the Africans the danger of concluding a treaty at that juncture, which could not but leave them singly exposed to the rage of the Carthaginians. This so incensed the Africans, who were much more numerous than the troops of any other nation, that they immediately assembled in a tumultuous manner. The

foreigners soon joined them, being inspired by Spendius with an equal degree of fury. Nothing was now to be heard but the most horrid oaths and imprecations against Gisco and the Carthaginians. Whoever offered to make any remonstrance, or lend an ear to temperate counsels, was stoned to death by the enraged multitude. Nay, many persons lost their lives barely for attempting to speak, before it could be known whether they were in the interest of Spendius or the Carthaginians.

In the midst of these commotions, Gisco behaved with great firmness and intrepidity. He left no methods untried to soften the officers and calm the minds of the soldiery; but the torrent of sedition was now so strong, that there was no possibility of keeping it within bounds. They therefore seized upon the military chest, dividing the money among themselves in part of their arrears, put the person of Gisco under an arrest, and treated him as well as his attendants with the utmost indignity. Mathos and Spendius, to destroy the remotest hopes of an accommodation with Carthage, applauded the courage and resolution of their men, loaded the unhappy Gisco and his followers with irons, and formally declared war against the Carthaginians. All the cities of Africa, to whom they had sent deputies to exhort them to recover their liberty, soon came over to them, except Utica and Hippo Diarrhytus. By this means their army being greatly increased, they divided it into two parts, with one of which they moved towards Utica, whilst the other marched to Hippo, in order to besiege both places. The Carthaginians, in the mean time, found themselves ready to sink under the pressure of their misfortunes. After they had been harassed 24 years by a most cruel and destructive foreign war, they entertained some hopes of enjoying repose. The citizens of Carthage drew their particular subsistence from the rents or revenues of their lands, and the public expences from the tribute paid from Africa; all which they were not only deprived of at once, but, what was worse, had it directly turned against them. They were destitute of arms and forces either by sea or land; had made no preparations for the sustaining of a siege, or the equipping of a fleet. They suffered all the calamities incident to the most ruinous civil war; and, to complete their misery, had not the least prospect of receiving assistance from any foreign friend or ally. Notwithstanding their deplorable situation, however, they did not despond, but pursued all the measures necessary to put themselves into a posture of defence. Hanno was appointed commander in chief of all their forces; and the most strenuous efforts were made, not only to repel all the attempts of the mutineers, but even to reduce them by force of arms.

In the mean time Mathos and Spendius laid siege to Utica and Hippacra at once; but as they were carried on by detachments drawn from the army for that purpose, they remained with the main body of their forces at Tunis, and thereby cut off all communication betwixt Carthage and the continent of Africa. By this means the capital was kept in a kind of blockade. The Africans likewise harassed them by perpetual alarms, advancing to the very walls of Carthage

Carthage.

90
The mercenaries
declare war.

- Carthage. thage by day as well as by night, and treating with the utmost cruelty every Carthaginian that fell into their hands.
- 91 They are defeated by Hanno. Hanno was dispatched to the relief of Utica with a good body of forces, 100 elephants, and a large train of battering engines. Having taken a view of the enemy, he immediately attacked their entrenchments, and, after an obstinate dispute, forced them. The mercenaries lost a vast number of men; and consequently the advantages gained by Hanno were so great, that they might have proved decisive, had he made a proper use of them: But becoming secure after his victory, and his troops being every where off their duty, the mercenaries, having rallied their forces, fell upon him, cut off a vast number of his men, forced the rest to fly into the town, retook and plundered the camp, and seized all the provisions, military stores, &c. brought to the relief of the besieged. Nor was this the only instance of Hanno's military incapacity. Notwithstanding he lay encamped in the most advantageous manner near a town called *Corza*, at which place he twice overthrew the enemy, and had it in his power to have totally ruined them, he yet neglected to improve those advantages, and even suffered the mercenaries to possess themselves of the isthmus which joined the peninsula on which Carthage stood, to the continent of Africa.
- 92 He is in his turn defeated. These repeated mistakes induced the Carthaginians once more to place Hamilcar Barca at the head of their forces. He marched against the enemy with 10,000 men, horse and foot; being all the troops the Carthaginians could then assemble for their defence, a full proof of the low state to which they were at that time reduced. As Mathos, after he had possessed himself of the isthmus, had posted proper detachments in two passes on two hills facing the continent, and guarded the bridge over the Bragada, which through Hanno's neglect he had taken, Hamilcar saw little probability of engaging him upon equal terms, or indeed of coming at him. Observing, however, that on the blowing of certain winds the mouth of the river was choked up with sand, so as to become passable, though with no small difficulty, as long as these winds continued; he halted for some time at the river's mouth, without communicating his design to any person. As soon as the wind favoured his intended project, he passed the river privately by night, and immediately after his passage he drew up the troops in order of battle, and advancing into the plain where his elephants were capable of acting, moved towards Mathos, who was posted at the village near the bridge. This daring action greatly surprised and intimidated the Africans. However, Spendius, receiving intelligence of the enemy's motions, drew a body of 10,000 men out of Mathos's camp, with which he attended Hamilcar on one side, and ordered 15,000 from Utica to observe him on the other, thinking by this means to surround the Carthaginians, and cut them all off at one stroke. By feigning a retreat, Hamilcar found means to engage them at a disadvantage; and gave them a total overthrow, with the loss of 6000 killed, and 2000 taken prisoners. The rest fled, some to the town at the bridge, and others to the camp at Utica. He did not give them time to
- recover from their defeat, but pursued them to the town near the bridge before-mentioned; which he entered without opposition, the mercenaries flying in great confusion to Tunis; and upon this many towns submitted of their own accord to the Carthaginians, whilst others were reduced by force.
- Notwithstanding these disasters, Mathos pushed on the siege of Hippo with great vigour, and appointed Spendius and Autaritus, commanders of the Gauls, with a strong body to observe the motions of Hamilcar. These two commanders, therefore, at the head of a choice detachment of 6000 men drawn out of the camp at Tunis, and 2000 Gallic horse, attended the Carthaginian general, approaching him as near as they could with safety, and keeping close to the skirts of the mountains. At last Spendius, having received a strong reinforcement of Africans and Numidians, and possessing himself of all the heights surrounding the plain in which Hamilcar lay encamped, resolved not to let slip so favourable an opportunity of attacking him. Had a battle now ensued, Hamilcar and his army must in all probability have been cut off; but by the desertion of one Naravasis, a young Numidian nobleman, with 2000 men, he found himself enabled to offer his enemies battle. The fight was obstinate and bloody; but at last the mercenaries were entirely overthrown, with the loss of 10,000 men killed, and 4000 taken prisoners. All the prisoners that were willing to enlist in the Carthaginian service, Hamilcar received among his troops, supplying them with the arms of the soldiers who had fallen in the engagement. To the rest he gave full liberty to go where they pleased; upon condition that they should never for the future bear arms against the Carthaginians; informing them at the same time, however, that as many violators of this agreement as fell into his hands must expect to find no mercy.
- Mathos and his associates, fearing that this affected lenity of Hamilcar might occasion a desertion among the troops, thought that the best expedient would be to put them upon some action so execrable in its nature that no hopes of reconciliation might remain. By their advice, therefore, Gilco and all the Carthaginian prisoners were put to death; and when Hamilcar sent to demand the remains of his countrymen, he received for answer, that whoever presumed hereafter to come upon that errand should meet with Gilco's fate: after which they came to a resolution to treat with the same barbarity all such Carthaginians as should fall into their hands. In return for this enormity, Hamilcar threw all the prisoners that fell into his hands to be devoured by wild beasts; being convinced that compassion served only to make his enemies more fierce and untractable.
- The war was now carried on generally to the advantage of the Carthaginians; nevertheless the malecontents still found themselves in a capacity to take the field with an army of 50,000 men. They watched Hamilcar's motions; but kept on the hills, carefully avoiding to come down into the plains, on account of the Numidian horse and Carthaginian elephants. Hamilcar, being much superior in skill to any of their generals, at last shut them up in a post so situated that it was impossible to get out of it. Here

he kept them strictly besieged; and the mercenaries, not daring to venture a battle, began to fortify their camp, and surround it with ditches and intrenchments. They were soon pressed by famine so forcibly, that they were obliged to eat one another; but they were driven desperate by the consciousness of their guilt, and therefore did not desire any terms of accommodation. At last, being reduced to the utmost extremity of misery, they insisted that Spendius, Autaritus, and Zaxas, their leaders, should in person have a conference with Hamilcar, and make proposals to him. Peace was accordingly concluded upon the following terms, *viz.* That ten of the ringleaders of the malecontents should be left entirely to the mercy of the Carthaginians; and that the troops should all be disarmed, every man retiring only in a single coat. The treaty was no sooner concluded, than Hamilcar, by virtue of the first article, seized upon the negotiators themselves; and the army being informed that their chiefs were under arrest, had immediately recourse to arms, as suspecting they were betrayed; but Hamilcar, drawing out his army in order of battle, surrounded them, and either cut them to pieces, or trod them to death with his elephants. The number of wretches who perished on this occasion, amounted to above 40,000.

98
42,000 of
them de-
stroyed.

After the destruction of this army, Hamilcar invaded Tunis, whither Mathos had retired with all his remaining forces. Hamilcar had another general, named Hannibal, joined in the command with him. Hannibal's quarter was on the road leading to Carthage, and Hamilcar's on the opposite side. The army was no sooner encamped, than Hamilcar caused Spendius, and the rest of the prisoners, to be led out in the view of the besieged, and crucified near the walls. Mathos, however, observing that Hannibal did not keep so good a guard as he ought to have done, made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cross, Mathos immediately substituted Hannibal in its room; and 30 Carthaginian prisoners of distinction were crucified around him. Upon this disaster, Hamilcar immediately decamped, and posted himself along the sea-coast, near the mouth of the river Bagrada.

99
Hannibal
taken and
crucified by
Mathos.

The senate, though greatly terrified by this unexpected blow, omitted no means necessary for their preservation. They sent 30 senators, with Hanno at their head, to consult with Hamilcar about the proper measures for putting an end to this unnatural war, conjuring, in the most pressing manner, Hanno to be reconciled to Hamilcar, and to sacrifice his private resentment to the public benefit. This, with some difficulty, was effected; and the two generals came to a full resolution to act in concert for the good of the public. The senate, at the same time, ordered all the youth capable of bearing arms to be pressed into the service; by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now defeated the enemy in all encounters, drew Mathos into frequent ambuscades, and gave him one notable overthrow near Leptis. This reduced the rebels to

100

tirely de-
feated and
taken pri-
soner.

the necessity of hazarding a decisive battle, which proved fatal to them. The mercenaries fled almost at the first onset; most of their army fell in the field of battle, and in the pursuit. Mathos, with a few, escaped to a neighbouring town, where he was taken alive, carried to Carthage, and executed; and then, by the reduction of the revolted cities, an end was put to this war, which, from the excesses of cruelty committed in it, according to Polybius, went among the Greeks by the name of the *inexpiable war*.

During the Libyan war, the Romans, upon some absurd pretences, wrested the island of Sardinia from the Carthaginians; which the latter, not being able to resist, were obliged to submit to. Hamilcar finding his country not in a condition to enter into an immediate war with Rome, formed a scheme to put it on a level with that haughty republic. This was by making an entire conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. In order to facilitate the execution of this scheme, he inspired both his son-in-law Asdrubal, and his son Hannibal, with an implacable aversion to the Romans, as the great opposers of his country's grandeur. Having completed all the necessary preparations, Hamilcar, after having greatly enlarged the Carthaginian dominions in Africa, entered Spain, where he commanded nine years, during which time he subdued many warlike nations, and amassed an immense quantity of treasure, which he distributed partly amongst his troops, and partly amongst the great men at Carthage; by which means he supported his interests with these two powerful bodies. At last, he was killed in a battle, and was succeeded by his son-in-law Asdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, now Carthagea. He made such progress in his conquests, that the Romans began to grow jealous. They did not, however, choose at present to come to an open rupture, on account of the apprehensions they were under of an invasion from the Gauls. They judged it most proper, therefore, to have recourse to milder methods; and prevailed upon Asdrubal to conclude a new treaty with them. The articles of it were, 1. That the Carthaginians should not pass the Iberus. 2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges.

Asdrubal, after having governed the Carthaginian dominions in Spain for eight years, was treacherously murdered by a Gaul whose master he had put to death. Three years before this happened, he had written to Carthage, to desire that young Hannibal, then twenty-two years of age, might be sent to him. This request was complied with, notwithstanding the opposition of Hanno; and from the first arrival of the young man in the camp, he became the darling of the whole army. The great resemblance he bore to Hamilcar, rendered him extremely agreeable to the troops. Every talent and qualification he seemed to possess that can contribute towards forming a great man.

man. After the death of Asdrubal, he was saluted general by the army with the highest demonstrations of joy. He immediately put himself in motion; and, in the first campaign, conquered the Olcades, a nation seated near the Iberus. The next year he subdued the Vaccei, another nation in that neighbourhood. Soon after, the Carpetani, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they propoed to attack Hannibal on his return from the Vaccei; but by a stratagem they were utterly defeated, and the whole nation obliged to submit.

Nothing now remained to oppose the progress of the Carthaginian arms, but the city of Saguntum. Hannibal, however, for some time, did not think proper to come to a rupture with the Romans by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Turdetani, or, as Apian calls them, the *Torbolæte*, with the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage in case the general refused to give them satisfaction. They were scarce landed, when Hannibal, who was carrying on the siege of Saguntum with great vigour, sent them word that he had something else to do than to give audience to ambassadors. At last, however, he admitted them; and, in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the senate of Carthage. On their arrival in that capital, they demanded that Hannibal might be delivered up to the Romans to be punished according to his deserts; and this not being complied with, war was immediately declared between the two nations.

The Saguntines are said to have defended themselves for eight months with incredible bravery. At last, however, the city was taken, and the inhabitants were treated with the utmost cruelty. After this conquest, Hannibal put his African troops into winter-quarters, at New Carthage; but in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

The next campaign, having taken the necessary measures for securing Africa and Spain, he passed the Iberus, subdued all the nations betwixt that river and the Pyrenees, appointed Hanno commander of all the new conquered district, and immediately began his march for Italy. Upon mustering his forces, after they had been weakened by sieges, desertion, mortality, and a detachment of 10,000 foot and 1000 horse left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. As they had left their heavy baggage with Hanno, and were all light armed, Hannibal easily crossed the Pyrenees; passed by Ruscino, a frontier town of the Gauls; and arrived on the banks of the Rhone without opposition. This river he passed, notwithstanding of some opposition from the Gauls; and was for

Vol. III.

some time in doubt whether he should advance to engage the Romans, who, under Scipio, were bending their march that way, or continue his march for Italy. But, to the latter he was soon determined by the arrival of Magilus prince of the Boii, who brought rich presents with him, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favourable to Hannibal's affairs than the arrival of this prince, since there was no room to doubt the sincerity of his intentions. For the Boii bore an implacable enmity to the Romans, and had even come to an open rupture with them upon the first news that Italy was threatened with an invasion from the Carthaginians.

It is not known with certainty where Hannibal began to ascend the Alps. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and taking possession of the eminences over which the Carthaginians must necessarily pass, they continued harassing them, and were no sooner driven from one eminence than they seized on another, disputing every foot of land with the enemy, and destroying great numbers of them by the advantage they had of the ground. Hannibal, however, having found means to possess himself of an advantageous post, defeated and dispersed the enemy; and soon after took their capital city, where he found the prisoners, horses, &c. that had before fallen into the hands of the enemy, and likewise corn sufficient to serve the army for three days. At last, after a most fatiguing march of nine days, he arrived at the top of the mountains. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. As the snow was lately fallen in great plenty, and covered the ground, this sight terrified the Africans and Spaniards, who were much affected with the cold. In order therefore to encourage them, the Carthaginian general led them to the top of the highest rock on the side of Italy, and thence gave them a view of the large and fruitful plains of Insubria, acquainting them that the Gauls, whose country they saw, were ready to join them. He also pointed out to them the place wherabout Rome stood, telling them, that by climbing the Alps, they had scaled the walls of that rich metropolis; and having thus animated his troops, he decamped, and began to descend the mountains. The difficulties they met with in their descent were much greater than those they had met with while they ascended. They had indeed no enemy to contend with, except some scattered parties that came to steal rather than to fight; but the deep snows, the mountains of ice, craggy rocks, and frightful precipices, proved more terrible than any enemy. After they had for some days marched through narrow, steep, and slippery ways, they came at last to a place which neither elephants, horses, nor men could pass. The way which lay between two precipices was exceeding narrow; and the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to march round about, and attempt some other way: but all places round him being covered with snow, he found himself

Carthage. reduced to the necessity of cutting a way into the rock itself, through which his men, horses, and elephants might descend. This work was accomplished with incredible labour; and then Hannibal, having spent nine days in ascending, and six in descending the Alps, gained at length Infubria, and, notwithstanding all the disasters he had met with by the way, entered the country with all the boldness of a conqueror.

Hannibal, on his entry into Infubria, reviewed his army, when he found that of the 50,000 foot with whom he set out from New Carthage five months and 15 days before, he had now but 20,000, and that his 9000 horse were reduced to 6000. His first care, after he entered Italy, was to refresh his troops; who after so long a march, and such inexpressible hardships, looked like as many skeletons raised from the dead, or savages born in a desert. He did not, however, suffer them to languish long in idleness; but, joining the Infubrians, who were at war with the Taurinians, laid siege to Taurinum, the only city in the country, and in three days time became master of it, putting all who resisted to the sword. This struck the neighbouring barbarians with such terror, that of their own accord they submitted to the conqueror, and supplied his army with all sorts of provisions.

Scipio, the Roman general, in the mean time, who had gone in quest of Hannibal on the banks of the Rhone, was surprised to find his antagonist had crossed the Alps and entered Italy. He therefore returned with the utmost expedition. An engagement ensued near the river Ticinus, in which the Romans were defeated. The immediate consequence was, that Scipio repassed that river, and Hannibal continued his march to the banks of the Po. Here he staid two days, before he could cross that river over a bridge of boats. He then sent Mago in pursuit of the enemy, who having rallied their scattered forces, and repassed the Po, were encamped at Placentia. Afterwards having concluded a treaty with several of the Gallic cantons, he joined his brother with the rest of the army, and again offered battle to the Romans: but this they thought proper to decline; and at last the consul, being intimidated by the desertion of a body of Gauls, abandoned his camp, passed the Trebia, and posted himself on an eminence near that river. Here he drew lines round his camp, and waited the arrival of his colleague with the forces from Sicily.

Hannibal being apprised of the consul's departure, sent out the Numidian horse to harass him on his march; himself moving with the main body to support them in case of need. The Numidians arriving before the rear of the Roman army had quite passed the Trebia, put to the sword or made prisoners all the stragglers they found there. Soon after, Hannibal coming up, encamped in sight of the Roman army, on the opposite bank. Here having learned the character of the consul Sempronius lately arrived, he soon brought him to an engagement, and entirely defeated him. Ten thousand of the enemy retired to Placentia; but the rest were either killed or taken prisoners. The Carthaginians pursued the flying Romans as far as the Trebia, but did not think proper to repass that river on account of the excessive cold.

Hannibal, after this action upon the Trebia, ordered the Numidians, Celtiberians, and Lusitanians, to make incursions into the Roman territories, where they committed great devastations. During his state of inaction, he endeavoured to win the affections of the Gauls, and likewise of the allies of the Romans; declaring to the Gallic and Italian prisoners, that he had no intention of making war upon them, being determined to restore them to their liberty, and protect them against the Romans: and to confirm them in their good opinion of him, he dismissed them all without ransom.

Next year, having crossed the Apennines, and penetrated into Etruria, Hannibal received intelligence that the new consul Flaminius lay encamped with the Roman army under the walls of Arretium. Having learned the true character of this general, that he was of an haughty, fierce, and rash disposition, he doubted not of being soon able to bring him to a battle. To inflame the impetuous spirit of Flaminius, the Carthaginian general took the road to Rome, and, leaving the Roman army behind him, destroyed all the country through which he passed with fire and sword; and as that part of Italy abounded with all the elegancies as well as necessities of life, the Romans and their allies suffered an incredible loss on this occasion. The rash consul was inflamed with the utmost rage on seeing the ravages committed by the Carthaginians; and therefore, immediately approached them with great temerity, as if certain of victory. Hannibal in the mean time kept on, still advancing towards Rome, having Cortona on the left hand, and the lake Thrasymenus on the right; and at last, having drawn Flaminius into an ambuscade, entirely defeated him. The general himself, with 15,000 of his men, fell on the field of battle. A great number were likewise taken prisoners, and a body of 6000 men, who had fled to a town in Etruria, surrendered to Maherbal the next day: Hannibal lost only 1500 men on this occasion, most of whom were Gauls; though great numbers, both of his soldiers and of the Romans, died of their wounds. Being soon after informed that the consul Servilius had detached a body of 4000, or, according to Appian, 8000 horse from Ariminum, to reinforce his colleague in Etruria, Hannibal sent out Maherbal, with all the cavalry, and some of the infantry, to attack him. The Roman detachment consisted of chosen men, and was commanded by Centenius a Patrician. Maherbal had the good fortune to meet with him, and after a short dispute entirely defeated him. Two thousand of the Romans were laid dead on the spot; the rest, retiring to a neighbouring eminence, were surrounded by Maherbal's forces, and obliged next day to surrender at discretion; and this disaster, happening within a few days after the defeat at the lake Thrasymenus, almost gave the finishing stroke to the Roman affairs.

The Carthaginian army was now so much troubled with a scorbutic disorder, owing to the unwholesome encampments they had been obliged to make, and the morasses they had passed through, that Hannibal found it absolutely necessary to repose them for some time in the territory of Adria, a most pleasant and fertile

fertile country. In his various engagements with the Romans, he had taken a great number of their arms, with which he now armed his men after the Roman manner. Being now likewise master of that part of the country bordering on the sea, he found means to send an express to Carthage with the news of the glorious progress of his arms. The citizens received this news with the most joyful acclamations, at the same time coming to a resolution to reinforce their armies both in Italy and Spain with a proper number of troops.

115
Fabius Maximus named dictator.

The Romans being now in the utmost consternation, named a dictator, as was their custom in times of great danger. The person they chose to this office was Fabius Maximus, surnamed *Verrucosus*; a man as cool and cautious as Sempronius and Flaminius were warm and impetuous. He set out with a design not to engage Hannibal, but only to watch his motions, and cut off his provisions, which he knew was the most proper way to destroy him in a country so far from his own. Accordingly he followed him through Umbria and Picenum, into the territory of Adria, and then through the territories of the Marrucini and Frentani into Apulia. When the enemy marched, he followed them; when they encamped, he did the same; but for the most part on eminences, and at some distance from their camp, watching all their motions, cutting off their stragglers, and keeping them in a continual alarm. This cautious method of proceeding greatly distressed the Carthaginians, but at the same time raised discontents in his own army. But neither these discontents, nor the ravages committed by Hannibal, could prevail upon Fabius to alter his measures. The former therefore entered Campania, one of the finest countries of Italy. The ravages he committed there, raised such complaints in the Roman army, that the dictator, for fear of irritating his soldiers, was obliged to pretend a desire of coming to an engagement. Accordingly he followed Hannibal with more expedition than usual; but at the same time avoided, under various pretences, an engagement with more care than the enemy sought it. Hannibal finding he could not by any means bring the dictator to a battle, resolved to quit Campania, which he found abounding more with fruit and wine than corn, and to return into Samnium through the pass called Eribanus. Fabius concluding from his march that this was his design, got there before him, and encamped on Mount Callicula, which commanded the pass, after having placed several bodies in all the avenues leading to it.

116
He is outwitted by Hannibal.

Hannibal was for some time at a loss what to do; but at last contrived the following stratagem, which Fabius could not foresee nor guard against. Being encamped at the foot of Mount Callicula, he ordered Afridubal to pick out of the cattle taken in the country, 2000 of the strongest and nimblest oxen, to tie faggots to their horns, and to have them and the herdsmen ready without the camp. After supper, when all was quiet, the cattle were brought in good order to the hill, where Fabius had placed some Roman parties in ambush to stop the pass. Upon a signal given, the faggots on the horns of the oxen

were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush; but when the oxen, feeling the fire on their heads, began to run up and down the hills, the Romans in ambush thinking themselves surrounded on all sides, and climbing the ways where they saw least light, returned to their camp leaving the pass open to Hannibal. Fabius, though rallied by his soldiers for being thus over-reached by the Carthaginian, still continued to pursue the same plan, marched directly after Hannibal, and encamped on some eminences near him.

Soon after this, the dictator was recalled to Rome; and as Hannibal, notwithstanding the terrible ravages he had committed, had all along spared the lands of Fabius, the latter was suspected of holding a secret correspondence with the enemy. In his absence, Minucius, the general of the horse, gained some advantages, which greatly tended to increase the discontent with the dictator, inasmuch that before his return Minucius was put upon an equal footing with himself. The general of the horse proposed that each should command his day; but the dictator chose rather to divide the army, hoping by that means to save at least a part of it. Hannibal soon found means to draw Minucius to an engagement, and, by his masterly skill in laying ambushes, the Roman general was surrounded on every side, and would have been cut off with all his troops, had not Fabius hastened to his assistance and relieved him. Then the two armies uniting, advanced in good order to renew the fight: but Hannibal, not caring to venture a second action, founded a retreat, and retired to his camp; and Minucius, being ashamed of his rashness, resigned the command of the army to Fabius.

117
Minucius in great danger, is relieved by Fabius.

The year following, the Romans augmented their army to 87,000 men, horse and foot; and Hannibal being reduced to the greatest straits for want of provisions, resolved to leave Samnium, and penetrate into the heart of Apulia. Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made the Romans believe for some time that his retreat was only feigned. When the truth was discovered, Æmilius was against pursuing him: but Terentius, contrary to the opinion of all the officers in the army, except the proconsul Servilius, was obstinately bent on following the enemy; and overtook them at Cannæ, till this time an obscure village in Apulia*. A battle ensued in this place, as memorable as any mentioned in history; in which the Romans, though almost double in number to the Carthaginians, were put to flight with most terrible slaughter; at least 45,000 of them being left dead on the field of battle, and 10,000 taken prisoners in the action or pursuit. The night was spent in Hannibal's camp in feasting and rejoicings, and next day in stripping the dead bodies of the unhappy Romans; after which the victorious general invited their two camps, where he found 4000 men.

118
The Romans utterly defeated at Cannæ.

* See Liv. 26.

Carthage.

119
Consequences
of this
victory.

The immediate consequence of this victory, as Hannibal had foreseen, was a disposition of that part of Italy called the Old province, Mægia Græcia, Tarentum, and part of the territory of Capua, to submit to him. The neighbouring provinces likewise discovered an inclination to shake off the Roman yoke, but wanted first to see whether Hannibal was able to protect them. His first march was into Samnium, being informed that the Hirpini and other neighbouring nations were disposed to enter into an alliance with the Carthaginians. He advanced to Compsa, which opened its gates to him. In this place he left his heavy baggage, as well as the immense plunder he had acquired. After which he ordered his brother Mago with a body of troops destined for that purpose to possess himself of all the fortresses in Campania, the most delicious province of Italy. The humanity Hannibal had all along shewn the Italian prisoners, as well as the fame of the complete victory he had lately obtained, wrought so powerfully upon the Lucani, Bruttii, and Apulians, that they expressed an eager desire of being taken under his protection. Nay, even the Campanians themselves, a nation more obliged to the Romans than any in Italy, except the Latins, discovered an inclination to abandon their natural friends. Of this the Carthaginian general receiving intelligence, he bent his march towards Capua, not doubting, but that, by means of the popular faction there, he should easily make himself master of it; which accordingly happened. Soon after this place had made its submission, many cities of the Bruttii opened their gates to Hannibal, who ordered his brother Mago to take possession of them. Mago was then dispatched to Carthage, with the important news of the victory at Cannæ, and the consequences attending it. Upon his arrival there he acquainted the senate, that Hannibal had defeated six Roman generals, four of which were consuls, one dictator, and the other general of horse to the dictator: that he had engaged six consular armies, killed two consuls, wounded one, and driven another out of the field with scarce 50 men to attend him: that he had routed the general of the horse, who was of equal power with the consuls; and that the dictator was esteemed the only general fit to command an army, merely because he had not the courage to engage him: and as a demonstrative proof of what he advanced, he produced, according to some authors, three bushels and an half of gold rings, taken from knights and senators who had been killed in the various engagements.

122
Tactical
superiority
of every
other
general
mentioned
in history.

Hitherto we have seen Hannibal surprisingly victorious; and, indeed, if we consider what he had already done, we shall find his exploits superior to those of any other general, either ancient or modern. Other commanders have been celebrated for victories gained over barbarous and uncivilized nations. Alexander the Great invaded and over-ran the empire of Persia; but that kingdom was then sink in sloth and effeminacy, so as to be an easy conquest; but had the great commander turned his arms against the western nations who were of a more martial disposition, it is more than probable, he had not conquered so easily. Hannibal, on the other hand, lived at a time when the Romans were not only the most powerful, but the

most warlike nation in the whole world. That nation he attacked with an army of only 26,000 men, without resources either for recruits, money, or provisions, except what he could procure in the enemies country. With these he had for three years resisted the Roman armies, which had been hitherto invincible by all other nations. Their armies had been commanded by generals of different tempers, dispositions, and abilities: the losses they sustained, are by the Roman writers imputed to the faults of the generals themselves; but experience had abundantly shewn, that these commanders with all their faults were able to conquer the most warlike nations, when commanded by another than Hannibal. In the battles fought with the Romans he had destroyed 200,000 of their men, and taken 50,000 prisoners; yet from the time of the battle of Cannæ, the affairs of this great man totally declined. The reason of this is, by the Roman historians, said to be, that when he put his army into winter-quarters in Capua, he so enervated himself and his army by debaucheries in that place, that he became no longer capable of coping with the Roman forces. But this seems by no means to have been the case; for the Roman historians themselves own, that, after the battle of Cannæ, he gave their armies many and terrible defeats, and took a great number of towns in their flight.

The true reason of that reverse of fortune, which Hannibal now experienced, was his not having sufficient resources for recruiting his army. On the first news, indeed, of his success at Carthage, a body of 4000 Numidian cavalry, 40 elephants, and 1000 talents of silver, were granted by the senate. A large detachment of Spanish forces was also appointed to follow them; and that these last might be ready in due time, Mago set out immediately for Spain to raise 20,000 foot and 4000 horse there. Had this ample supply been sent with proper expedition, it is by no means probable that the Romans would have had any occasion to reflect upon Hannibal's conduct at Capua. That general would undoubtedly have obliged the haughty republic to submit to the superior force of his arms the next campaign. But, notwithstanding the influence of the Barcinian faction at Carthage, Hanno and his adherents found means not only to retard the march of the supplies intended, but even to diminish their number. Mago, through the artifices of that insatiable party, could obtain an order for only 12,000 foot and 2500 horse, and even with this inconsiderable body of troops he was sent into Spain. Hannibal being thus deserted by his country, found himself obliged to act on the defensive; his army amounting to no more now than 26,000 foot and 9000 horse. But though obliged to act in this manner, he was only hindered from conquering; the utmost efforts of the whole Roman power not being able to drive this small army out of Italy for more than 14 years.

The Romans, though greatly reduced, were not yet exhausted. They were able still to send two consular armies into the field, fully recruited and in good order; and as neither the Gauls nor Italians were natural allies of the Carthaginians, they did not fail to abandon them on the first reverse of fortune. the Romans had recovered from the consternation into which they were thrown by the defeat at Cannæ, they chose a dictator, and recalled Marcellus, the conqueror of Syracuse, from Sicily. All the young Romans, above 17 years of age, of what rank soever, were obliged to enlist themselves; as were also those who had already served their legal time. By this means four legions and 10,000 horse were soon raised in the city. The allies of Rome, the colonies, and the municipia, furnished the contingents as usual. To these were added 8000 of the youngest and strongest slaves in the city. The republic purchased them of their masters, but did not oblige them to serve without their own consent, which they gave, by answering *Volo*, "I am willing;" whence they were called *volentes*, to distinguish them from the other troops. As the Romans, after the loss of so many battles, had no swords, darts, or bucklers, left in their magazines, the *volentes* were supplied with the arms which had been formerly taken from the enemy, and hung up in the public temples and porticoes. The finances of Rome were no less exhausted; but this defect was supplied by the liberality of her citizens. The senators shewing the example, were followed first by the knights, and afterwards by all the tribes; who stripping themselves of all the gold they had, brought it to the public treasury. The senators only reserved their rings, and the *bullæ* about their childrens necks. As for the silver coin, it was now, for the first time, alloyed with copper, and increased in its value. Thus the finances were put into a good condition, and a competent army raised.

This was plainly the last effort the Romans could make; and could Hannibal have procured a sufficient supply of men and money to enable him to cope with this army, and to break it as he had done the others before, there could have been no more resistance made on their part. He began, however, to be in want of money; and to procure it, gave the Roman prisoners leave to redeem themselves. These unhappy men agreed to send ten of their body to Rome to negotiate their redemption; and Hannibal required no other security for their return but their oath. Carthalo was sent at the head of them to make proposals of peace; but upon the first news of his arrival, the dictator sent a lieger to him, commanding him immediately to depart the Roman territory, and it was resolved not to redeem the captives. Upon this Hannibal sent the most considerable of them to Carthage; and of the rest he made gladiators, obliging them to fight with one another, even relations with relations, for the entertainment of his troops.

All this time Cneius and Publius Scipio had carried on the war in Spain with great success against the Carthaginians. Adrubal had been ordered to enter Italy with his army to assist Hannibal; but being defeated by the Romans, was prevented. The dictator and senate of Rome, encouraged by this news, carried on the preparations for the next campaign with the greatest vigour, whilst Hannibal remained inactive at Capua. This inaction, however, seems to have proceeded from his expectation of succours from Africa, which never came, and which delay

occasioned his ruin. The Roman dictator now revealed from prison all criminals, and persons confined for debt, who were willing to enlist themselves. Of these he formed a body of 6000 foot, armed with the broad swords and bucklers formerly taken from the Gauls. Then the Roman army, to the number of about 25,000 men, marched out of the city, under the command of the dictator; while Marcellus kept the remains of Varro's army, amounting to about 15,000 men, at Casilinum, in readiness to march whenever there should be occasion.

Thus the Roman forces were still superior to those of Hannibal; and as they now saw the necessity of following the example of Fabius Maximus, no engagement of any consequence happened the first year after the battle of Cannæ. Hannibal made a fruitless attempt upon Nola, expecting it would be delivered up to him; but this was prevented by Marcellus who had entered that city, and falling unexpectedly from three gates, upon the Carthaginians, obliged them to retire in great confusion, with the loss of 5000 men. This was the first advantage that had been gained by the Romans where Hannibal had commanded in person, and raised the spirits of the former not a little. They were, however, greatly deceived, on hearing that the consul Posthumius Albinus, with his whole army, had been cut off by the Boii, as he was crossing a forest. Upon this it was resolved to draw all the Roman forces out of Gaul and other countries, and turn them against Hannibal; so that the Carthaginian stood daily more and more in need of those supplies, which yet never arrived from Carthage. He reduced, however, the cities of Nuceria, Casilinum, Petelia, Consentia, Croton, Locri, and several others in Great Greece, before the Romans gained any advantage over him, except that before Nola already mentioned. The Campanians, who had espoused the Carthaginian interest, raised an army of 14,000 of their own nation in favour of Hannibal, and put one Marius Albius at the head of it; but he was surprised by the consul Sempiternus, who defeated and killed him, with 2000 of his men. It was now found, that Hannibal had concluded a treaty of alliance, offensive and defensive, with Philip king of Macedon; but to prevent any disturbance from that quarter, a Roman army was sent to Macedon. Soon after this Marcellus defeated Hannibal in a pitched battle, having armed his men with long pikes used generally at sea, and chiefly in boarding of ships; by which means the Carthaginians were pierced through, while they were totally unable to hurt their adversaries with the short javelins they carried. Marcellus pursued them close; and, before they got to their camp, killed 5000, and took 600 prisoners; losing himself about 1000 men, who were trod down by the Numidian horse, commanded by Hannibal in person. After this defeat the Carthaginian general found himself deserted by 1200 of his best horse, partly Spaniards, and partly Numidians, who had crossed the Alps with him. This touched him so sensibly, that he left Campania, and retired into Apulia.

The Romans still continued to increase their forces; and Hannibal, not having the same resources, found it impossible to act against so many armies at once.

He is again
defeated,
and begins
to lose
ground.

Fabius Maximus advanced into Campania, whither Hannibal was obliged to return in order to save Capua. He ordered Hanno, however, at the head of 17,000 foot and 1700 horse, to seize Beneventum; but he was utterly defeated, scarce 2000 of his men being left alive. Hannibal himself, in the mean time, advanced to Nola, where he was again defeated by Marcellus. He now began to lose ground; the Romans retook Casilinum, Acqua in Apulia, Arpi, and Aternum; but the city of Tarentum was delivered up to him by its inhabitants. The Romans then entered Campania, and ravaged the whole country, threatening Capua with a siege. The inhabitants immediately acquainted Hannibal with their danger; but he was so intent upon reducing the citadel of Tarentum, that he could not be prevailed upon to come to their assistance. In the mean time Hanno was again utterly defeated by Fulvius, his camp taken, and he himself forced to fly into Brutium with a small body of horse. The consuls then advanced with a design to besiege Capua in form. But in their way, Sempronius Gracchus, a man of great bravery, and an excellent general, was betrayed by a Lucanian and killed, which proved a very great detriment to the republic. Capua, however, was soon after invested on all sides; and the besieged once more sent to Hannibal, who now came to their assistance with his horse, his light armed infantry, and 33 elephants. He found means to inform the besieged of the time he designed to attack the Romans, ordering them to make a vigorous sally at the same time. The Roman generals, Appius and Fulvius, upon the first news of the enemy's approach, divided their troops, Appius taking upon him to make head against the garrison, and Fulvius to defend the intrenchments against Hannibal. The former found no difficulty in repulsing the garrison; and would have entered the city with them, had he not been wounded at the very gate, which prevented him from pursuing his design. Fulvius found it more difficult to withstand Hannibal, whose troops behaved themselves with extraordinary resolution. A body of Spaniards and Numidians had even the boldness to pass the ditch, and, in spite of all opposition, climbing the ramparts, penetrated into the Roman camp; but not being properly seconded by the rest, they were all to a man cut in pieces. The Carthaginian general was so disheartened at this, especially after the garrison was repulsed, that he found a retreat, which was made in good order.

124
He marches
to Rome.

125
He surprises
and defeats
Appius.

His next attempt for the relief of Capua was to march to Rome, where he hoped his approach would strike so much terror, that the armies would be called from before Capua; and that the Capuans might not be disheartened by his sudden departure, he found means to acquaint them with his design. The news of his approach caused great consternation in the metropolis. Some of the senators were for calling all the armies in Italy into the neighbourhood of Rome, as thinking nothing less was able to resist the terrible Carthaginian. But Fabius told them that Hannibal's design was not to take Rome, but relieve Capua; upon which Fulvius was recalled to Rome with 15,000 foot, and 1000 horse; and this obliged Hannibal again to retire. He then returned before Capua so suddenly,

that he surprised Appius in his camp, drove him out of it with the loss of a great number of men, and obliged him to entrench himself on some eminences, where he expected to be soon joined by his colleague Fulvius. As Hannibal, however, now expected to have all the Roman forces upon him, he could do nothing more for the relief of Capua, which was, of consequence, obliged to submit to the Romans.

A little before the surrender of Capua, Hannibal came up with a Roman army commanded by one M. Centenius Penula, who had signalized himself on many occasions as a centurion. This rash man, being introduced to the senate, had the assurance to tell them, that if they would trust him with a body of only 5000 men, he would give a good account of Hannibal. They gave him 8000, and his army was soon increased to double that number. He engaged the Carthaginians on Hannibal's first offering him battle; but after an engagement of two hours, was defeated, himself and all his men being slain, except about 1000. Soon after, having found means to draw the praetor Cneius Fulvius into an ambuscade, Hannibal cut in pieces almost his whole army, consisting of 18,000 men. In the mean time Marcellus was making great progress in Samnium. The city of Salapia was betrayed to him; but he took other two by assault. In the last of these he found 3000 Carthaginians, whom he put to the sword; and carried off 240,000 bushels of wheat, and 110,000 of barley. This, however, was by no means a compensation for the defeat which Hannibal soon after gave the proconsul Fulvius Centumalus, whom he surprised and cut off, with 13,000 of his men.

After this defeat, the great Marcellus advanced with his army to oppose Hannibal. Various engagements happened without any thing decisive. In one of them the Romans are said to have been defeated, and in another Hannibal; but, notwithstanding these, it was neither in the power of Marcellus, nor any other Roman general, totally to defeat or disperse the army commanded by Hannibal in person. Nay, in the eleventh year of the war, Hannibal found means to decoy into an ambuscade, and cut off, the great Marcellus himself; the consequence of which was, that the Romans were obliged to raise the siege of Locri, with the loss of all their military engines.

Hitherto the Carthaginians, though no longer the favourites of fortune, had lost but little ground; but now they met with a blow which totally ruined their affairs. This was the defeat of Afrubal, Hannibal's brother, who had left Spain, and was marching to his assistance. He crossed the Pyrenees without any difficulty; and, as the silver mines had supplied him with a very considerable quantity of treasure, he not only prevailed upon the Gauls to grant him a passage through their territories, but likewise to furnish him with a considerable number of recruits. Meeting with many favourable circumstances to expedite his march, he arrived at Placentia sooner than the Romans, or even his brother Hannibal, expected. Had he continued to use the same expedition with which he set out, and hastened to join his brother, it would have been utterly impossible to have saved Rome; but, sitting

ting down before Placentia, he gave the Romans an opportunity of assembling all their forces to attack him. At last he was obliged to raise the siege, and began his march for Umbria. He sent a letter to acquaint his brother of his intended motion : but the messenger was intercepted ; and the two consuls, joined their armies, with united forces fell upon the Carthaginians. As the latter were inferior both in numbers and resolution, they were utterly defeated, and Asdrubal was killed. About the same time, Hannibal himself is said to have suffered several defeats, and was retired to Canium ; but, on the fatal news of his brother's defeat and death, he was filled with despair, and retired to the extremity of Brutium ; where, assembling all his forces, he remained for a considerable time in a state of inaction, the Romans not daring to disturb him, so formidable did they esteem him alone, though every thing about him went to wreck, and the Carthaginian affairs seemed not far from the verge of destruction. Livy tells us, that it was difficult to determine whether his conduct was more wonderful in prosperity or in adversity. Notwithstanding which, Brutium being but a small province, and many of its inhabitants being either forced into the service, or forming themselves into parties of banditti, so that a great part of it remained uncultivated, he found it a difficult matter to subsist there, especially as no manner of supplies were sent him from Carthage. The people there were as solicitous about preserving their possessions in Spain, and as little concerned about the situation of affairs in Italy, as if Hannibal had met with an uninterrupted course of success, and no disaster befallen him since he first entered that country.

142
The great
progress of
Scipio Africanus.

All their solicitude, however, about the affairs of Spain, was to no purpose ; their generals, one after another, were defeated by the Romans. They had indeed cut off the two Scipios ; but found a much more formidable enemy in the young Scipio, afterwards famous *Africanus*. He overthrew them in conjunction with Masinissa king of Numidia ; and the latter, thereafter, abandoned their interest. Soon after, Syphax, king of the Massylii, was likewise persuaded to abandon their party. Scipio also gave the Spanish Reguli a great overthrow ; and reduced the cities of New Carthage, Gades, and many other important places. At last the Carthaginians began to open their eyes when it was too late. Mago was ordered to abandon Spain, and sail with all expedition to Italy. He landed on the coast of Liguria with an army of 12,000 foot and 2000 horse ; where he surprised Genoa, and also seized upon the town and port of Savo. A reinforcement was sent him to this place, and new levies went on very briskly in Liguria ; but the opportunity was passed, and could not be recalled. Scipio having carried all before him in Spain, passed over into Africa, where he met with no enemy capable of opposing his progress. The Carthaginians then, seeing themselves on the brink of destruction, were obliged to recall their armies from Italy, in order to save their city. Mago, who had entered Insubria, was defeated by the Roman forces there ; and having retreated into the maritime parts of Liguria, met a courier who brought him orders to return

directly to Carthage. At the same time, Hannibal was likewise recalled. When the messengers acquainted him with the senate's pleasure, he expressed the utmost indignation and concern, groaning, gnashing his teeth, and scarce refraining from tears. Never banished man, according to Livy, shewed so much regret in quitting his native country, as Hannibal did at going out of that of the enemy.

The Carthaginian general was no sooner landed in Africa, than he sent out parties to get provisions for the army, and buy horses to remount the cavalry. He entered into a league with the Regulus of the *Areacida*, one of the Numidian tribes. Four thousand of Syphax's horse came over in a body to him ; but as he did not think proper to repose any confidence in them, he put them all to the sword, and distributed their horses among his troops. Vermina, one of Syphax's sons, and Mafetulus, another Numidian prince, likewise joined him with a considerable body of horse. Most of the fortresses in Masinissa's kingdom either surrendered to him upon the first summons, or were taken by force. Narce, a city of considerable note there, he made himself master of by stratagem. Tychæus, a Numidian Regulus, and faithful ally of Syphax, whose territories were famous for an excellent breed of horses, reinforcing him also with 2000 of his best cavalry, Hannibal advanced to Zama, a town about five days journey distant from Carthage, where he encamped. He thence sent out spies to observe the posture of the Romans. These being brought to Scipio, he was so far from inflicting any punishment upon them, which he might have done by the laws of war, that he commanded them to be led about the camp, in order to take an exact survey of it, and then dismissed them. Hannibal, admiring the noble assurance of his rival, sent a messenger to desire an interview with him ; which, by means of Masinissa, he obtained. The two generals, therefore, escorted by equal detachments of horse, met at Nádagara, where, by the assistance of two interpreters, they held a private conference. Hannibal flattered Scipio in the most refined and artful manner, and expatiated upon all those topics which, he thought, could influence that general to grant his nation a peace upon tolerable terms ; amongst other things, that the Carthaginians would willingly confine themselves to Africa, since such was the will of the gods, in order to procure a lasting peace, whilst the Romans would be at liberty to extend their conquests to the remotest nations. Scipio answered, that the Romans were not prompted by ambition, or any sinister views, to undertake either the former or present war against the Carthaginians ; but by justice, and a proper regard for their allies. He also observed, that the Carthaginians had, before his arrival in Africa, not only made him the same proposals, but likewise agreed to pay the Romans 5000 talents of silver, to restore all the Roman prisoners without ransom, and deliver up all their galleys. He insisted on the pernicious conduct of the Carthaginians, who had broke a truce concluded with them ; and told him, that so far from granting them more favourable terms, they ought to expect more rigorous ones ; which if Hannibal would submit to, a peace would ensue ;

enue; if not, the decision of the dispute must be left to the sword.

This conference, betwixt two of the greatest generals the world ever produced, ending without success, they both retired to their respective camps; where they informed their troops, that not only the fate of Rome and Carthage, but that of the whole world, was to be determined by them the next day. An engagement ensued*, in which, as Polybius informs us, the surprising military genius of Hannibal displayed itself in an extraordinary manner. Scipio likewise, according to Livy, passed an high encomium upon him, on account of his uncommon capacity in taking advantages, the excellent arrangement of his forces, and the manner in which he gave his orders during the engagement. The Roman general indeed, not only approved his conduct, but openly declared that it was superior to his own. Nevertheless, being vastly inferior to the enemy in horse, and the state of Carthage obliging him to hazard a battle with the Romans at no small disadvantage, Hannibal was utterly routed, and his camp taken. He fled first to Thon, and afterwards to Adrumetum, from whence he was recalled to Carthage; where being arrived, he advised his countrymen to conclude a peace with Scipio on whatever terms he thought proper to prescribe.

Thus was the second war of the Carthaginians with the Romans concluded. The conditions of peace were very humiliating to the Carthaginians. They were obliged to deliver up all the Roman deserters, fugitive slaves, prisoners of war, and all the Italians whom Hannibal had obliged to follow him. They also delivered up all their ships of war, except ten triremes, all their tame elephants, and were to train up no more of these animals for the service. They were not to engage in any war without the consent of the Romans. They engaged to pay to the Romans, in fifty years, 10,000 Euboic talents, at equal payments. They were to restore to Masinissa all they had usurped from him or his ancestors, and to enter into an alliance with him. They were also to assist the Romans both by sea and land, whenever they were called upon so to do, and never to make any levies either in Gaul or Liguria. These terms appeared so intolerable to the populace, that they threatened to plunder and burn the houses of the nobility; but Hannibal having assembled a body of 6000 foot and 500 horse at Marthama, prevented an insurrection, and by his influence completed the accommodation.

The peace between Carthage and Rome was scarce signed, when Masinissa unjustly made himself master of part of the Carthaginian dominions in Africa, under pretence that these formerly belonged to his family. The Carthaginians, through the villainous mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. The good understanding between the two powers continued for many years afterwards; but at last Masinissa violated the treaties subsisting betwixt him and the Carthaginian republic, and not a little contributed to its subversion.

After the conclusion of the peace, Hannibal still kept up his credit among his countrymen. He was intrusted with the command of an army against some neighbouring nations in Africa; but this being disagreeable to the Romans, he was removed from it, and raised to the dignity of prætor in Carthage. Here he continued for some time, reforming abuses, and putting the affairs of the republic in a better condition; but this likewise being disagreeable to the Romans, he was obliged to fly to Antiochus king of Syria. After his flight, the Romans began to look upon the Carthaginians with a suspicious eye; though, to prevent every thing of this kind, the latter had ordered two ships to pursue Hannibal, had confiscated his effects, rased his house, and by a public decree declared him an exile. Soon after, disputes arising between the Carthaginians and Masinissa, the latter, notwithstanding the manifest iniquity of his proceedings, was supported by the Romans. That prince grasping at further conquests endeavoured to embroil the Carthaginians with the Romans, by asserting that the former had received ambassadors from Perseus king of Macedon; that the senate assembled in the temple of Æsculapins in the night-time, in order to confer with them; and that ambassadors had been dispatched from Carthage to Perseus, in order to conclude an alliance with him. Not long after this, Masinissa made an irruption into the province of Tyfca, where he soon possessed himself of 70, or, as Apian will have it, 50 towns and castles. This obliged the Carthaginians to apply with great importunity to the Roman senate for redress, their hands being so tied up by an article in the last treaty, that they could not repel force by force, in case of an invasion, without their consent. Their ambassadors begged, that the Roman senate would settle once for all what dominions they were to have, that they might from thenceforth know what they had to depend upon; or if their state had any way offended the Romans, they begged that they would punish them themselves, rather than leave them exposed to the insults and vexations of so merciless a tyrant. Then prostrating themselves on the earth, they burst out into tears. But, notwithstanding the impression their speech made, the matter was left undecided; so that Masinissa had liberty to pursue his rapines as much as he pleased. But whatever villainous designs the Romans might have with regard to the republic of Carthage, they affected to shew a great regard to the principles of justice and honour. They therefore sent Cato, a man famous for committing enormities under the specious pretence of public spirit, into Africa, to accommodate all differences betwixt Masinissa and the Carthaginians. The latter very well knew their fate, had they submitted to such a mediation; and therefore appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. This *unreasonable* appeal incensed the righteous Cato, that he pronounced them a devoted people, and from that time resolved upon their destruction. For some time he was opposed by Scipio Nasica; but the people of Carthage, knowing the Romans to be their inveterate enemies, and reflecting upon the iniquitous treatment they had met with

with from them ever since the commencement of their disputes with Mafiniffa, were under great apprehensions of a visit from them. To prevent a rupture as much as possible, by a decree of the senate, they impeached Afrubal general of the army, and Carthalo commander of the auxiliary forces, together with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. They sent a deputation to Rome, to discover what sentiments were entertained there of their late conduct, and to know what satisfaction the Romans required. These messengers meeting with a cold reception, others were dispatched, who returned with the same success. This made the unhappy citizens of Carthage believe that their destruction was resolved upon; which threw them into the utmost despair. And indeed they had but too just grounds for such a melancholy apprehension, the Roman senate now discovering an inclination to fall in with Cato's measures. About the same time, the city of Utica, being the second in Africa, and famous for its immense riches, as well as its equally commodious and capacious port, submitted to the Romans. Upon the possession of so important a fortress, which, by reason of its vicinity to Carthage, might serve as a place of arms in the attack of that city, the Romans declared war against the Carthaginians without the least hesitation. In consequence of this declaration, the consuls M. Manlius Nepos, and L. Marcus Censorinus, were dispatched with an army and fleet, to begin hostilities with the utmost expedition. The land-forces consisted of 80,000 foot, and 4000 chosen horse; and the fleet of 50 quinqueremes, besides a vast number of transports. The consuls had secret orders from the senate not to conclude the operations but by the destruction of Carthage, without which, it was pretended, the republic could not but look upon all her possessions as insecure. Pursuant to the plan they had formed, the troops were first landed at Lilybæum in Sicily, from whence, after receiving a proper refreshment, it was proposed to transport them to Utica.

154
War declared by the Romans against Carthage.

The answer brought by the last ambassadors to Carthage, had not a little alarmed the inhabitants of that city. But they were not yet acquainted with the resolutions taken at Rome. They therefore sent fresh ambassadors thither, whom they invested with full powers to act as they thought proper for the good of the republic, and even to submit themselves without reserve to the pleasure of the Romans. But the most sensible persons among them did not expect any great success from this condescension, since the early submission of the Uticans had rendered it infinitely less meritorious than it would have been before. However, the Romans seemed to be in some measure satisfied with it, since they promised them their liberty, the enjoyment of their laws, and in short every thing that was dear and valuable to them. This threw them into a transport of joy, and they wanted words to extol the moderation of the Romans. But the senate immediately dashed all their hopes, by acquainting them, that this favour was granted upon condition that they would send 300 young Carthaginian noblemen of the first distinction

156
The Romans demand 300 hostages,

to the prætor Fabius at Lilybæum, within the space of 30 days, and comply with all the orders of the consuls. These hard terms filled the whole city with inexpressible grief: but the hostages were delivered; and as they arrived at Lilybæum before the 30 days were expired, the ambassadors were not without hopes of softening their hard-hearted enemy. But the consuls only told them, that upon their arrival at Utica they should learn the farther orders of the republic.

The ministers no sooner received intelligence of the Roman fleet appearing off Utica, than they repaired thither, in order to know the fate of their city. The consuls, however, did not judge it expedient to communicate all the commands of their republic at once, lest they should appear so harsh and severe, that the Carthaginians would have refused to comply with them. They first, therefore, demanded a sufficient supply of corn for the subsistence of their troops. Secondly, That they should deliver up into their hands all the tiremes they were then masters of. Thirdly, That they should put them in possession of all their military machines. And fourthly, That they should immediately convey all their arms into the Roman camp.

157
And all the Carthaginians arms, military machines, &c.

As care was taken that there should be a convenient interval of time betwixt every one of these demands, the Carthaginians found themselves ensnared, and could not reject any one of them, though they submitted to the last with the utmost reluctance and concern. Censorinus now imagining them incapable of sustaining a siege, commanded them to abandon their city, or, as Zonaras will have it, to demolish it; permitting them to build another 80 stadia from the sea, but without walls or fortifications. This terrible decree threw the senate and every one else into despair; and the whole city became a scene of horror, madness, and confusion. The citizens cursed their ancestors for not dying gloriously in the defence of their country, rather than concluding such ignominious treaties of peace, that had been the cause of the deplorable condition to which their poverty was then reduced. At length, when the first commotion was a little abated, the senators assembled and resolved to sustain a siege. They were stripped of their arms and destitute of provisions; but despair raised their courage, and made them find out expedients. They took care to shut the gates of the city; and gathered together on the ramparts great heaps of stones, to serve them instead of arms in case of a surprise. They took the malefactors out of prison, gave the slaves their liberty, and incorporated them in the militia. Afrubal was recalled, who had been sentenced to die only to please the Romans; and he was invited to employ 20,000 men he had raised against his country, in defence of it. Another Afrubal was appointed to command in Carthage; and all seemed resolute, either to save their city or perish in its ruins. They wanted arms; but, by order of the senate, the temples, porticoes, and all public buildings, were turned into work-houses, where men and women were continually employed in making arms. As they encouraged one another in their work, and lost no time in procuring

Carthage. to themselves the necessaries of life, which were brought to them at stated hours, they every day made 144 bucklers, 300 swords, 1000 darts, and 500 lances and javelins. As to ballistæ and catapultæ, they wanted proper materials for them; but their industry supplied that defect. Where iron and bræs were wanting, they made use of silver and gold, melting down the statues, vases, and even the utensils of private families; for, on this occasion, even the most covetous became liberal. As tow and flax were wanting to make cords for working the machines, the women, even those of the first rank, freely cut off their hair and dedicated it to that use. Without the walls, Aldrubal employed the troops in getting together provisions, and conveying them safe into Carthage; so that there was as great plenty there as in the Roman camp.

161
The city at-
tacked by

sed.

In the mean time the consuls delayed drawing near to Carthage, not doubting but the inhabitants, whom they imagined destitute of necessaries to sustain a siege, would, upon cool reflection, submit; but at length, finding themselves deceived in their expectation, they came before the place and invested it. As they were still persuaded that the Carthaginians had no arms, they flattered themselves that they should easily carry the city by assault. Accordingly they approached the walls in order to plant their scaling-ladders; but to their great surprise they discovered a prodigious multitude of men on the ramparts, shining in the armour they had newly made. The legionaries were so terrified at this unexpected sight, that they drew back, and would have retired, if the consuls had not led them on to the attack: which, however, proved unsuccessful; the Romans, in spite of their utmost efforts, being obliged to give over the enterprize, and lay aside all thoughts of taking Carthage by assault. In the mean time Aldrubal, having collected from all places subject to Carthage a prodigious number of troops, came and encamped within reach of the Romans, and soon reduced them to great straits for want of provisions. As Marcius, one of the Roman consuls, was posted near a marsh, the exhalations of the stagnating waters, and the heat of the season, infected the air, and caused a general sickness among his men. Marcius, therefore, ordered his fleet to draw as near the shore as possible, in order to transport his troops to an healthier place. Aldrubal being informed of this motion, ordered all the old barks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and then taking advantage of the wind, which blew towards the enemy, let them drive upon their ships, which were for the most part consumed. After this disaster, Marcius was called home to preside at the elections; and the Carthaginians, looking upon the absence of one of the consuls to be a good omen, made a brisk sally in the night; and would have surprised the consul's camp, had not Æmilianus, with some squadrons, marched out of the gate opposite to the place where the attack was made, and, coming round, fell unexpectedly on their rear, and obliged them to return in disorder to the city.

Aldrubal had posted himself under the walls of a

city named Nepheris, 24 miles distant from Carthage, and situated on an high mountain, which seemed inaccessible on all sides. From thence he made incursions into the neighbouring country, intercepted the Roman convoys, fell upon their detachments sent out to forage, and even ordered parties to insult the consular army in their camp. Hereupon the consul resolved to drive the Carthaginian from this advantageous post, and set out for Nepheris. As he drew near the hills, Aldrubal suddenly appeared at the head of his army in order of battle, and fell upon the Romans with incredible fury. The consular army sustained the attack with great resolution; and Aldrubal retired in good order to his post, hoping the Romans would attack him there. But the consul being now convinced of his danger, resolved to retire. This Aldrubal no sooner perceived, than he rushed down the hill, and falling upon the enemy's rear, cut a great number of them in pieces. The whole Roman army was now saved by the bravery of Scipio Æmilianus. At the head of 300 horse, he sustained the attack of all the forces commanded by Aldrubal, and covered the legions, while they passed a river in their retreat before the enemy. Then he and his companions threw themselves into the stream, and swam across it. When the army had crossed the river, it was perceived that four manipuli were wanting; and soon after they were informed that they had retired to an eminence, where they resolved to sell their lives as dear as possible. Upon this news Æmilianus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized an hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested, fell upon them at the head of his squadron with the boldness of a man determined to conquer or die, and in spite of all opposition opened a way for his fellow-soldiers to escape. On his return to the army, his companions, who had given him over for lost, carried him to his quarters in a kind of triumph; and the manipuli he had saved gave him a crown of *grænen*. By these and some other exploits, Æmilianus gained such reputation, that Cato, who is said never to have commended any body before, could not refuse him the praises he deserved; and is said to have foretold that Carthage would never be reduced till Scipio Æmilianus was employed in that expedition.

The next year, the war in Africa fell by lot to the consul L. Calpurnius Piso; and he continued to employ Æmilianus in several important enterprizes, in which he was attended with uncommon success. He took several castles; and in one of his excursions, found means to have a private conference with Phæmas, general, under Aldrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse, to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea; but was obliged to abandon the enterprize, with the loss of a great number of men killed by the enemy in their sallies. From this place he went to vent his

rage on a city newly built, and thence called *Neapolis*, which professed a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place, and stripped the inhabitants of all their effects. After this he laid siege to *Hippagreta*, which employed the Roman fleet and army the whole summer; and, on the approach of winter, the consul retired to Utica, without performing a single action worth notice during the whole campaign.

165
He is chosen consul.

The next year Scipio *Æmilianus* was chosen consul, and ordered to pass into Africa; and upon his arrival, the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These had seized *Megalia*, one of the suburbs of the city: but as they had not furnished themselves with provisions to subsist there, and could not retire, being closely invested on all sides by the enemy's troops; the prætor *Mancinus*, who commanded this detachment, seeing the danger into which he had brought himself, dispatched a light boat to Utica, to acquaint the Romans there with his situation. *Æmilianus* received this letter a few hours after his landing; and immediately flew to the relief of the besieged Romans, obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having then drawn together all the troops, *Æmilianus* applied himself wholly to the siege of the capital.

166
Monstrous cruelties of Afrubal.

His first attack was upon *Megalia*; which he carried by assault, the Carthaginian garrison retiring into the citadel of *Byrfa*. *Afrubal*, who had commanded the Carthaginian forces in the field, and was now governor of the city, was so enraged at the loss of *Megalia*, that he caused all the Roman captives taken in the two years the war lasted, to be brought upon the ramparts, and thrown headlong, in the sight of the Roman army, from the top of the wall; after having, with an excess of cruelty, commanded their hands and feet to be cut off, and their eyes and tongues to be torn out. He was of a temper remarkably inhuman, and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. *Æmilianus*, in the mean time, was busy in drawing lines of circumvallation and contravallation cross the neck of land which joined the isthmus on which Carthage stood to the continent. By this means, all the avenues on the land-side of Carthage being shut up, the city could receive no provisions that way. His next care was to raise a mole in the sea, in order to block up the old port, the new one being already shut up by the Roman fleet; and this great work he effected with immense labour. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port; and was 90 feet broad at the bottom, and 80 at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than surprised, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Prompted by despair, however, the Carthaginians, with incredible and almost mira-

168
The besieged dig a new basin.

culous industry, dug a new basin, and cut a passage into the sea, by which they could receive the provisions that were sent them by their troops in the field. With the same diligence and expedition, they fitted out a fleet of 50 triremes; which, to the great surprise of the Romans, appeared suddenly advancing into the sea through this new canal, and even ventured to give the enemy battle. The action lasted the whole day, with little advantage on either side. The day after, the consul endeavoured to make himself master of a terrace which covered the city on the side next the sea; and on this occasion the besieged signalized themselves in a most remarkable manner. Great numbers of them, naked and unarmed, went into the water in the dead of the night, with unlighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire in the utmost confusion. The consul, who commanded the detachment in person, and had continued all night at the foot of the terrace, endeavoured to stop his men, and even ordered those who fled to be killed. But the Carthaginians, perceiving the confusion the Romans were in, threw themselves upon them like so many wild beasts; and having put them to flight only with their torches, they set fire to the machines, and entirely consumed them. This, however, did not discourage the consul; he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it peep in Carthage on the sea-side, *Æmilianus* took care to fortify and secure it against the sallies of the enemy; and then, winter approaching, he suspended all further attacks upon the place till the return of good weather. During the winter-season, however, the consul was not inactive. The Carthaginians had a very numerous army under the command of one *Diogenes*, strongly encamped near *Nepheris*, whence convoys of provisions were sent by sea to the besieged, and brought into the new basin. To take *Nepheris*, therefore, was to deprive Carthage of her chief magazine. This *Æmilianus* undertook, and succeeded in the attempt. He first forced the enemy's entrenchments, put 70,000 of them to the sword, and made 10,000 prisoners; all the inhabitants of the country, who could not retire to Carthage, having taken refuge in this camp. After this, he laid siege to *Nepheris*, which was reduced in 22 days. *Afrubal* being disheartened by the defeat of the army, and touched with the misery of the besieged now reduced to the utmost extremity for want of provisions, offered to submit to what conditions the Romans pleased, provided the city was spared; but this was absolutely refused.

Early in the spring, *Æmilianus* renewed the siege of Carthage; and in order to open himself a way into the city, he ordered *Lælius* to attempt the reduction of *Cotho*, a small island which divided the two

Romans enter the city;

ports. *Æmilianus* himself made a false attack on the citadel, in order to draw the enemy thither. This stratagem had the desired effect; for the citadel being a place of the greatest importance, most of the Carthaginians hastened thither, and made their utmost efforts to repulse their aggressors. But in the mean time *Lælius* having, with incredible expedition, built a wooden bridge over the channel which divided *Cotho* from the isthmus, entered the island, scaled the walls of the fortrefs which the Carthaginians had built there, and made himself master of that important post. The proconsul, who was engaged before *Byrsa*, no sooner understood, by the loud shouts of the troops of *Lælius*, that he had made himself master of *Cotho*, than he abandoned the false attack, and unexpectedly fell on the neighbouring gate of the city, which he broke down, notwithstanding the showers of darts that were incessantly discharged upon his men from the ramparts. As night coming on prevented him from proceeding farther, he made a lodgment within the gate, and waited there for the return of day, with a design to advance through the city to the citadel, and attack it on that side which was but indifferently fortified. Pursuant to this design, at day-break he ordered 4000 fresh troops to be sent from his camp, and, having solemnly devoted to the infernal gods the unhappy Carthaginians, he began to advance at the head of his men, through the streets of the city, in order to attack the citadel. Having advanced to the market-place, he found that the way to the citadel lay through three exceeding steep streets. The houses on both sides were very high, and filled with Carthaginians, who overwhelmed the Romans as they advanced, with darts and stones; so that they could not proceed till they had cleared them. To this end *Æmilianus* in person, at the head of a detachment, attacked the first house, and made himself master of it sword in hand. His example was followed by the officers and soldiers, who went on from house to house, putting all they met with to the sword. As fast as the houses were cleared on both sides, the Romans advanced in order of battle towards the citadel; but with a vigorous resistance from the Carthaginians, who on this occasion behaved with uncommon resolution. From the market-place to the citadel, two bodies of men fought their way every step one above, on the roofs of the houses, the other below in the streets. The slaughter was inexpreffibly great and dreadful. The air rung with shrieks and lamentations. Some were cut in pieces, others threw themselves down from the tops of the houses; so that the streets were filled with dead and mangled bodies. But the destruction was yet greater, when the proconsul commanded fire to be set to that quarter of the town which lay next to the citadel. Incredible multitudes, who had escaped the swords of the enemy, perished in the flames, or by the fall of the houses. After the fire, which lasted six days, had demolished a sufficient number of houses, *Æmilianus* ordered the rubbish to be removed, and a large area to be made, where all his troops might have room to act. Then he appeared with his whole army before *Byrsa*; which so terrified the Carthaginians, who had fled thither for refuge, that first of

172
Which is set on fire.

all 25,000 women, and then 30,000 men, came out of the gates in such a condition as moved pity. They threw themselves prostrate before the Roman general, asking no favour but life. This was readily granted, not only to them, but to all that were in *Byrsa*, except the Roman deserters, whose number amounted to 900. *Aidrubal's* wife earnestly intreated her husband to suffer her to join the suppliant, and carry with her to the proconsul her two sons, who were as yet very young; but the barbarian denied her request, and rejected her remonstrances with menaces. The Roman deserters seeing themselves excluded from mercy, resolved to die sword in hand, rather than deliver themselves up to the vengeance of their countrymen. Then *Aidrubal*, finding them all resolved to defend themselves to the last breath, committed to their care his wife and children; after which he, in a most cowardly and mean-spirited manner, came and privately threw himself at the conqueror's feet. The Carthaginians in the citadel no sooner understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of *Byrsa*. They had now no enemy to contend with but the 900 deserters; who, being reduced to despair, retreated into the temple of *Æsculapius*, which was as a second temple within the first. There the proconsul attacked them; and these unhappy wretches, finding there was no way to escape, set fire to the temple. As the flames spread, they retreated from one part of the building to another, till they got to the roof. There *Aidrubal's* wife appeared in her best apparel, and having uttered the most bitter imprecations against her husband, whom she saw standing below with *Æmilianus*, "Base coward, (said she), the mean things thou hast done to save thy life shall not avail thee; thou shalt die this instant, at least in thy two children." Having thus spoken, she stabbed both the infants with a dagger; and while they were yet struggling for life, threw them both from the top of the temple, and then leaped down after them into the flames.

Æmilianus delivered up the city to be plundered, but in the manner prescribed by the Roman military law. The soldiers were allowed to appropriate to themselves all the furniture, utensils, and brass money, they should find in private houses. But all the gold and silver, the statues, pictures, &c. were reserved to be put into the hands of the quætors. On this occasion the cities of *Sicily*, which had been often plundered by the Carthaginian armies, recovered a number of statues, pictures, and other valuable monuments: among the rest, the famous brazen bull, which *Phalaris* had ordered to be cast, and used as the chief instrument of his cruelty, was restored to the inhabitants of *Agrigentum*. As *Æmilianus* was greatly inclined to spare what remained of this stately metropolis, he wrote to the senate on the subject, from whom he received the following orders: 1. The city of Carthage, with *Byrsa*, and *Megalia*, shall be entirely destroyed, and no traces of them left. 2. All the cities that have lent Carthage any assistance shall be dismantled. 3. The territories of those cities which have declared for the Romans, shall be enlarged with lands.

Carthage. lands taken from the enemy. 4. All the lands between Hippò and Carthage shall be divided among the inhabitants of Utica. 5. All the Africans of the Carthaginian state, both men and women, shall pay an annual tribute to the Romans at so much per head. 6. The whole country, which was subject to the Carthaginian state, shall be turned into a Roman province, and be governed by a prætor, in the same manner as Sicily. Lastly, Rome shall send commissioners into Africa, there to settle jointly with the prætorial the state of the new province.—Before Æmilianus destroyed the city, he performed those religious ceremonies which were required on such occasions: he first sacrificed to the gods, and then caused a plough to be drawn round the walls of the city. After this, the towers, ramparts, walls, and all the works which the Carthaginians had raised in the course of many ages, and at a vast expence, were levelled with the ground; and lastly, fire was set to the edifices of this proud metropolis, which consumed them all, not a single house escaping the flames. Though the fire began in all quarters at the same time, and burnt with incredible fury, it continued for 17 days before all the buildings were consumed.

177
And utterly
destroyed.

Thus fell Carthage, about 146 years before the birth of Christ; a city whose destruction ought to be attributed more to the intrigues of an abandoned faction, composed of the most profligate part of its citizens, than to the power of its rival. The treasure Æmilianus carried off, even after the city had been delivered up to be plundered by the soldiers, was immense, Pliny making it to amount to 4,470,000 pounds weight of silver. The Romans ordered Carthage never to be inhabited again, denouncing dreadful imprecations against those, who, contrary to this prohibition, should attempt to rebuild any part of it, especially Byrra and Megalia. Notwithstanding this, however, about 24 years after, C. Græchus, tribune of the people, in order to ingratiate himself with them, undertook to rebuild it; and, to that end, conducted thither a colony of 6000 Roman citizens. The workmen, according to Plutarch, were terrified by many unlucky omens at the time they were tracing the limits and laying the foundations of the new city; which the senate being informed of, would have suspended the attempt. But the tribune, little affected with such presages, continued to carry on the work, and finished it in a few days. From hence it is probable that only a slight kind of huts were erected; but, whether Græchus executed his design, or the work was entirely discontinued, it is certain, that Carthage was the first Roman colony ever sent out of Italy. According to some authors, Carthage was rebuilt by Julius Cæsar; and Strabo, who flourished in the reign of Tiberius, affirms it in his time to have been equal if not superior to any other city in Africa. It was looked upon as the capital of Africa for several centuries after the commencement of the Christian era. Maxentius laid it in ashes about the sixth or seventh year of Constantine's reign. Genferic, king of the Vandals, took it A.D. 439; but about a century afterwards, it was re-annexed to the Roman empire by the renowned Belisarius. At last the Saracens, under Mohammed's successors, towards the

178
Rebuilt.

179
Utterly destroyed by the Saracens.

close of the seventh century, so completely destroyed it, that there are now scarce any traces remaining.

At the commencement of the third Punic war, Carthage appears to have been one of the first cities in the world.—It was seated on a peninsula 360 It's ancient grandeur. 185
Italia or 45 miles in circumference, joined to the continent by an isthmus 23 Italia or three miles and a furlong in breadth. On the west side there projected from it a long tract of land half a stadium broad; which shooting out into the sea, separated it from a lake or morals, was strongly fortified on all sides by rocks, and a single wall. In the middle of the city stood the citadel of Byrra, having on the top of it a temple sacred to Æsculapius, seated upon rocks on a very high hill, to which the ascent was by 60 steps. On the fourth side the city was surrounded by a triple wall, 30 cubits high; flanked all round by parapets and towers, placed at equal distances of 480 feet. Every tower had its foundation sunk 32 feet deep, and was four stories high, though the walls were but two; they were arched; and, in the lower part, corresponding in depth with the foundations above-mentioned, were stalls large enough to hold 300 elephants with their fodder, &c. Over these were stalls and other conveniences for 4000 horses; and there was likewise room for lodging 20,000 foot, and 4000 cavalry, without in the least incommoding the inhabitants. There were two harbours, so disposed as to have a communication with one another. They had one common entrance 70 feet broad, and shut up with chains. The first was appropriated to the merchants; and included in it a vast number of places of refreshment, and all kinds of accommodations for seamen. The second, as well as the island of Cothon, in the midst of it, was lined with large keys, in which were distinct receptacles for securing and sheltering from the weather 220 ships of war. Over these were magazines of all sorts of naval stores. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and island represented on each side two magnificent galleries. Near this island was a temple of Apollo, in which was a statue of the god all of massy gold; and the inside of the temple all lined with plates of the same metal, weighing 1000 talents. The city was 23 miles in circumference, and at the time we speak of contained 700,000 inhabitants. Of their power we may have some idea, by the quantity of arms they delivered up to the Roman consuls. The whole army was astonished at the long train of carts loaded with them, which were thought sufficient to have armed all Africa. At least it is certain, that on this occasion were put into the hands of the Romans, 2000 catapultæ, 200,000 complete suits of armour, with an innumerable quantity of swords, darts, javelins, arrows, and beams armed with iron which were thrown from the ramparts by the ballistæ.

The character transmitted of the Carthaginians is extremely bad; but we have it only on the authority of the Romans, who being their implacable enemies, cannot be much relied upon. As to their religion, manners, &c. being much the same with the Phœnicians of which they were a colony, the reader is referred for an account of these things to the article PHœNICIA.

New.

New-Carthage
↓
Carthage.

NEW-CARTHAGE, a considerable town of Mexico, in the province of Costarica. It is a very rich trading place. W. Long. 86. 7. N. Lat. 9. 5.

CARTHAGENA, a province of South America, and one of the most considerable in New Castile, on account of the great trade carried on by the capital; for the country itself is neither fertile, rich, nor populous. The capital city, called likewise *Carthage*, is situated in W. Long. 77. N. Lat. 11, on a sandy island, by most writers called a peninsula; which, forming a narrow passage on the south-west, opens a communication with that called *Tierra Bomba*, as far as *Bocca Chica*. The little island which now joins them, was formerly the entrance of the bay; but it having been filled up by orders of the court, *Bocca Chica* became the only entrance: this, however, has been filled up since the attempt of Vernon and Wentworth, and the old passage again opened. On the north side the land is so narrow, that, before the wall was begun, the distance from sea to sea was only 35 toises; but afterwards enlarging, it forms another island on this side; so that, excepting these two places, the whole city is entirely surrounded by salt water. To the eastward it has a communication, by means of a wooden bridge, with a large suburb called *Xemani*, built on another island, which is also joined to the continent by a bridge of the same materials. The fortifications both of the city and suburbs, are built after the modern manner, and lined with free-stone; and, in time of peace, the garrison consists of ten companies of 77 men each, besides militia. The city and inburs are well laid out, the streets straight, broad, uniform, and well paved. All the houses are built of stone or brick, only one story high, well contrived, neat, and furnished, with balconies and lattices of wood, which is more durable in that climate than iron, the latter being soon corroded by the acrimonious quality of the atmosphere. The climate is exceedingly unhealthy. The Europeans are particularly subject to the terrible disease called the *black vomit*, which sweeps off multitudes annually on the arrival of the galleons. It seldom continues above three or four days; in which time the patient is either dead, or out of danger, and if he recovers is never subject to a return of the same distemper.—This disease has hitherto foiled all the art of the Spanish physicians; as has also the leprosy, which is very common here. At *Carthage*, likewise, that painful tumour in the legs, occasioned by the entrance of the *Dracunculus* or Guinea-worm, is very common and troublesome. Another disorder peculiar to this country and to Peru, is occasioned by a little insect called *Nigua*, so extremely minute, as scarce to be visible to the naked eye. This insect breeds in the dust, insinuates itself into the soles of the feet and the legs, piercing the skin with such subtilty, that there is no being aware of it, before it has made its way to the flesh. If it is perceived in the beginning, it is extracted with little pain; but having once lodged its head, and pierced the skin, the patient must undergo the pain of an incision, without which a nodule would be formed, and a multitude of insects ingendered, which would soon overpread the foot and leg. One species of the *nigua* is venomous; and when it enters the toe, an inflammatory swelling,

greatly resembling a venercal bubo, takes place in the groin.

Carthage
↓
Carthamus.

CARTHAGENA, a sea-port town of Spain in the kingdom of Murcia, and capital of a territory of the same name; built by Asdrubal, a Carthaginian general, and named after Carthage. It has the best harbour in all Spain, but nothing else very considerable; the bishop's see being transferred to Toledo. In 1706 it was taken by Sir John Leak; but the Duke of Berwick retook it afterwards. W. Long. o. 58. N. Lat. 37. 36.

CARTHAMUS, *BASTARD-SAFFRON*, or *Safflower*, a genus of the polygamia æqualis order belonging to the syngenesia class of plants. Of this genus there are nine species; but the only remarkable one is the tinctorius, with a saffron-coloured flower. This is a native of Egypt and some of the warm parts of Asia. It is at present cultivated in many parts of Europe, and also in the Levant, from whence great quantities of it are annually imported into Britain for the purposes of dyeing and painting. It is an annual plant; and rises with a stiff ligneous stalk, about two feet and a half or three feet in height, dividing upwards into many branches, garnished with oval pointed leaves sitting close to the branches. The flowers grow single at the extremity of each branch; the heads of the flowers are large, inclosed in a scaly empalement; each scale is broad at the base, flat, and formed like a leaf of the plant, terminating in a sharp spine. The lower part of the empalement spreads open; but the scales above closely embrace the florets, which are of a fine saffron colour, and are the part used for the purposes above-mentioned. The good quality of this commodity is in the colour, which is of a bright saffron hue; and in this the British *carthamus* very often fails; for if there happens much rain during the time the plants are in flower, the flowers change to a dark or dirty yellow, as they likewise do if the flowers are gathered with any moisture remaining upon them.—The plants are propagated by seeds, which should be sown in drills, at two feet and a half distance from one another, in which the seeds should be scattered singly. The plants will appear in less than a month; and in three weeks or a month after, it will be proper to hoe the ground; at which time the plants should be left six inches distant: after this they will require a second hoeing; when they must be thinned to the distance at which they are to remain. If after this they are hoed a third time, they will require no farther care till they come to flower; when, if the safflower is intended for use, the florets should be cut off from the flowers as they come to perfection; but this must be performed when they are perfectly dry; and then they should be dried in a kiln with a moderate fire, in the same manner as the true saffron. But in those flowers which are propagated for seeds, the florets must not be cut off, or the seeds will prove abortive.—The seeds of *carthamus* have been celebrated as a cathartic; but they operate very slowly, and for the most part disorder the stomach and bowels, especially when given in substance: triturated with distilled aromatic waters, they form an emulsion less offensive, yet inferior in efficacy to the more common purgatives. They are eaten

Carthusians
|
Carton.

eaten by a species of Egyptian parrot, which is very fond of them; to other birds or beasts they would prove a mortal poison.

CARTHUSIANS, a religious order founded in the year 1080, by one Brindo. The Carthusians, so called from the desert of *Chartreux*, the place of their institution, are remarkable for the austerity of their rule. They are not to go out of their cells, except to church, without leave of their superior; nor speak to any person without leave. They must not keep any portion of their meat or drink till next day; their beds are of straw, covered with a felt; their clothing two hair-cloaths, two cowls, two pair of hose, and a cloak, all coarse. In the refectory, they are to keep their eyes on the dish, their hands on the table, their attention on the reader, and their hearts fixed on God. Women are not allowed to come into their churches. It is computed that there are 172 houses of Carthusians; whereof five are of *Nuns*, who practise the same austerities as the Monks. They are divided into 16 provinces, each of which has two visitors. There have been several canonized saints of this order, four cardinals, 70 archbishops and bishops, and a great many very learned writers.

CARTHUSIAN-Powder, the fame with kermes-mineral. See *KERMES*.

CARTILAGE, in anatomy, a body approaching to the nature of bones; but lubricous, flexible, and elastic. See *ANATOMY*, n° 3.

CARTILAGINOUS, in ichthyology, a title given to all fish whose muscles are supported by cartilages instead of bones; and comprehends the same genera of fish to which Linnæus has given the name of *amphibia nantes*: but the word *amphibia* ought properly to be confined to such animals as inhabit both elements; and can live, without any inconvenience, for a considerable time, either on land or in water; such as tortoises, frogs, and several species of lizards; and, among the quadrupeds, hippopotami, &c. &c.

Many of the cartilaginous fish are viviparous, being excluded from an egg, which is hatched within them. The egg consists of a white and a yolk; and is lodged in a case formed of a thick tough substance, not unlike softened horn; such are the eggs of the *ray* and *shark* kinds. Some again differ in this respect, and are oviparous; such is the *sturgeon*, and others.

They breathe either through certain apertures beneath, as in the *rays*; on their sides, as in the *sharks*, &c.; or on the top of the head, as in the *pipe-fish*: for they have not covers to their gills like the bony fish.

CARTMEL, a town of Lancashire in England. It is seated among the hills called Carmel-fells, not far from the sea, and near the river Kent; adorned with a very handsome church, built in the form of a cross like a cathedral. The market is well supplied with corn, sheep, and fish. W. Long. 2. 43. N. Lat. 54. 15.

CARTON, or **CARTOON**, in painting, a design drawn on strong paper, to be afterwards calked through, and transferred on the fresh plaster of a wall to be painted in fresco.

CARTON is also used for a design coloured, for working in mosaic, tapestry, &c. The cartons for-

merly at Hampton-court, but now at the queen's palace, are designs of Raphael Urbin, intended for tapestry.

CARTOUCHE, in architecture and sculpture, an ornament representing a scroll of paper. It is usually a flat member, with wavings, to represent some inscription, device, cipher, or ornament of armoury. They are, in architecture, much the same as modillions; only these are set under the cornice in wainscoting, and those under the cornice at the eaves of a house.

CARTOUCHE, in the military art, a case of wood, about three inches thick at the bottom, girt with marlin, holding about four hundred musket-balls, besides six or eight balls of iron, of a pound weight, to be fired out of a hobit, for the defence of a pair, &c.

A cartouche is sometimes made of a globular form, and filled with a ball of a pound weight; and sometimes it is made for the guns, being of a ball of half or quarter a pound weight, according to the nature of the gun, tied in form of a bunch of grapes, on a tomion of wood, and coated over. These were made in the room of partridge-shot.

CARTRIDGE, in the military art, a case of pasteboard or parchment, holding the exact charge of a fire-arm. Those for muskets, carbines, and pistols, hold both the powder and ball for the charge; and those of cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the caliber of the piece.

CARTRIDGE-Box, a case of wood or turned iron, covered with leather, holding a dozen musket-cartridges. It is wore upon a belt, and hangs a little lower than the right pocket-hole.

CARTWRIGHT (William) an eminent divine and poet, born at Northway, near Tewksbury, in Gloucestershire, in September 1611. He finished his education at Oxford; afterwards went into holy orders, and became a most florid preacher in the university. In 1642, he had the place of succentor in the church of Salisbury; and, in 1643, was chosen junior proctor in the university. He was also metaphysical reader there. Wit, judgment, elocution, a graceful person and behaviour, occasioned that encomium of him from dean Fell, "That he was the utmost that man could come to." He was an expert linguist; an excellent orator; and at the same time was esteemed an admirable poet. There are extant of his, four plays, and some poems. He died in 1643, aged 33.

CARVER, a cutter of figures, or other devices, in wood. See *CARVING*.

Carvers answer to what the Romans call *sculptores*, who were different from *calatores* or engravers, as these last wrought in metal.

CARVER is also used for the person who cuts up the meat at table. In the great families at Rome, the carver was an officer of some figure. There were masters to teach the art regularly, by means of figures of animals cut in wood. The Greeks also had their carvers, called *δαρτοι*, *q. d. diribitores*, or distributors. In the primitive times the master of the feast carved for all his guests. Thus, in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero himself carved the meat. Of latter times, the

Cartouche
|
Carver.

Carvi
Caruncula.

the same office, on solemn occasions, was executed by the chief men of Sparta.

CARUI, or CARVI, in botany. See CARUM.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body, by means of some sharp instrument, especially a chisel. In this sense carving includes statuary and engraving, as well as cutting in wood.

CARVING, in a more particular sense, is the art of engraving or cutting figures in wood. In this sense *carving*, according to Pliny, is prior both to statuary and painting.

To carve a figure or design, it must be first drawn or pasted on the wood; which done, the rest of the block, not covered by the lines of the design, are to be cut away with little narrow-pointed knives. The wood fittest for the use is that which is hard, tough, and close, as beech, but especially box: to prepare it for drawing the design on, they wash it over with white-lead tempered in water; which better enables it either to bear ink or the crayon, or even to take the impression by chalking. When the design is to be pasted on the wood, this whitening is omitted, and they content themselves with sealing the wood well planed. Then wiping over the printed side of the figure with gum tragacanth dissolved in water, they clap it smooth on the wood, and let it dry; which done, they wet it slightly over, and fret off the surface of the paper gently, till all the strokes of the figure appear distinctly. This done, they fall to cutting, or carving, as above.

CARUM, CARAWAY; a genus of the digymia order, belonging to the pentandria class of plants.

Species, &c. 1. The caraway of the shops grows naturally in many places of Britain. It is a biennial plant, which rises from seeds one year, flowers the next, and perishes soon after the seeds are ripe. It hath a taper root like a parsnep, but much smaller, which runs deep into the ground, sending out many small fibres, and hath a strong aromatic taste. From the root arises one or two smooth, solid, channelled stalks, about two feet high, garnished with winged leaves, having long naked foot-stalks. 2. The hyspanicum is also a biennial, and is a native of Spain. It rises with a stronger stalk than the former, which seldom grows more than a foot and half high; but is closely garnished with fine narrow leaves like those of dill. Both these plants are propagated by seeds, which ought to be sown in autumn. Sheep, goats, and swine, eat this plant; cows and horses are not fond of it. Parkinson says, the young roots of caraway are better eating than parsneps. The tender leaves may be boiled with pot herbs. The seeds have an aromatic smell, and a warm pungent taste. They are used in cakes, incruised with sugar, as sweet-meats, and distilled with spirituous liquors, for the sake of the flavour they afford. They are in the number of the four greater hot seeds; and frequently employed, as a stomachic and carminative, in flatulent colics and the like. See MATERIA MEDICA, n° 218.

CARUNCULA, or CARUNCLE, in anatomy, a term denoting a little piece of flesh, and applied to several parts of the human body. Thus,

CARUNCULE *Myrtiformes*, in anatomy, fleshy knobs about the size of a myrtle-berry, which owe their origin to the breaking of the hymen. See ANATOMY, n° 372, d.

Carunculae
Cary.

CARUNCLES in the urethra, proceeding from a gonorrhœa, or an ulceration of the urethra, may be reduced by introducing the *BOUGIE*.

CARUS, a sudden deprivation of sense and motion, affecting the whole body. See (the *Index* sub-joined to) MEDICINE.

CARUS (Marcus Aurelius), was raised from a low station, by his great merit, to be emperor of Rome in 282. He shewed himself worthy of the empire; subdued its enemies; and gave the Romans a prospect of happy days, when he was unfortunately killed by lightning in 284.

CARWAR, a town of Asia, on the coast of Malabar in the East Indies, and where the East India company have a factory, fortified with two bastions. The valleys about it abound in corn and pepper, which last is the best in the East Indies. The woods on the mountains abound with quadrupeds, such as tigers, wolves, monkeys, wild hogs, deer, elks, and a sort of beeves of a prodigious size. The religion of the natives is Paganism; and they have a great many strange and superstitious customs. E. Long. 73. 7. N. Lat. 15. 0.

CARYATES, in antiquity, a festival in honour of Diana named *Caryatis*, held at Caryum, a city of Laconia. The chief ceremony was a certain dance said to have been invented by Castor and Pollux, and performed by the virgins of the place. During Xerxes's invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the goddess's anger by such an intermission, the neighbouring swains are said to have assembled and sung pastorals or *buccolini*, which is said to have been the origin of *bucolic* poetry.

CARY (Lucius), Lord viscount Falkland, was born in Oxfordshire, about the year 1610; a young nobleman of great abilities and accomplishments. About the time of his father's death in 1633, he was made gentleman of the privy chamber to king Charles I. and afterward secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and every pleasure which a fine genius, a generous disposition, and an opulent fortune, could afford: when called into public life, he stood foremost in all attacks on the high prerogatives of the crown; but when civil convulsions came to an extremity, and it was necessary to chuse a side, he tempered his zeal, and defended the limited powers that remained to monarchy. Still anxious however for his country, he seems to have dreaded equally the prosperity of the royal party, or that of the parliament; and, among his intimate friends, often sadly reiterated the word *peace*. This excellent nobleman freely exposed his person for the king in all hazardous enterprises, and was killed in the 34th year of his age at the battle of Newbery. He wrote several things, both poetical and political; and in some of the king's declarations, supposed to be penned by lord Falkland, we find the first regular definition of the English constitution that occurs in any composition published by authority.

CARY

Cary
I
Caryophyl-
lus.

CARY (Robert), a learned English chronologer, born in Devonshire about the year 1615. On the reformation, he was preferred to the archdeaconry of Exeter; but on some pretext was ejected in 1664, and spent the rest of his days at his rectory of Portle-mouth, where he died in 1688. He published *Pala-logia Chronica*, a chronology of ancient times, in three parts, didactical, apodeictical, and canonical; and translated the hymns of the church into Latin verse.

CARYATIDES, or CARAITES. See ARCHITECTURE, n° 61.

CARYL (Joseph), a divine of the last century, bred at Oxford, and some time preacher to the society of Lincoln's inn, an employment he filled with much applause. He became a frequent preacher before the long parliament, a licenser of their books, one of the assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he shewed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the reformation of Charles II. he was silenced by the act of uniformity, and lived privately in London, where, beside other works, he distinguished himself by a laborious *Exposition of the Book of Job*; and died in 1672.

CARYOPHYLLEI, in botany, the name of a very numerous family, or order, in Linnæus's fragments of a natural method: containing, besides the class of the same name in Tournefort, many other plants, which from their general appearance seem pretty nearly allied to it. The following are the genera, *viz.* Agrostema, Cucubalus, Dianthus, Drypis, Gypsophila, Lychnis, Saponaria, Silene, Velazia, Afline, Arenaria, Bufonia, Cerastium, Cherleria, Glinus, Holosteum, Loefflingia, Moehringia, Polycarpon, Sagina, Spargula, Stellaria, Minuartia, Mollugo, Ortegia, Pharnaceum, Queria. To this order, some have also annexed, though somewhat improperly, the Polypremum and Scleranthus. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds do not rise an inch, and the tallest exceed not seven or eight feet. See BOTANY, sect. vi. 22.

CARYOPHYLLUS, the PINK, in botany. See DI-ANTHUS.

CARYOPHYLLUS, the CLOVE-TREE, a genus of the monogynia order, belonging to the polyandria class of plants. Of this there is but one species, *viz.* the aromaticus, which is a native of the Molucca islands, particularly of Amboyna, where it is principally cultivated. The clove-tree resembles, in its bark, the olive; and is about the height of the laurel, which it also resembles in its leaves. No verdure is ever seen under it. It has a great number of branches, at the extremities of which are produced vast quantities of flowers, that are first white, then green, and at last pretty red and hard. When they arrive at this degree of maturity, they are, properly speaking, *cloves*. As they dry, they assume a dark yellowish cast; and, when gathered, become of a deep brown. The season for gathering the cloves is from October to February. The boughs of the trees are then strongly shaken, or the cloves beat down with long reeds. Large cloths are spread to receive them, and they are

afterwards either dried in the sun, or in the smoke of Caryophyllus the bamboo-cane. The cloves which escape the notice of those who gather them, or are purposely left upon the tree, continue to grow till they are about an inch in thickness; and these falling off, produce new plants, which do not bear in less than eight or nine years. These, which are called *mother-cloves*, are inferior to the common sort; but are preferred in sugar by the Dutch; and, in long voyages, eat after their meals, to promote digestion.

The clove, to be in perfection, must be full sized, heavy, oily, and easily broken; of a fine smell, and of a hot aromatic taste, so as almost to burn the throat. It should make the fingers smart when handled, and leave an oily moisture upon them when pressed. In the East Indies, and in some parts of Europe, it is so much admired as to be thought an indispensable ingredient in almost every dish. It is put into their food, liquors, wines, and enters likewise the composition of their perfumes. Considered as medicines, cloves are very hot, stimulating, aromatics; and possess in an eminent degree the general virtues of substances of this class*. Their pungency resides in their resin; or rather in a combination of resin with essential oil†: for the spirituous extract is very pungent; but if the oil and the resin contained in this extract are separated from each other by distillation, the oil will be very mild; and any pungency which it does retain, proceeds from some small portion of adhering resin, and the remaining resin will be insipid. No plant, or part of any plant, contains such a quantity of oil as cloves do. From 16 ounces Newinan obtained by distillation two ounces and two drams, and Hoffman obtained an ounce and an half of oil from two ounces of the spice. The oil is specifically heavier than water. Cloves acquire weight by imbibing water; and this they will do at some considerable distance. The Dutch, who trade in cloves, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of cloves is ordered, they hang it, for several hours before it is sent in, over a vessel of water, at about two feet distance from the surface. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is sometimes practised in Europe, as well as in the spice islands: but the degree of moisture must be more carefully watched in the latter; for there a bag of cloves will, in one night's time, attract so much water, that it may be pressed out of them by squeezing them with the hand.

The clove-tree is never cultivated in Europe. At Amboyna the company have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually on an average more than two pounds of cloves; and consequently the collective produce must weigh more than a million. The cultivator is paid with the specie that is constantly returned to the company, and receives some unbleached cottons which are brought from Comorandel.

CASAL, a strong town of Italy in Mounterrat, with a citadel and a bishop's see. It was taken by

lus
I
Casal.

* See *Matéria Medica*, n° 49.

† See *Pour-moy*, n° 320.

Cafal
Cafati.

the French from the Spaniards in 1640; and the duke of Mantua sold it to the French in 1681. In 1695 it was taken by the allies, who demolished the fortifications; but the French retook it, and fortified it again. The king of Sardinia became master of it in 1706, from whom the French took it in 1745; however, the king of Sardinia got possession again in 1746. It is seated on the river Po, in E. Long. 8. 37. N. Lat. 54. 7.

CASAL-Maggiore, a small strong town of Italy, in the duchy of Milan, seated on the river Po. E. Long. 11. 5. N. Lat. 45. 6.

CASA-NOVA (Marc Antony), a Latin poet, born at Rome, succeeded particularly in epigrams. The poems he composed in honour of the illustrious men of Rome are also much esteemed. He died in 1527.

CASAN, a considerable town of Asia, and capital of a kingdom of the same name in the Russian empire, with a strong castle, a citadel, and an archbishop's see. The country about it is very fertile in all sorts of fruits, corn, and pulse. It carries on a great trade in furs, and furnishes wood for the building of ships. The kingdom of Casan is bounded on the north by Permian, on the east by Siberia, on the south by the river Wolga, and on the west by the province of Mowcow. E. Long. 53. 25. N. Lat. 55. 38.

CASAS (Bartholomew de las) bishop of Chiapa, distinguished for his humanity and zeal for the conversion of the Indians, was born at Seville in 1474; and went with his father, who failed to America with Christopher Columbus in 1493. At his return to Spain he embraced the state of an ecclesiastic, and obtained a curacy in the island of Cuba; but some time after quitted his cure in order to procure liberty for the Indians, whom he saw treated by the Spaniards in the most cruel and barbarous manner, which naturally gave them an unconquerable aversion to Christianity. Bartholomew exerted himself with extraordinary zeal, for 50 years together, in his endeavours to persuade the Spaniards that they ought to treat the Indians with equity and mildness; for which he suffered a number of persecutions from his countrymen. At last the court, moved by his continual remonstrances, made laws in favour of the Indians, and gave orders to the governors to observe them, and see them executed*. He died at Madrid in 1566, aged 92. He wrote several works, which breathe nothing but humanity and virtue. The principal of them are, 1. An account of the destruction of the Indians. 2. Several treatises in favour of the Indians, against Dr Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards. 3. A very curious, and now scarce, work in Latin, on this question, "Whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects and place them under the dominion of another sovereign?"

CASATI (Paul), a learned Jesuit, born at Placentia in 1617, entered early among the Jesuits; and, after having taught mathematics and divinity at Rome, was sent into Sweden to queen Christina, whom he prevailed on to embrace the popish religion. He wrote, 1. *Vacuum proscriptum*. 2. *Terra machinis mota*.

3. *Machanicorum, libri octo*. 4. *De Igne Dissertationes*; which is much esteemed. 5. *De Angelis Disputatio Theolog.* 6. *Hydrostatica Dissertationes*. 7. *Opticae Disputationes*. It is remarkable that he wrote this treatise on optics at 88 years of age, and after he was blind. He also wrote several books in Italian.

CASAUON (Ifaac), was born at Geneva in 1559; and Henry IV. appointed him his library keeper in 1603. After this prince's death, he went into England with Sir Henry Wotton, ambassador from King James I. where he was kindly received, and engaged in writing against Baronius's annals: he died not long after this, in 1614; and was interred in Westminster-abbey, where a monument was erected to him. He was greatly skilled in the Greek, and in criticism; published several valuable commentaries; and received the highest eulogiums from all his contemporaries.

CASAUON (Meric), son of the preceding, was born at Geneva in 1599. He was bred at Oxford, and took the degree of master of arts in 1621. The same year he published a book in defence of his father against the calumnies of certain Roman-catholics; which gained him the favour of King James I. and a considerable reputation abroad. He was made prebendary of Canterbury by archbishop Laud. In the beginning of the civil war he lost all his spiritual promotions, but still continued to publish excellent works. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed his pen in writing the history of the late war; but he declined it, owning, that his subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered three or four hundred pounds to be paid him by a bookseller in London whose name was Cromwell, on demand, without requiring from him any acknowledgement of his benefactor. But this offer he rejected, though his circumstances were then mean. At the same time it was proposed by his friend Mr Greaves, who belonged to the library at St James's, that, if Casaubon would gratify Cromwell in the request above-mentioned, all his father's books which were then in the royal library, having been purchased by King James, should be restored to him, and a pension of 300*l.* a-year paid to the family as long as the youngest son of Dr Casaubon should live; but this also was refused. He likewise refused handsome offers from Christina queen of Sweden, being determined to spend the remainder of his life in England. At the restoration he recovered all his preferments, and continued writing to his death in 1671. He was the author of an English translation of Marcus Aurelius Antoninus's meditations, and of Lucius Florus; editions of several of the classics, with notes; a treatise of use and custom; a treatise of enthusiasm; with many other works; and he left a number of MSS. to the university of Oxford.

CASCADE, a steep fall of water from a higher into a lower place.

They are either natural, as that at Tivoli, &c. or artificial, as those of Versailles, &c. and either falling with gentle descent, as those of Sceaux; or in form of a buffet, as at Trianon; or down steep

Casaubon
Cafcade.

* See the
article
Mexico.

form of a perron, as at St Clou; or from baſon to baſon, &c.

CASCAIS, a town of Eſtremadura in Portugal, ſituated at the mouth of the river Tagus, 17 miles eaſt of Liſbon. W. Long. 10. 15. N. Lat. 38. 40.

CASE, among grammarians, implies the different inflections or terminations of nouns, ſerving to expreſs the different relations they bear to each other, and to the things they repreſent. See **GRAMMAR**, n^o 17.

CASE alſo denotes a receptacle for various articles; as a caſe of knives, of lancets, of piſtols, &c.

CASE, in printing, a large flat oblong frame placed aſlope, divided into ſeveral compartments, or little ſquare cells; in each of which are lodged a number of types, or letters, of the ſame kind, whence the compoſitor takes them out, each as he needs it, to compoſe his matter. See **PRINTING**.

CASE is alſo uſed for a certain numerous quantity of divers things. Thus a caſe of crown-glaſs contains uſually 24 tables, each table being nearly circular, and about three feet fix inches diameter; of New-caſtle glaſs, 35 tables; of Normandy glaſs, 25.

CASE-HARDENING of Iron, is a ſuperficial converſion of that metal into ſteel, by the ordinary method of converſion, namely by cementation with vegetable or animal coals. This operation is generally practiſed upon ſmall pieces of iron wrought into tools and inſtruments to which a ſuperficial converſion is ſufficient; and it may be performed conveniently by putting the pieces of iron to be caſe-hardened, together with the cement, in an iron box, which is to be cloſely ſhut and expoſed to a red heat during ſome hours. By this cementation a certain thickneſs from the ſurface of the iron will be converted into ſteel, and a proper hardneſs may be afterwards given by ſudden extinction of the heated pieces of converted iron in a cold fluid. See **STEEL**.

CASE-SHOT, in the military art, muſket-balls, ſtones, old iron, &c. put into caſes, and ſhot out of great guns.

CASEMENT, or **CASEMATE**, in architecture, a hollow moulding, which ſome architects make one-fixth of a circle, and others one-fourth.

CASEMENT is alſo uſed in building, for a little moveable window, uſually within a larger, being made to open or turn on hinges.

CASERN, in fortification, lodgings built in garriſon-towns, generally near the rampart, or in the waſte places of the town, for lodging ſoldiers of the garriſon. There are uſually two beds in each caſern for fix ſoldiers to lie, who mount the guard alternately; the third part being always on duty.

CASERTA, an epifcopal town of Italy in the kingdom of Naples, and in the Terra-di-Lavoro, with the title of a duchy, ſeated at the foot of a mountain of the ſame name, in E. Long. 15. 5. N. Lat. 41. 5.

CASES (Peter-James), of Paris, the moſt eminent painter of the French ſchool; the churches of Paris and of Verſailles abound with his works. He died in 1754, aged 79.

CASH, in a commercial ſtyle, ſignifies the ſtock of money which a merchant, trader, or banker, has at his diſpoſal in order to trade.

CASH-Book. See **BOOK-KEEPING**. p. 1269.

CASHEL, or **CASHIL**, a town of Ireland in the county of Tipperary, and province of Munſter, with an archbiſhop's ſee. W. Long. 7. 36. N. Lat. 52. 16.

CASHEW-NUT: See **ANACARDIUM**. This nut grows on the end of the fruit of the Anacardium tree, and is quite bare, of the exact figure of a hare's or ſheep's kidney; it is about an inch long, containing within it a large white kernel of a fine taſte, which is roaſted and eaten. The fruit is generally of a yellow colour, as large as an orange; is very ſtringy; and full of rough, aſtringent, but pleaſant juice, which in America is frequently uſed, like that of lemons with us, in making punch. The outer ſhell of the nut is of an aſh colour, and very ſmooth; under this outer rind, is another which covers the kernel; between them is a thick black inflammable oil which is very cauſtic. When the Weſt India young ladies fancy themſelves too much tanned by the ſcorching rays of the ſun, they gently ſcrape off the thin outside of the ſtone, and then rub their faces all over with the ſtone. Their faces immediately ſwell and grow black; and the ſkin being poiſoned by the cauſtic oil above mentioned, will, in the ſpace of five or fix days, come entirely off in large flakes, ſo that they cannot appear in public in leſs than a fortnight; by which time the new ſkin looks as fair as that of a new-born child. The negroes in Brazil cure themſelves effectually of diſorders in the ſtomach, by eating of the yellow fruit of this tree, the juice of which, being acid, cuts the thick tough humours which obſtructed the free circulation of the blood, and thus removes the complaint. This cure, however, is not voluntary; for their maſters, the Portugueſe, deny them any other ſuſtenance; and, letting them looſe to the woods, where the caſhew-nuts grow in great abundance, leave it in their option to periſh by famine, or ſuſtain themſelves with this fruit.

CASIMIR, the name of ſeveral kings of Poland. See (*Hiſtory of*) **POLAND**.

CASIMIR (Matthias Sorbiewſki), a Polifh Jeſuit, born in 1597. He was a moſt excellent poet; and is, ſays M. Baillet, an exception to the general rule of Ariſtotele and the other ancients, which teaches us to expect nothing ingenious and delicate from northern climates. His odes, epodes, and epigrams, have been thought not inferior to thoſe of the fineſt wits of Greece and Rome. Dr Watts has tranſlated one or two of his ſmall pieces, which are added to his Lyric Poems. He died at Warſaw in 1640, aged 43. There have been many editions of his poems, the beſt of which is that of Paris 1759.

CASING of TIMBER-WORK, among builders, is the plaſtering the houſe all over the outſide with mortar, and then ſtriking it while wet by a ruler, with the corner of a trowel, to make it reſemble the joints of free-ſtone. Some direct it to be done upon heart-laths, becauſe the mortar would, in a little time, decay the ſap-laths; and to lay on the mortar in two thickneſſes, viz. a ſecond before the firſt is dry.

CASK, a piece of defensive armour wherewith to cover the head and neck; otherwiſe called the *head-piece and helmet* *. The word is French, *caſque*, from *caſicum* or *caſſicus*, a diminutive of *caſſis* a helmet, *met.* Le Gendre obſerves, that anciently, in France, the

Cask
|
Cassandra.

gens d'arms all wore *casks*. The king wore a *cask* gilt; the dukes and counts silvered; gentlemen of extraction polished steel; and the rest plain iron.

The *cask* is frequently seen on ancient medals, where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all the coverings of the head, as well as the most universal. Kings, emperors, and even gods themselves are seen therewith. That which covers the head of Rome, has usually two wings like those of Mercury: and that of some kings is furnished with horns like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express uncommon force.

CASK, in heraldry, the same with helmet. See *HERALDRY*, n° 45.

CASK, a vessel of capacity, for preserving liquors of divers kinds; and sometimes also dry goods, as sugar, almonds, &c.—A *cask* of sugar is a barrel of that commodity, containing from eight to eleven hundred weight.

CASKET, in a general sense, a little coffer, or cabinet. See *CABINET*.

CASKETS, in the sea-language, are small ropes made of finnet, and fastened to gromets, or little rings upon the yards; their use is to make fast the sail to the yard when it is to be furled.

CASPIAN SEA, a large lake of salt water in Asia, bounded by the province of Astracan on the north, and by part of Persia on the south, east, and west. It is upwards of 400 miles long from south to north, and 300 broad from east to west.

CASSANDER, king of Macedon after Alexander the Great, was the son of Antipater. He made several conquests in Greece, abolished democracy at Athens, and gave the government of that state to the orator Demetrius. Olympias, the mother of Alexander, having caused Aridæus and his wife Eurydice, with others of Cassander's party, to be put to death; he besieged Pydne, whither the queen had retired, took it by a stratagem, and caused her to be put to death. He married Thessalonica the sister of Alexander the Great; and killed Roxana and Alexander, the wife and son of that conqueror. At length he entered into an alliance with Seleucus and Lyfimachus, against Antigonus and Demetrius; over whom he obtained a great victory near Ipsus in Phrygia, 301 years before the Christian æra, and died three years after in the 19th year of his reign.

CASSANDRA, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy, provided she would consent to his love. Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the tempter, and broke her word. Apollo, being enraged, revenged himself by causing no credit to be given to her predictions; hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agamemnon, who loved her to distraction; but in vain did she predict that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but

their death was avenged by Orestes.

CASSANO, a town of Italy in the duchy of Milan, rendered remarkable by an obstinate battle fought there between the Germans and French in 1705. It is subject to the House of Austria, and is seated on the river Adda, in E. Long. 10. 0. N. Lat. 45. 20.

CASSANO, a town of Italy in Calabria citerior, in the kingdom of Naples, with a bishop's see. E. Long. 16. 30. N. Lat. 39. 55.

CASSAVI, or *CASSADA*. See *JATROPHA*.

CASSEL, a town of French Flanders, and capital of a chatellany of the same name: It is seated on a mountain, where the terrace of the castle is still to be seen; and from whence there is one of the finest prospects in the world; for one may see no less than 32 towns, with a great extent of the sea, from whence it is distant 15 miles. E. Long. 2. 27. N. Lat. 50. 48.

CASSEL, the capital city of the landgraviate of Hesse-cassel, in the circle of the Upper Rhine in Germany, is divided into the Old, New, and High Towns. The New Town is best built, the houses being of stone, and the streets broad. The houses of the Old Town, which is within the walls, are mostly of timber; but the streets are broad, and the market-places spacious. The place is strongly fortified, but the fortifications are not regular. The inhabitants are mostly French protestants, and carry on a woollen manufactory. It is seated on the declivity of a hill near the river Fulva, in E. Long. 9. 20. N. Lat. 51. 20.

CASSIA, *WILD SENNA*; a genus of the monogynia order, belonging to the decandria class of plants. There are 30 species, all of them natives of warm climates. The most remarkable is the fistula, or purging cassia of Alexandria. It is a native of Egypt and both Indies, where it rises to the height of 40 or 50 feet, with a large trunk, dividing into many branches, garnished with winged leaves, composed of five pair of spear-shaped lobes, which are smooth, having many transverse nerves from the midrib to the border. The flowers are produced in long spikes at the end of the branches, each standing upon a pretty long foot-stalk; these are composed, like the former, of five yellow concave petals, which are succeeded by cylindrical pods from one to two feet long, with a dark brown woody shell, having a longitudinal seam on one side, divided into many cells by transverse partitions, each containing one or two oval, smooth, compressed seeds, lodged in a blackish pulp, which is used in medicine. Among the species of cassia, Linnaeus mentions the common *SENNA* of the shops; which see. With regard to the culture of all the species, they are propagated by seeds which must be sown upon a hot-bed, and the plants treated in the same manner with other tender exotics. The fistula must have very little water in winter; for the plants grow naturally in dry sandy ground, and moisture is a great enemy to them.

The pulp of the cassia fistula is a gentle laxative, and frequently given in costive habits, in the dose of some drams. Geoffroy says it does excellent service in the painful tension of the belly which sometimes follows the imprudent use of antimonials; and that it may be advantageously acuated by the more acrid purgatives,

Cassano
|
Cassia.

Cassia
Cassimire.

purgatives, or antimonial emetics, or employed to abate their force. Vallinier relates, that the purgative virtue of this medicine is remarkably promoted by manna; that a mixture of four drams of cassia, and two of manna, purges as much as 12 drams of cassia alone, or 32 of manna alone. Sennertus observes, that the urine is apt to be turned of a green colour, by the use of cassia; and sometimes, where a large quantity has been taken, blackish. See MATERIA MEDICA, n° 223.

CASSIA-LIGNEA. See CINNAMOMUM.

CASSIDA, in botany. See SCUTELLARIA.

CASSIDA, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are like threads, but thicker on the outside; the clytra are marginated; and the head is hid under the thorax. There are 31 species of this insect, distinguished principally by differences in their colour.

CASSIMIRE, or CASHMIRE, a province of the Mogul's dominions, in Asia, supposed to have been formerly a lake. It is seated at the extremity of Indostan, to the north of Lahor; and is surrounded by the mountains of Caucasus, between Great Thibet, Little Thibet, Bukharia, Cabellstan, and Lahor. The mountains that are nearest the plain are of a moderate height; are covered with trees or pasture land; and are full of cattle of several sorts, as cows, sheep, goats, and horses, as well as the milk-goat. There are likewise various kinds of game, as partridges, hares, gazels, &c. Beyond these mountains there are others, which rise very high, and have their tops always covered with snow. From these mountains there rises a great number of springs and rivulets, which the inhabitants conduct to their rice-fields. All these streams unite into one large enough to carry boats, which, after several turnings and windings, runs through the middle of the capital city. This province, or kingdom, is about 90 miles in length, and 30 in breadth; and is full of towns and villages. These are intermixed with canals, small lakes, and rivulets. There are here all sorts of European trees and plants, such as apple, pear, plum, apricot, &c.

The capital city, which has the same name as the kingdom, is about two miles in length, and one and a half in breadth. It is seated in a flat country, six miles from the mountains; and on the banks of a lake of fresh water, which is about twelve miles in compass. The river has two wooden bridges built over it, to maintain a communication between both parts of the city. The houses are generally of wood, and well built; and there is a great number of idol temples, which were are all of free-stone, but now in ruins. The houses near the river have their gardens next the water, which make a very fine appearance, especially in summer.

The lake is full of islands, on which they have made pleasure gardens, and planted fruit-trees. These are generally surrounded with tall palms. The inhabitants are very ingenious and industrious, making palankins, and all sorts of cabinets and boxes, in a very curious manner, which are dispersed all over the Indies. They also make a vast number of shauls, which are pieces of stuff about an ell and a half long,

and one broad, curiously embroidered. They are extremely fine and soft, and sell at a great price. The Indians, both men and women, wear them over their heads in the winter. The people have a clear complexion, and are well made. The women are very handsome; though only the common sort are generally seen abroad or in the shops.

It has been by some suspected, that the ten tribes of Israel were carried away captive to this country; but this does not seem probable; for there are no traces of Judaism remaining, all the inhabitants being either Gentoos or Mahometans. E. Long. 75. 25. N. Lat. 34. 30.

CASSINE, the CASSIOBERRY-BUSH or *South-sea Tea*; a genus of the trigynia order, belonging to the pentandria class of plants. There are three species, all of them natives of warm climates. Of these the most remarkable is the *yapon*, which is a native of the maritime parts of Virginia and Carolina. It rises to the height of ten or twelve feet, sending out branches from the ground upward, garnished with spear-shaped leaves placed alternately, which continues green through the year. The flowers are produced in close whorls round the branches, at the footstalks of the leaves; they are white, and divided into five parts, almost to the bottom. The berries are of a beautiful red colour, and as they continue most part of the winter upon the plants without being touched by the birds, we may reasonably conclude that they are possessed of a poisonous quality; as few of the wholesome innocent fruits escape their depredations. The Indians, however, have a great veneration for this plant, and at certain seasons of the year come in great numbers to fetch away the leaves. On such occasions their usual custom, says Miller, is to make a fire upon the ground, and, putting on it a great kettle full of water, they throw in a large quantity of yapon leaves; and when the water has boiled sufficiently, they drink large draughts of the decoction out of the kettle; which seldom fails to vomit them very severely. In this manner, however, they continue drinking and vomiting for three days together, until they imagine themselves sufficiently cleaned; they then gather every one a bundle of the shrub, and carry it home with them.—In the operation of these leaves by vomiting, those who have tasted of them say, that there is no uneasy sensation or pain. The matter discharged comes away in a full stream by the mouth, without any violence, or so much as disposing the patient to reach, or decline his head. The Spaniards who live near the gold mines of Peru, are frequently obliged to drink an infusion of this herb in order to moisten their breasts; without which they are liable to a sort of suffocation, from the strong metallic exhalations that are continually proceeding from the mines. In Paraguay, the Jesuits make a great revenue by importing the leaves of this plant into many countries under the name of Paraguay or South-sea tea, which is there drank in the same manner as that of China or Japan is with us. It is with difficulty preserved in England.

CASSINI (Johannes Dominicus), a most excellent astronomer, born at Piedmont in 1635. His early proficiency in astronomy procured him an invitation

Cassimire
Cassini.

Cassini
|
Cassius.

to be mathematical professor at Bologna when he was no more than 15 years of age; and a comet appearing in 1652, he discovered that comets were not accidental meteors, but of the same nature, and probably governed by the same laws, as the planets. In the same year he solved a problem given up by Kepler and Bullialdus as insolvable, which was, to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1663, he was appointed inspector-general of the fortifications of the castle of Urbino, and had afterward the care of all the rivers in the ecclesiastical state: he still however prosecuted his astronomical studies, by discovering the revolution of Mars round his own axis; and, in 1666, published his theory of Jupiter's satellites. Cassini was invited into France by Lewis XIV. in 1669, where he settled as the first professor in the royal observatory. In 1677 he demonstrated the line of Jupiter's diurnal rotation; and in 1684 discovered four more satellites belonging to Saturn, Huygens having found one before. He inhabited the royal observatory at Paris more than forty years; and when he died in 1712, was succeeded by his only son James Cassini.

CASSIODORUS (Marcus Aurelius), secretary of state to Theodoric king of the Goths, was born at Squillace, in the kingdom of Naples, about the year 470. He was consul in 514, and was in great credit under the reigns of Athalaric and Vitiges; but at seventy years of age retired into a monastery in Calabria, where he amused himself in making sundials, water hour-glasses, and perpetual lamps. He also formed a library; and composed several works, the best edition of which is that of father Garet, printed at Rouen in 1679. Those most esteemed are his Divine Institutions, and his treatise on the Soul. He died about the year 562.

CASSIOPEIA, in fabulous history, wife to Cepheus king of Ethiopia, and mother of Andromeda. She thought herself more beautiful than the Nereides, who desired Neptune to revenge the affront; so that he sent a sea-monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus; who obtained of Jupiter, that Cassiopeia might be placed after his death among the stars: hence the constellation of that name, in the northern hemisphere, situated opposite to the Great Bear, on the other side of the pole.

CASSITERIA, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin.

The cassiteria are of two kinds; the whitish pellucid cassiterion, and the brown cassiterion. The first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid; and is found in Devonshire and Cornwall principally. The brown cassiterion is like the former in figure: it is of a very smooth and glossy surface, and is also found in great plenty in Devonshire and Cornwall.

CASSIUS (Spurius), a renowned Roman general and consul, whose enemies accusing him of aspiring to royalty, he was thrown down from the Tarpeian rock,

485 years before Christ; after having thrice enjoyed the consular dignity, been once general of the horse under the first dictator that was created at Rome, and twice received the honour of a triumph.

CASSIUS (Longinus), a celebrated Roman lawyer, flourished 113 years before Christ. He was so inflexible a judge, that his tribunal was called the *Rock of the Impeached*. It is from the judicial severity of this Cassius, that very severe judges have been called *Cassians*.

CASSIUS (Cains), one of the murderers of Julius Cæsar: after his defeat by Mark Anthony at the battle of Philippi, he ordered one of his freed-men to put him to death with his own sword, 41 years before Christ.

CASSOCK, or CASSULA, a kind of robe or gown, wore over the rest of the habit, particularly by the clergy. The word cassock comes from the French *casaque*, an horseman's coat.

CASSOWARY, in ornithology. See STRUTHIO.

CASSUMBAZAR, a town of India, in Asia, situated on the river Ganges, in the province of Bengal: E. Long. 37. and N. Lat. 24.

CASSUMUAR, in the *Materia Medica*, a root approaching to that of zedoary.

It is cardiac and sudorific, and famous in nervous cases: it is also an ingredient in many compositions, and is prescribed in powders, holfuses, and infusions. Its dose is from five to fifteen grains.

CAST is peculiarly used to denote a figure or small statue of bronze. See BRONZE.

CAST, among founders, is applied to tubes of wax fitted in divers parts of a mould of the same matter, by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before possessed.

CAST also denotes a cylindrical piece of brass or copper, slit in two, lengthwise, used by the founders in sand, to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast.

CAST, among plumbers, denotes a little brazen funnel at one end of a mould, for casting pipes without soldering, by means of which the melted metal is poured into the mould.

CAST, or CASTE, in speaking of the eastern affairs, denotes a tribe, or number of families, of the same rank and profession. The division of a nation into casts chiefly obtains in the dominions of the Great Mogul, kingdom of Bengal, island of Ceylon, and the great peninsula opposite thereto. In each of these there are, according to father Martin, four principal casts, *viz.* the cast of the *bramins*, which is the first and most noble; the cast of the *rajās*, or princes, who pretend to be descended from divers royal families; the cast of the *choutres*, which comprehends all the artificers; and that of the *pariat*, the lowest and most contemptible of all: though Henry Lord, it must be observed, divides the Indians about Surat in four casts, somewhat differently from Martin, *viz.* into *bramins*, or priests; *cuttery*, or soldiers; *shudlers*, which we call banians, or merchants; and *wys*, the mechanics or artificers. Every art and trade is confined to its proper *cast*, nor is allowed to be exercised by

Cassius
|
Cast.

Castalio
Castell.

by any but those whole fathers professed the same. So that a taylor's son can never rise to be a painter, nor a painter's son fall to be a taylor; though there are some employments that are proper to all the casts, *e. g.* every body may be a soldier, or a merchant. There are also divers casts which are allowed to till the ground, but not all. The cast of *parias* is held infamous, inasmuch that it is a disgrace to have any dealings or conversation with them; and there are some trades in the cast of *choutres*, which debase their professors almost to the same rank. Thus shoemakers, and all artificers in leather, as also fishermen, and even shepherds, are reputed no better than *parias*.

CASTALIO (Sebastian), was born at Chetillon, on the Rhone, in the year 1515. Calvin conceived such an esteem and friendship for him, during the stay he made at Strasburg in 1540 and 1541, that he lodged him some days at his house, and procured him a regent's place in the college of Geneva. Castalio, after continuing in this office near three years, was forced to quit it in the year 1544, on account of some particular opinions which he held concerning Solomon's song, and Christ's descent into hell. He retired to Basil, where he was made Greek professor, and died in that place in 1564, aged 48. He incurred the high displeasure of Calvin and Theodore Beza, for differing with them concerning predestination and the punishment of heretics. His works are very considerable, both on account of their quality and number. In 1545, he printed at Basil four books of dialogues, containing the principal histories of the bible in elegant Latin; so that youth might thereby make a proficiency in piety and in the Latin tongue at the same time. But his principal work is a Latin and French translation of the scriptures. He began the Latin translation at Geneva in 1542, and finished it at Basil in 1550. It was printed at Basil in 1551, and dedicated by the author to Edward VI. king of England. The French version was dedicated to Henry II. of France, and printed at Basil in 1555. The fault which has been most generally condemned in his Latin translation, is the affectation of using only classical terms.

CASTANEA, in botany. See FAGUS.

CATANOVITZ, a town of Croatia, situated on the river Unna, which divides Christendom from Turkey. E. Long. 17. 20. N. Lat. 45. 40. It is subject to the house of Austria.

CASTEL (Lewis Bertrand), a learned Jesuit, was born at Montpellier in 1688, and entered among the Jesuits in 1703. He studied polite literature in his youth; and at length applied himself entirely to the study of mathematics and natural philosophy. He distinguished himself by writing on gravity; the mathematics; and on the music of colours, a very whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled *Traité de la Pensateur universelle*, was printed at Paris, in 1724. He afterwards published his *Mathématique universelle*; which occasioned his being unanimously chosen a fellow of the Royal Society of London, without the least solicitation. He was also a member of the academies of Bourdeaux and Ronen: but his *Clavecin*

oculaire made the most noise; and he spent much time and expence in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, *Le Plan du Mathématique abrégé*, and a treatise entitled *Optique des Couleurs*. He led a very exemplary life, and died in 1757.

CASTELAMARA, a town of Italy, in the kingdom of Naples, and in the hither Principato, with a bishop's see, and a good harbour. E. Long. 14. 25. N. Lat. 41. 40.

CASTEL-ARAGONESA, a strong town of Italy, in the island of Sardinia, with a bishop's see, and a good harbour. It is seated on the N. W. coast of the island, in E. Long. 8. 57. N. Lat. 40. 56.

CASTEL-BRANCO, a town of Portugal, and capital of the province of Beira; seated on the river Lyra, 35 miles N. W. of Alcantara. W. Long. 8. 0. N. Lat. 39. 35.

CASTEL-FRANCO, a very small, but well fortified frontier town of the Bolognese, in Italy, belonging to the Pope.

CASTEL-DE-VIDE, a small strong town of Alentejo. It was taken by Philip V. W. Long. 6. 25. N. Lat. 39. 15.

CASTEL-FOLIT, a town of Spain, in Catalonia, seated on an inaccessible eminence, between Gironne and Campredon, about 15 miles from each, and near the river Fulva.

CASTEL-GANDOLFO, a town of Italy, in the territory of the church, with a castle, to which the Pope retires in the summer season; 10 miles S. by E. of Rome. E. Long. 12. 46. N. Lat. 41. 44.

CASTEL-NOVO, a strong town of Dalmatia, subject to the Venetians; seated on the gulph of Cataio, in E. Long. 18. 45. N. Lat. 42. 25.

CASTEL-RODRIGO, a town of Portugal, in the province of Tra-os-Montes, in W. Long. 7. 1. N. Lat. 41. 0.

CASTEL-NOVO-DE-CARFAGNANA, a town of Italy, in the Modenese, with a strong fortress. It is the capital of the valley of Carfagnana; and seated on the river Serchio, 17 miles above Lucca.

CASTEL DEL OVO, a small island in the Tuscan Sea, in the gulph of Naples, near a town of that name, to which it is joined by a stone bridge. The fortress is called Castel del Ovo, in which there is always a good garrison.

CASTELBAR, a town of Ireland, in the county of Mayo, and province of Connaught, 35 miles N. of Galway. W. Long. 9. 25. N. Lat. 53. 45.

CASTELL (Edmund) D. D. a learned English divine of the 17th century, distinguished by his skill in the eastern languages. He was educated at Cambridge; where he was master of Catherine hall, and Arabic professor; and was at length canon of Canterbury. He had the greatest share in the Polyglott bible of London; and wrote the *Heptaglotton pro septem Orientalibus*, &c. On this excellent work, which occupied a great part of his life, he bestowed incredible pains and expence, even to the breaking of his constitution, and exhausting of his fortune, having expended no less than 12,000 *l.* upon that work. At length, when it was printed, the copies remained 10-fold

Castelamara
Castell.

Castella
||
Castiglioni.

fold upon his hands. He died in 1685; and lies buried in the church-yard of Higham Gobyon in Bedfordshire, of which he was rector. It appears from the inscription on his monument, which he erected in his lifetime, that he was chaplain to Charles II. He bequeathed all his oriental manuscripts to the university of Cambridge, on condition that his name should be written on every copy in the collection.

CASTELLA, a town of the Mantuan, in Italy, about five miles north-east of the city of Mantua. E. Long. 11. 15. N. Lat. 45. 30.

CASTELLAN, the name of a dignity or charge in Poland: The castellans are senators of the kingdom, but senators only of the lower class, who, in diets, sit on low seats, behind the palatines, or great senators. They are a kind of lieutenants of provinces, and command a part of the palatinate under the palatine.

CASTELLANY, the territory belonging to any city or town, chiefly used in France and Flanders: Thus we say, the castellany of Lisle, Ypres, &c.

CASTELLI (Bernard), an Italian painter, was born at Genoa in 1557; and excelled in colouring and in portraits. He was the intimate friend of Tasso, and took upon himself the task of designing and etching the figures of his Jerusalem Delivered. He died at Genoa in 1629.

Valerio Castelli, one of his sons, was born at Genoa in 1625, and surpassed his father. He particularly excelled in painting battles; and died in 1659.

CASTELVETRO (Lewis), a native of Modena, of the 16th century, famous for his *Comment on Aristotle's Poetics*. He was prosecuted by the inquisition for a certain book of Melancthon, which he had translated into Italian. He retired to Basil, where he died.

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating, with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting which on the soldiery was given to the tribunes. Some make it of two kinds; one with a stick or cane, called *fustigatio*; the other with rods, called *flagellatio*: the latter was the most dishonourable.

CASTIGLIONI (Balthazar), an eminent Italian nobleman, descended from an illustrious and ancient family, and born at his own villa at Cafalico in the duchy of Milan in 1478. He studied painting, sculpture, and architecture, as appears from a book he wrote in favour of these arts; and excelled so much in them, that Raphael Urbino, and Buonarroti, though incomparable artists, never thought their works complete without the approbation of Count Castiglioni. When he was 26 years of age, Guido Ubaldo, Duke of Urbino, sent him ambassador to Pope Julius II. He was sent upon a second embassy to Lewis XII. of France, and upon a third to Henry VII. of England. After he had dispatched his business here, he returned, and began his celebrated work intitled the *Courtier*; which he completed in Rome in 1516. This work is full of moral and political instruction; and if we seek for the Italian tongue in perfection, it is said to be nowhere better found than in this performance. A version of this work, together with the original I-

talian, was published at London in 1727, by A. P. Castiglioni, a gentleman of the same family, who resided there under the patronage of Dr Gibson bishop of London. Count Castiglioni was sent by Clement VII. to the court of the Emperor Charles V. in quality of legate; and died at Toledo in 1529.

CASTIGATORY for SCOLDS. A woman indicted for being a common scold, if convicted, shall be placed in a certain engine of correction, called the *trebucket*, *castigatory*, or *cucking-stool*; which, in the Saxon language, signifies the *scolding-stool*; though now it is frequently corrupted into the *ducking-stool*; because the residue of the judgment is, that, when she is placed therein, she shall be plunged in water for her punishment.

CASTIGLIONE, a small, but strong town of Italy, in Mantua, with a castle. It was taken by the Germans in 1701, and the French defeated the Imperialists near it in 1706. E. Long. 10. 29. N. Lat. 43. 23.

CASTILE, NEW. See TOLEDO.

CASTILLAN, or CASTILLANE, a gold-coin, current in Spain, and worth fourteen rials and sixteen deniers.

CASTILLAN is also a weight used in Spain for weighing gold. It is the hundredth part of a pound Spanish weight. What they commonly call a weight of gold in Spain, is always underitood of the castilian.

CASTILLARÁ, a town of the Mantuan in Italy, situated six miles north-east of the city of Mantua: E. Long. 11. 25. N. Lat. 45. 20.

CASTILLON, a town of Perigort, in the province of Guienne in France, situated on the river Dordogne, sixteen miles east of Bourdeaux: W. Long. 2. 40. N. Lat. 44. 50.

CASTING, in foundery, the running a metal into a mould, prepared for that purpose.

CASTING of Metals, of Letters, Balls, &c. See the article FOUNDERY.

CASTING in Sand or Earth is the running of metals between two frames, or molds, filled with sand or earth, wherein the figure that the metal is to take has been impressed *en creux*, by means of the pattern.

CASTING, among sculptors, implies the taking of casts and impressions of figures, busts, medals, leaves, &c.

The method of taking of casts of figures and busts is most generally by the use of plaster of Paris, i. e. alabaster calcined by a gentle heat. The advantage of using this substance preferably to others, is, that notwithstanding a slight calcination reduces it to a pulverine state, it becomes again a tenacious and cohering body, by being moistened with water, and afterwards suffered to dry; by which means either a concave or a convex figure may be given by a proper mold or model to it when wet, and retained by the hardness it acquires when dry: and from these qualities, it is fitted for the double purpose of making both casts, and molds for forming those casts. The particular manner of making casts depends on the form of the subject to be taken. Where there are no projecting parts, it is very simple and easy; as likewise where there are such as form only a right or any greater angle with the principal surface of the body: but where

Castiglioni
||
Castig.

Jacob's
Lure Dkg.

Casting.

where parts project in lesser angles, or form a curve inclined towards the principal surface of the body, the work is more difficult.

The first step to be taken is the forming the mold. In order to this, if the original or model be a bals relief, or any other piece of a flat form, having its surface first well greased, it must be placed on a proper table, and surrounded by a frame, the sides of which must be at such a distance from it as will allow a proper thickness for the sides of the mold. As much plaster as will be sufficient to cover and rise to such a thickness as may give sufficient strength to the mold, as also to fill the hollow betwixt the frame and the model, must be moistened with water, till it be just of such consistence as will allow it to be poured upon the model. This must be done as soon as possible; or the plaster would concrete or set, so as to become more troublesome in the working, or unfit to be used. The whole must then be suffered to remain in this condition, till the plaster has attained its hardness; and then the frame being taken away, the preparatory cast or mold thus formed may be taken off from the subject entire.

Where the model or original subject is of a round or erect form, a different method must be pursued; and the mold must be divided into several pieces: or if the subject consists of detached and projecting parts, it is frequently most expedient to cast such parts separately, and afterwards join them together.

Where the original subject or mold forms a round, or spheroid, or any part of such round or spheroid, more than one half the plaster must be used without any frame to keep it round the model; and must be tempered with water to such a consistence, that it may be wrought with the hand like very soft paste: but though it must not be so fluid as when prepared for flat figured models, it must yet be as moist as is compatible with its cohering sufficiently to hold together: and being thus prepared, it must be put upon the model, and compressed with the hand, or any flat instrument, that the parts of it may adapt themselves, in the most perfect manner, to those of the subject, as well as be compact with respect to themselves. When the model is so covered to a convenient thickness, the whole must be left at rest till the plaster be set and firm, so as to bear dividing without falling to pieces, or being liable to be put out of its form by slight violence; and it must then be divided into pieces, in order to its being taken off from the model, by cutting it with a knife with a very thin blade; and being divided, must be cautiously taken off, and kept till dry: but it must be always carefully observed, before the separation of the parts be made, to notch them cross the joints, or lines of the division, at proper distances, that they may with ease and certainty be properly conjoined again; which would be much more precarious and troublesome without such directive marks. The art of properly dividing the molds, in order to make them separate from the model, requires more dexterity and skill than any other thing in the art of casting; and does not admit of rules for the most advantageous conduct of it in every case. Where the subject is of a round or spheroidal form, it is best to divide the mold into three parts, which will

Vol. III.

Casting.

then easily come off from the model: and the same will hold good of a cylinder or any regular curve figure.

The mold being thus formed, and dry, and the parts put together, it must be first greased, and placed in such a position that the hollow may lie upwards, and then filled with plaster mixed with water, in the same proportion and manner as was directed for the casting the mold: and when the cast is perfectly set and dry, it must be taken out of the mold and repaired, where it is necessary; which finishes the whole operation.

This is all that is required with respect to subjects where the surfaces have the regularity above-mentioned: but where they form curves which intersect each other, the conduct of the operation must be varied with respect to the manner of taking the cast of the mold from off the subject or model; and where there are long projecting parts, such as legs or arms, they should be wrought in separate casts. The operator may easily judge from the original subjects, what parts will come off together, and what require to be separated: the principle of the whole consists only in this, that where under-workings, as they are called, occur; that is, wherever a straight line drawn from the basis or insertion of any projection, would be cut or crossed by any part of such projection, such part cannot be taken off without a division; which must be made either in the place where the projection would cross the straight line; or, as that is frequently difficult, the whole projection must be separated from the main body, and divided also lengthwise into two parts: and where there are no projections from the principal surfaces, but the body is so formed as to render the surface a composition of such curves, that a straight line being drawn parallel to the surface of one part would be cut by the out-line, in one or more places, of another part, a division of the whole should be made, so as to reduce the parts of it into regular curves, which must then be treated as such.

In larger masses, where there would otherwise be a great thickness of the plaster, a corps or body may be put within the mold, in order to produce a hollow in the cast; which both saves the expence of the plaster, and renders the cast lighter.

This corps may be of wood, where the forming a hollow of a straight figure, or a conical one with the basis outward, will answer the end: but if the cavity require to be round, or of any curve figure, the corps cannot be then drawn while entire; and consequently should be of such matter as may be taken out piecemeal. In this case, the corps is best formed of clay; which must be worked upon wires to give it tenacity, and suspended in the hollow of the mold, by cross wires lying over the mouth: and when the plaster is sufficiently set to bear handling, the clay must be picked out by a proper instrument.

Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchment size properly prepared, which will make it very firm and tenacious.

In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the molds of pla-

10 H

fter :

Casting.

fter : only the expence of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, render the use of clay, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel or stones; and then mixed with a third or more of fine sand to prevent its cracking; or, instead of sand, coal-ashes sifted fine may be used. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mold perfectly dry; otherwise the moisture, being rarified, will make an explosion that will blow the metal out of the mold, and endanger the operator, or at least crack the mold in such a manner as to frustrate the operation. Where the parts of a mold are larger, or project much, and consequently require a greater tenacity of the matter they are formed of to keep them together, flocks of cloth, prepared like those designed for paper-hangings, or fine cotton plucked or cut till it is very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mold. The proportion should be according to the degree of cohesion required: but a small quantity will answer the end, if the other ingredients of the composition be good, and the parts of the mold properly linked together by means of the wires above directed.

There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practised for some purposes with advantage; particularly for the decorating grottoes or rock-work, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects; the casts of which, if properly coloured, will be exact representations of the originals.

This is to be performed by the following method. A coffin or proper chest for forming the mold being prepared of clay, or four pieces of boards fixed together, the animal or parts of vegetables must be suspended in it by a string; and the leaves, tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated and adjusted in their right position by a small pair of pincers: a due quantity of plaster of Paris and calcined tale, in equal quantities, with some alumen plumosum, must then be tempered with water to the proper consistence for casting; and the subject from whence the cast is to be taken, as also the sides of the coffin, moistened with spirit of wine. The coffin or chest must then be filled with the tempered composition of the plaster and tale, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, in order that they may form, when drawn out after the matter of the mold is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise, by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mold. In a short time the plaster and tale will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mold was cast taken away: and the mold must then be put first into a mode-

Casting.

rate heat, and afterwards, when it is as dry as can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red-hot. The animal, or part of any vegetable, which was included in the mold, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes. The mold must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it: but it may be nevertheless proper to shake the mold, and turn it upside down, as also to blow with the bellows into each of the air-vents, in order to free it wholly from any remainder of the ashes; or, where there may be an opportunity of filling the hollow with quicksilver without expence, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies will necessarily rise to the surface of the quicksilver, and be poured out with it. The mold being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass: but a less degree will serve for lead or tin: and the matter being poured in, the mold must be gently struck: and then suffered to rest till it be cold: at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly, must be softened by soaking in water, till they be entirely loosened, that none of the more delicate parts of the cast may be broken off or bent.

Where the alumen plumosum, or tale, cannot easily be procured, the plaster may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly a texture: or, for cheapness, Sturbridge or any other good clay, washed over till it be perfectly fine, and mixed with an equal part of sand, and some flocks cut small, may be employed. Pounded pumice-stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent molds for this and parallel uses.

Casts of medals, or such small pieces as are of a similar form, may be made in plaster by the method directed for bals reliefs.

Indeed there is nothing more required than to form a mold by laying them on a proper board; and having surrounded them by a rim made of a piece of a card, or any other pasteboard, to fill the rim with soft tempered plaster of Paris: which mold, when dry, will serve for several casts. It is nevertheless a better method to form the mold of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster.

The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster.

For taking casts from medals, Dr Lewis recommends a mixture of flowers of brimstone, and red lead: equal parts of these are to be put over the fire

*Philosoph.
Commerce
of Arts*
in

Castling. in a laddle, till they soften to the consistence of pap; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the medal, previously oiled and wiped clean. The casts are very neat; their colour sometimes a pretty deep black, sometimes a dark grey: they are very durable; and when soiled, may be washed clean in spirits of wine.

Naturalist's Companion. Dr Letson recommends tin-foil for taking off casts from medals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, the point of a skewer, or a pin, till it has perfectly received the impression. The tin-foil should now be pared close to the edge of the medal, till it is brought to the same circumference: the medal must then be reversed, and the tin-foil will drop off into a chip-box or mold placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plaster of Paris prepared in the usual manner, may be poured. When dry, the whole is to be taken out, and the tin-foil sticking on the plaster, will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mold is a little larger than the medal, the plaster running round the tin-foil, will give the appearance of a white frame or circular border; whence the new made medal will appear more neat and beautiful.

Casts may be made likewise with iron, prepared in the following manner: "Take any iron-bar, or piece of a similar form; and having heated it red-hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel; and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their colour and weight." The iron will, by this means, be rendered so fusible, that it will run with less heat than is required to melt lead; and may be employed for making casts of medals, and many other such purposes, with great convenience and advantage.

Impressions of medals, having the same effect as casts, may be made also of isinglass glue, by the following means. Melt the isinglass, beaten, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved: then with a brush of camels hair, cover the medal, which should be previously well cleaned and warmed, and then laid horizontal on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened; and then, with a pin, raise the edge of it; and separate it carefully from the medal: the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or

the medal may be previously coated with leaf-gold by breathing on it, and then laying it on the leaf, which will by that means adhere to it: but the use of leaf-gold is apt to impair a little the sharpness of the impression.

Impressions of medals may be likewise taken in putty; but it should be the true kind made of calx of tin, and drying oil. These may be formed in the molds, previously taken in plaster or sulphur; or molds may be made in its own substance, in the manner directed for those of the plaster. Their impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Impressions of prints, or other engravings, may be taken from copper-plates, by cleansing them thoroughly, and pouring plaster upon them: but the effect, in this way, is not strong enough for the eye; and therefore the following method is preferable, where such impressions on plaster are desired.

Take vermilion, or any other coloured pigment, finely powdered, and rub it over the plate: then pass a folded piece of paper, or the flat part of the hand, over the plate, to take off the colour from the lights or parts where there is no engraving: the proceeding must then be the same as where no colour is used. This last method is also applicable to the making of impressions of copper-plates on paper with dry colours: for the plate being prepared as here directed, and laid on the paper properly moistened, and either passed under the rolling-press, or any other way strongly forced down on the paper, an impression of the engraving will be obtained.

Impressions may be likewise taken from copper-plates, either on plaster or paper, by means of the snoko of a candle or lamp; if, instead of rubbing them with any colour, the plate be held over the candle or lamp till the whole surface become black, and then wiped off by the flat of the hand, or paper.

These methods are not, however, of great use in the case of copper-plates, except where impressions may be desired on occasions where printing-ink cannot be procured: but as they may be applied likewise to the taking impressions from innish-boxes, or other engraved subjects, by which means designs may be instantly borrowed by artists or curious persons, they may in such instances be very useful.

The expedient of taking impressions by the snoko of a candle or lamp may be employed also for botanical purposes in the case of leaves, as a perfect and durable representation of not only the general figure, but the texture and disposition of the larger fibres, may be extemporaneously obtained at any time. The same may be nevertheless done in a more perfect manner, by the use of linseed oil, either alone, or mixed with a small proportion of colour, where the oil can be conveniently procured: but the other method is valuable on account of its being practicable at almost all seasons, and in all places, within the time that the leaves will keep fresh and plump. In taking these impressions, it is proper to bruise the leaves, so as to take off the projections of the large ribs, which might prevent the other parts from lying to the paper.

Leaves, as also the petals, or flower-leaves, of plants, may themselves be preserved on paper, with their

Castling
|
Castle.

their original appearance, for a considerable length of time, by the following means.—Take a piece of paper, and rub it over with the isinglass glue treated as above directed for taking impressions from medals; and then lay the leaves in a proper position on the paper. The glue laid on the paper being set, brush over the leaves with more of the same; and that being dry likewise, the operation will be finished, and the leaves so secured from the air and moisture, that they will retain their figure and colour much longer than by any other treatment.

Butterflies, or other small animals of a flat figure, may also be preserved in the same manner.

CASTING is also sometimes used for the quitting, laying, or throwing aside any thing; thus deer cast their horns, snakes their skins, lobsters their shells, hawks their feathers, &c. annually.

Castling of feathers is more properly called *moulting* or *mewing*.

A horse *casts* his hair, or coat, at least once a-year, viz. in the spring when he casts his winter coat; and sometimes, at the close of autumn, he casts his summer coat, in case he has been ill kept. Horses also sometimes *cast* their hoofs, which happens frequently to coach-horses brought from Holland: these, being bred in a moist marshy country, have their hoofs too flabby; so that coming into a drier soil, and less juicy provender, their hoofs fall off, and others that are tighter succeed.

CASTING a *Colt*, denotes a mare's proving abortive.

CASTING-*Net*, a sort of fishing-net so called, because it is to be *cast*, or thrown out; which when exactly done, nothing escapes it, but weeds and every thing within its extent are brought away.

CASTLE, a fortress, or place rendered defenceable either by nature or art. It frequently signifies with us the principal mansion of noblemen. In the time of Henry II, there were no less than 1115 castles in England, each of which contained a manor.

CASTLE, in ancient writers, denotes a town or village surrounded with a ditch and wall, furnished with towers at intervals, and guarded by a body of troops. The word is originally Latin, *castellum*, a diminutive from *castrum*. *Castellum* originally seems to have signified a smaller fort for a little garrison: though Suetonius uses the word where the fortification was large enough to contain a cohort. The *castella*, according to Vegetius, were often like towns, built on the borders of the empire, and where there were constant guards and fences against the enemy. Horsey takes them for much the same with what were otherwise denominated *stations*.

CASTLE, or *Castro-fled*, is also an appellation given by the country-people in the north to the Roman *castris*, as distinguished from the *castra stationa* which they usually call *cheshers*. Horsey represents this as an useful criterion, whereby to discover or distinguish a Roman camp or station. There are several of these castella on Severus's wall: they are generally 60 feet square; their north side is formed by the wall itself which falls in with them; the intervals between them are from six furlongs and an half to seven; they seem to have stood closest where the stations are widest. The neighbouring people call them

castles or *castro-fleeds*, by which it seems probable that their ancient Latin name had been *castellum*. Some modern writers call them *milo-castles*, or military *castella*: Horsey sometimes *expiratory castles*. In these *castella* the *arcani* had their stations, who were an order of men whose business was to make incursions into the enemies country, and give intelligence of their motions.

CASTLE, in the seelanguage, is a part of the ship, of which there are two: the fore-castle, being the elevation at the prow, or the uppermost deck, towards the mizen, the place where the kitchens are. Hind-castle is the elevation which reigns on the stern, over the last deck, where the officers cabins and places of assembly are.

CASTLE (Edmund). See CASTEL.

CASTLE-Gary, a remarkable Roman station about four miles west from Falkirk on the borders of Stirlingshire in Scotland. It comprehends several acres of ground, is of a square form, and is surrounded with a wall of stone and mortar: all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like an hill-top surrounded with a sunk fence. In 1770, some workmen employed in searching for stones for the great canal which passes very near it, discovered several apartments of stone; and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessel under which fire was put. In a hollow of the rock near this place, in 1771, a considerable quantity of wheat quite black with age was found, with some wedges and hammers supposed to be Roman.

CASTLE-Rising, a borough-town of Norfolk in England, which sends two members to parliament. E. Long. O. 40. N. Lat. 52. 46.

CASTLE-Work, service or labour done by inferior tenants, for the building and upholding castles of defence, toward which some gave their personal assistance, and others paid their contributions. This was one of the three necessary charges to which the Anglo-Saxons were expressly subject.

CASTLETOWN, the capital of the isle of Man, seated on the south-west part of the island. It has a strong castle; but of no great importance, on account of its distance from the rocky and shallow harbour. W. Long. 4. 39. N. Lat. 53. 30.

CASTOR, or BEAVER, in zoology, a genus of quadrupeds belonging to the order of glires. The foreteeth of the upper jaw are truncated, and hollowed in a transverse angular direction. The tops of the foreteeth of the lower jaw lie in a transverse direction; and the tail is depressed. There are three species of castor, viz. 1. The fiber, with a plain ovated tail, is found on the banks of the rivers in Europe, Asia, and America. It has short ears hid in the fur; a blunt nose; the forefeet small, the hinder large: its length from nose to tail about three feet, tail about one foot. It is from the inguinal glands of this animal that the castor is obtained; it is contained in cuds or pouches resembling a dog's testicles. Nothing equals the art with which these animals

Castle
|
Castor.

Cassor.

mals construct their dwellings. They chuse a level piece of ground, with a small rivulet running through it. They then form into a pond, by making a dam across; first by driving into the ground stakes of five or six feet in length, placed in rows, wattling each row with pliant twigs, and filling the interstices with clay, ramming it down close. The side next the water is sloped, the other perpendicular; the bottom is from ten to twelve feet thick; but the thickness gradually diminishes to the top, which is about two or three: the length of these dams is sometimes not less than 100 feet.

Their houses are made in the water collected by means of the dam, and are placed near the edge of the shore. They are built on piles; are either round or oval; but their tops are vaulted, so that their inside resembles an oven, the top a dome. The walls are two feet thick, made of earth, stones, and sticks, most artificially laid together; and the walls within are neatly plastered as if with a trowel. In each house are two openings, the one into the water, the other towards the land. The height of these houses above the water is eight feet. They often make two or three stories in each dwelling, for the convenience of change in case of floods. Each house contains from 20 to 30 beavers; and the number of houses in each pond is from 10 to 25. Each beaver forms its bed of moss; and each family forms its magazine of winter provisions, which consist of bark and boughs of trees. Those they lodge under water, and fetch into their apartments as occasion requires. Lawson says, they are fondest of the saffraas, ash, and sweet gum. Their summer food is leaves, fruits, and sometimes crabs and craw fish; but they are not fond of fish.

To effect these works, a community of two or three hundred assembles; each bears his share in the labour; some fall to gnawing with their teeth trees of great size, to form beams or piles; others roll the pieces along to the water; others dive, and with their feet scrape holes in order to place them in; while others exert their efforts to rear them in their proper places: another party is employed in collecting twigs to wattle the piles with; a third in collecting earth, stones, and clay; a fourth is busied in beating and tempering the mortar; others in carrying it on their broad tails to proper places, and with the same instrument ram it between the piles, or plaster the inside of their houses. A certain number of smart strokes given with their tails, is a signal made by the overseer for repairing to such and such places, either for mending any defect, or at the approach of an enemy; and the whole society attend to it with the utmost assiduity. Their time of building is early in summer; for in winter they never stir but to their magazines of provisions, and during that season are very fat. They breed once a-year, and bring forth at the latter end of the winter two or three young at a birth.

Besides these associated beavers, is another sort called *terriers*, which either want industry or sagacity to form houses like the others. They burrow in the banks of rivers, making their holes beneath the freezing depth of the water, and work up for a great

number of feet. These also form their winter flock of provision.

Beavers vary in their colours; the finest are black, but the general colour is a chestnut brown, more or less dark: some have been found, but very rarely, white. The skins are a prodigious article of trade, being the foundation of the hat-manufactory. In 1763 were sold, in a single sale of the Hudson's-bay company, 54,670 skins. They are distinguished by different names. *Coat-beaver* is what has been worn as coverlets by the Indians: *Fur-chest-beaver*, because the lower side resembles it: *Stag-beaver* is the worst, and is that which the Indians kill out of season, on their stages or journeys.

In hunting the beavers, the savages sometimes shoot them, always getting on the contrary side of the wind; for they are very shy, quick in hearing, and of a keen scent. This is generally done when the beavers are at work, or on shore feeding on poplar bark. If they hear any noise when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they went in.

They sometimes are taken with traps: these are nothing but poplar sticks laid in a path near the water; which when the beaver begins to feed upon, they cause a large log of wood to fall upon their necks, which is put in motion by their moving of the sticks, and consequently requires an ingenious contrivance. The savages generally prefer this way of taking them, because it does not damage their skins.

In the winter-time they break the ice in two places at a distance from the house, the one behind the other. Then they take away the broken ice with a kind of racket, the better to see where to place their stakes. They fasten their nets to these, which have large meshes, and sometimes are eighteen or twenty yards in length. When these are fixed, they proceed to demolish the house, and turn a dog therein; which terrifying the beaver, he immediately leaves it, and takes to the water; after which, he is soon entangled by the net.

2. The *muschatus*, with a long, compressed, lanceolated tail, and palmated feet. It has a long slender nose like that of a shrew-mouse; no external ears, and very small eyes. Length from nose to tail, seven inches; of the tail, eight. It is the water-rat of Clusius; and inhabits Lapland, Russia, the banks of the rivers Wolga, and the Yaick. It never wanders far from the sides; is very flow in its pace; makes holes in the cliffs, with the entrance far beneath the lowest fall of the water; works upwards, but never to the surface, only high enough to be beyond the highest flow of the river; feeds on fish; is devoured by the pikes and *fluri*, and gives those fish so strong a flavour of musk as to render them not eatable; has the same scent as the former, especially about the tail, out of which is expressed a sort of musk very much resembling the genuine kind. The skins are put into chests among clothes, to drive away moths. At Orenburg the skins and tails sell for 15 or 20 copees per hundred. They are so common near Nizney Novogorod, that the peasants bring 500 a-piece to market, where they are sold for one ruble per hundred.

Cassor.

Castor
||
Castoreum.

Castoreum
||
Castral.

hundred. The German name for these animals is *biefenratze*; the Russian, *wyechozol*.

3. The zibethicus or musk-rat, with a long, compressed, lanceolated tail, and the toes of the feet separated from each other. Length from nose to tail, one foot; of the tail, nine inches. This species inhabits North America, breeds three or four times in a year, and brings from three to six young ones at a time: during summer the male and female consort together: at the approach of winter they unite in families, and retire into small round edifices covered with a dome, formed of herbs and reeds cemented with clay: at the bottom are several pipes through which they pass in search of food: for they do not form magazines like the beavers: during winter their habitations are covered many feet deep with snow and ice; but they creep out and feed on the roots beneath: they quit their old habitations annually, and form new ones: the fur is soft and much esteemed: the whole animal, during summer, has a most exquisite smell of musk, which it loses in winter: perhaps the scent is derived from the *calamus aromaticus*, a favourite food of this animal. Lefcarbott says they are very good to eat.

CASTOR and POLLUX, in Pagan mythology. Jupiter having an amour with Leda, the wife of Tyndarus king of Sparta, in the form of a swan, she brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal; from the other Castor and Clytemnestra, who being begot by Tyndarus were both mortal. They were all, however, called by the common name of *Tyndaridae*. These two brothers entered into an inviolable friendship: they went with the other noble youths of Greece in the expedition to Colchis, and, on several occasions, signalized themselves by their courage; but Castor being at length killed, Pollux obtained leave to share his own immortality with him; so that they are said to live and die alternately every day: for, being translated into the skies, they form the constellation of gemini, one of which stars rises as the other sets.

A martial dance, called the *Pyrrhic* or *Castorian* dance, was invented in honour of these deities, whom the Cephelenes placed among the Dii Magni, and offered to them white lambs. The Romans also paid them particular honours on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

CASTOR and Pollux, two meteors, which, in a storm at sea, appear sticking to some part of the ship, in the shape of fire-balls: when only one is seen, it is more properly called Helena. The two together are adjudged to portend the cessation of the storm; but one alone portends ill, and that the severest part of the tempest is yet to come: both these balls are by some called *Tyndarides*.

CASTOREUM, in the *Materia Medica*, CASTOR; the inguinal glands of the beaver*. The ancients had a notion that it was lodged in the testicles; and

that the animals, when hard pressed, would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. The best sort of castor is what comes from Russia. So much is Russian castor superior to the American, that two guineas per pound is paid for the former, and only 8s. 6d. for the latter. The Russian castor is in large hard round cods, which appear, when cut, full of a brittle, red, liver-coloured substance, interspersed with membranes and fibres exquisitely interwoven. An inferior sort is brought from Dantzic, and is generally fat and moist. The American castor, which is the worst of all, is in longish thin cods. Russia castor has a strong disagreeable smell; and an acrid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof spirit both: water elevates the whole of its flavour in distillation; rectified spirit brings over nothing. Castor is looked upon as one of the capital nerve and antihysterical medicines: some celebrated practitioners, nevertheless, have doubted its virtues; and Newman and Stahl declare it insignificant. Experience, however, has shewn that the virtues of castor are considerable, though less than they have been generally supposed. See *MATERIA MEDICA*, n° 224.

CASTRATION, in surgery, the operation of gelding. It was prohibited by a decree of the senate of Rome under Hadrian; and the Cornelian law subjected the person who performed the operation, to the same penalties as the person on whom it was performed, although it was done with his consent.

Castration is much in use in Asia and Turkey, where it is practised upon the slaves, to prevent any commerce with their women. In Italy, castration is frequent from another motive, namely, to preserve the voice for singing*.

Castration is sometimes found necessary in surgical cases, as in a sarcocele and cancer of the testicles.

CASTRATION, among botanists, a term derived from the fancied analogy betwixt plants and animals. The castration of plants consists in cutting off the *antheræ*, or tops of the stamina, before they have attained maturity, and dispersed the pollen or fine dust contained within their substance. This operation has been frequently practised by the moderns, with a view to establish or confute the doctrine of the sexes of plants; the antheræ or tops being considered by the sexualists as the male organs of generation. The experiment of castration succeeds principally on plants which, like the melon, have their male flowers detached from the female. In such as have both male and female flowers contained within the same covers, this operation cannot be easily performed without endangering the neighbouring organs. The result of experiments on this subject by Linnæus, Alston, and other eminent botanists, may be seen under the article BOTANY, sect. iii.

CASTREL, a kind of hawk resembling the lanner in shape, but the hobby in size. The castrel is also called *kestrel*, and is of a slow and cowardly kind; her game is the grouse, though she will kill a partridge.

CASTRES,

* See *Castor*.

* See *En-much*.

Castres

Castruccio.

Castruccio
|
Casualties.

CASTRES, a city of Languedoc in France, about thirty-five miles east of Thoulouse. E. Long. 2. and N. Lat. 43. 40. It is a bishop's see.

CASTRO, the capital of the island of Chiloe, on the coast of Chili in South America. W. Long. 82. S. Lat. 43.

CASTRO is also the capital of a duchy of the same name in the Pope's territories in Italy, situated on the confines of Tuscany. E. Long. 12. 35. N. Lat. 42. 30.

CASTRUCCIO (Castracani), a celebrated Italian general, was born (nobody knows of whom) at Lucca in Florence in 1284, and left in a vineyard covered with leaves, where he was found by Dianora a widow lady, the sister of Antonio, a canon of St Michael in Lucca, who was defended from the illustrious family of the Castracani. The lady having no children, they resolved to bring him up, and educated him as carefully as he had been their own. They intended him for a priest; but he was scarcely 14 years old when he began to devote himself to military sports, and those violent exercises which suited his great strength of body. The factions named the *Guelphs* and *Gibelines* then shared all Italy between them; divided the Popes and the Emperors; and engaged in their different interests not only the members of the same town, but even those of the same family. Francisco, a considerable person on the side of the Gibelines, observing Castruccio's uncommon spirit and great qualities, prevailed with Antonio to let him turn soldier; on which Castruccio soon became acquainted with every thing belonging to that profession, and was made a lieutenant of a company of foot by Francisco Guinigi. In his first campaign he gave such proofs of his courage and conduct as spread his fame all over Lombardy; and Guinigi, dying soon after, committed to him the care of his son and the management of his estate. Still distinguishing himself by his exploits, he filled his commander in chief with such jealousy and envy, that he was imprisoned by stratagem in order to be put to death. But the people of Lucca soon released him, and afterwards chose him for their sovereign prince. The Gibelines considered him as the chief of their party; and those who had been banished from their country fled to him for protection, and unanimously promised, that if he could restore them to their estates, they would serve him so effectually that the sovereignty of their country should be his reward: Flattered by these promises, he entered into a league with the prince of Milan. He kept his army constantly on foot, employing it as best suited his own designs. For services he had done the Pope, he was made senator of Rome with more than ordinary ceremony; but, while there, received news which obliged him to hasten back to Lucca. The Florentines entered into a war with him, but Castruccio fought his way through them; and the supreme authority of Tuscany was ready to fall into his hands, when a period was put to his life. In May 1328, he gained a complete victory over his enemies, who amounted to 30,000 foot, and 10,000 horse; in which 22,000 of them were slain, with the loss of not quite 16,000 of his own men: but as he was returning from the field of battle, tired with the action, and covered

with sweat, he halted a little, in order to thank and caress his soldiers as they passed; when, the north wind blowing upon him, he was immediately seized with an ague, which he at first neglected, but it carried him off in a few days, in the 44th year of his age.

Machiavel, who has written the life of Castruccio, says, that he was not only an extraordinary man in his own age, but would have been so in any other. He was of a noble aspect, and of the most winning address. He had all the qualities that make a man great; was grateful to his friends, just to his subjects, terrible to his enemies. No man was more forward to encounter dangers; no man more careful to escape them. He had an uncommon preference of mind, and often made rapartees with great smartness. Some of them are recorded, which discover a singular turn of humour; and, for a specimen, we shall mention three or four of them.—Passing one day through a street where there was a house of bad fame, he surprised a young man, who was just coming out, and who, upon seeing him, was all over blushes and confusion: "Friend, you should not be ashamed when you come out, but when you go in."—One asking a favour of him with a thousand impertinent and superfluous words: "Hark you, friend; when you would have any thing with me for the future, send another man to ask it."—Another great talker having tired him with a tedious discourse, excused himself at last, by saying, he was afraid he had been troublesome. "No indeed, (replied he), for I did not mind one word you said."—He was forced to put a citizen of Lucca to death, who had formerly been a great instrument of his advancement; and being reproached by somebody for having dealt so severely with an old friend, replied, "No, you are mistaken, it was with a new foe."—One of his courtiers desirous to regale him, made a ball and invited him to it. Castruccio came, entertained himself among the ladies, danced, and did other things which did not seem to comport with the dignity of his rank. One of his friends intimating that such freedoms might diminish the reverence that ought to be paid him: "I thank you for your caution; but he who is reckoned wise all the day, will never be reckoned a fool at night."

CASU-CONSULTI, in law, a writ of entry granted where a tenant, by courtesy or for life, aliens either in fee, in tail, or for the term of another's life. It is brought by him in reversion against the person to whom such tenant does so alien to the prejudice of the reversioner in the tenant's life-time.

CASU-PROVISIO, in law, a writ of entry founded on the statute of Gloucester, where a tenant in dower aliens the lands she so holds in fee, or for life; and lies for the party in reversion against the alienor.

CASUAL, something that happens fortuitously, without any design, or any measures taken to bring it to pass.

CASUAL-REVENUES, are those which arise from forfeitures, confiscations, deaths, attainders, &c.

CASUAL THEOLOGY, a denomination given to what is more frequently called **CASISTRY**.

CASUALTIES OF SUPERIORITY, in Scots law, those

Casualty
Cat.

those duties and emoluments which a superior has a right to demand out of his vassal's estate, over and besides the constant yearly duties established by the rendering of his charter upon certain casual events.

CASUALTY, in a general sense, denotes an accident, or a thing happening by chance, not design. It is particularly used for an accident producing unnatural death.

CASUALTY, in Metallurgy. See **CAUSALTY**.

CASUIST, a person who propoies to resolve cases of conscience. Elcobar has made a collection of the opinions of all the casuists before him. M. Le Feore, preceptor of Lewis XIII. called the books of the casuists the art of quibbling with God; which does not seem far from truth, by reason of the multitude of distinctions and subtleties they abound withal. Mayer has published a bibliotheca of casuists, containing an account of all the writers on cases of conscience, ranged under three heads, the first comprehending the Lutheran, the second the Calvinist, and the third the Romish casuists.

CASUISTRY, the doctrine and science of conscience and its cases, with the rules and principles of resolving the same; drawn partly from natural reason or equity; partly from authority of scripture, the canon law, councils, fathers, &c. To casuistry belongs the decision of all difficulties arising about what a man may lawfully do or not do; what is sin or not sin; what things a man is obliged to do in order to discharge his duty, and what he may let alone without breach of it.

CASIUS AMISSIIONIS, in Scots law, in actions proving the tenor of obligations inextinguishable by the debtors retiring or cancelling them, it is necessary for the pursuer, before he is allowed a proof of the tenor, to condescend upon such a *casus amissionis*, or accident, by which the writing was destroyed, as shews it was lost while in the writer's possession.

CAT, in zoology. See **FELIS**.

CAT, in sea-affairs, a ship employed in the coal-trade, formed from the Norwegian model. It is distinguished by a narrow stern, projecting quarters, a deep *waist*, and by having ornamental figures on the prow. These vessels are generally built remarkably strong, and carry from four to six hundred tons, or, in the language of their own mariners, from 20 to 30 *kels* of coals.

CAT, is also a sort of strong tackle, or combination of pulleys, to hook and draw the anchor perpendicularly up to the *cat-head*. The use of this machine is represented, Plate LXXXII. fig. 4.

CAT-Fish, in ichthyology. See **SQUALUS**.

CAT-Gut, a denomination given to small strings for fiddles, and other instruments, made of the intestines of sheep or lambs, dried and twisted together, either singly, or several together. These are sometimes coloured red, sometimes blue, but are commonly left whitish or brownish, the natural colour of the gut. They are also used by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries from Lyons and Italy.

CAT-Harpings, a purchase of ropes employed to brace in the shrouds of the lower masts behind their

yards for the double purpose of making the shrouds more tight, and of affording room to draw in the yards more obliquely, to trim the sails for a side-wind, when they are laid to be close hauled.

CAT-bleads, two strong short beams of timber, which project almost horizontally over the ship's bows on each side of the bow-sprit; being like two radii which extend from a center taken in the direction of the bow-sprit. That part of the cat-head which rests upon the forecable, is securely bolted to the beams; the other part projects like a crane as above described, and carries in its extremity two or three small wheels or *sheaves* of brais or strong wood, about which a rope called the *cat-fall* passes, and communicates with the cat-block, which also contains three sheaves. The machine formed by this combination of pulleys is called the *Cat*, which serves to pull the anchor up to the cat-head, without tearing the ship's sides with its flukes. The cat-head also serves to suspend the anchor clear of the bow, when it is necessary to let it go: it is supported by a sort of knee, which is generally ornamented with sculpture.

The cat-block is filled with a large and strong hook, which catches the ring of the anchor when it is to be drawn up.

CAT of the Mountain. See **FELIS**.

CAT-Mint. See **MENTHA**.

CAT-Salt, a name given by our salt-workers to a very beautifully granulated kind of common salt. It is formed out of the bittern, or leach-brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under these troughs are placed vessels to receive this brine, and across them small sticks to which the cat-salt affixes itself in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, is very sharp and pungent, and is white when powdered, though pellucid in the mass. It is used by some for the table, but the greatest part of what is made of it is used by the makers of hard-soap.

CAT-Silver. See **MICA**.

CATACAUSTIC CURVES, in the higher geometry, that species of caustic curves which are formed by reflection. See **FLUXIONS**.

CATACHRESIS, in rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, describing Raphael's descent from the empyreal heaven to paradise, says,

"Down thither prone in flight,

"He speeds, and through the vast ethereal sky

"Sails between worlds and worlds."

CATACOMB, a grotto, or subterraneous place for the burial of the dead.

Some derive the word *catacomb* from the place where ships are laid up, which the modern Latins and Greeks call *cumbæ*. Others say, that *cata* was used for *ad*, and *catacumbas* for *adumbas*: accordingly, Dadin says, they anciently wrote *cataumbas*. Others fetch the word from the Greek *κρυα*, and *κρησος*, a hollow, cavity, or the like.

Anciently the word *catacomb* was only understood of the tombs of St Peter and St Paul; and M. Chastelain

Cat
Catacomb.

Plate lxxxii.
fig. 4.

Catacombs. Iain observes, that, among the more knowing of the people of Rome, the word *catacomb* is never applied to the subterraneous burying-places hereafter mentioned, but only to a chapel in St Sebastian, one of the seven national churches; where the ancient Roman calendars lay the body of St Peter was deposited, under the consulate of Tullius and Bassus, in 258.

CATACOMBS of Italy; a vast assemblage of subterranean sepulchres about Rome, chiefly at about three miles from that city in the Via Appia; supposed to be the sepulchres of the martyrs; and which are visited accordingly out of devotion, and relics thence taken and dispersed throughout the catholic countries after having been first baptized by the Pope under the name of some saint. These *catacombs* are said by many to be caves or cells wherein the primitive Christians hid and assembled themselves together, and where they interred such among them as were martyred. Each *catacomb* is three feet broad, and eight or ten high; running in form of an alley or gallery, and communicating with others: in many places they extend within a league of Rome. There is no masonry or vaulting therein, but each supports itself: the two sides, which we may look on as the *parietes* or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the same *catacomb*, parallel to the alley. They were commonly closed with large thick tiles, and sometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, tho' very rarely, the name of the deceased is found on the tile: frequently a palm is seen, painted or engraven, or the cipher Xp, which is commonly read *pro Christo*. The opinion held by many Protestant authors is, that the *catacombs* are heathen sepulchres, and the same with the *puticuli* mentioned by Festus Pompeius; maintaining, that whereas it was the practice of the ancient Romans to burn their dead, the custom was, to avoid expence, to throw the bodies of their slaves to rot in holes of the ground; and that the Roman Christians, observing, at length, the great veneration paid to relics, resolved to have a stock of their own: entering, therefore, the *catacombs*, they added what ciphers and inscriptions they pleased; and then shut them up again, to be opened on a favourable occasion. Those in the secret, add they, dying or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former. Mr Monro, in the *Philosophical Transactions*, supposes the *catacombs* to have been originally the common sepulchres of the first Romans, and dug in consequence of these two opinions, *viz.* That shades hate the light; and that they love to hover about the places where the bodies are laid.

Though the catacombs of Rome have made the greatest noise of any in the world, there are such belonging to many other cities. Those of Naples, according to bishop Burnet, are much more noble and spacious than the catacombs of Rome. Catacombs have also been discovered at Syracuse, and Catania in Sicily, and in the island of Malta. The Roman catacombs take particular names from the churches in their neighbourhood, and seem to divide

the circumference of the city without the walls between them, extending their galleries every where under, and a vast way from it; so that all the ground under Rome, and for many miles about it, some say 20, is hollow. The largest, and those commonly shewn to strangers, are the catacombs of San Sebastiano, those of Saint Agnese, and the others in the fields a little off Saint Agnese. Women are only allowed to go into the catacombs in the church-yard of the Vatican on Whitfun-Monday, under pain of excommunication. There are men kept constantly at work in the *catacombs*. As soon as these labourers discover a grave with any of the supposed marks of a saint upon it, intimation is given to the cardinal Comerlingo, who immediately sends men of reputation to the place, where finding the palm, the monogram, the coloured glass, &c. the remains of the body are taken up with great respect, and translated to Rome. After the labourers have examined a gallery, they stop up the entry that leads to it; so that most of them remain thus closed up; only a few being left open, to keep up the trade of shewing them to strangers. This they do to prevent people from losing themselves in these subterraneous labyrinths, which indeed has often happened; but more probably to deprive the public of the means of knowing whither and how far the catacombs are carried.

The method of preserving the dead in catacombs seems to have been common to a number of the ancient nations. The catacombs of Egypt are still extant, about nine leagues from the city of Grand Cairo, and two miles from the city of Zaccara. They extend from thence to the pyramids of Pharaoh, which are about eight miles distant. They lie in a field covered with a fine running sand, of a yellowish colour. The country is dry and hilly; the entrance of the tomb is choked up with sand; there are many open, but more that are still concealed.

The bodies found in catacombs, especially those of Egypt, are called *mummies*; and as their flesh was formerly reckoned an efficacious medicine, they were much sought after. In this work the labourers were often obliged to clear away the sand for weeks together, without finding what they wanted. Upon coming to a little square opening of about 18 feet in depth, they descend into it by holes for the feet, placed at proper intervals; and there they are sure of finding a mummy. These caves, or *wells*, as they call them there, are hollowed out of a white freestone, which is found in all this country a few feet below the covering of sand. When one gets to the bottom of these, which are sometimes 40 feet below the surface, there are several square openings on each side, into passages of 10 or 15 feet wide; and these lead to chambers of 15 or 20 feet square. These are all hewn out into the rock; and in each of the catacombs are to be found several of these apartments communicating with one another. They extend a great way under ground, so as to be under the city of Memphis, and in a manner to undermine its environs. In some of the chambers the walls are adorned with figures and hieroglyphics; in others the mummies are found in tombs, round the apartment hollowed out in the rock.

Cataleptis
Catalonia.

The Egyptians seem to have excelled in the art of embalming and preserving their dead bodies; as the mummies found in the Egyptian catacombs are in a better state than the bodies found either in the Italian catacombs, or those of any other part of the world. See EMBALMING and MUMMY.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phœnicians throughout the countries to which they sent colonies: the interring as we now do, in the open air, or in temples, was first introduced by the Christians. When an ancient hero died or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported entire, they fell on the expedient of burning, in order to bring home the ashes, to oblige the *manes* to follow; that so his country might not be destitute of the benefit of his tutelage. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus *catacombs* became disused among the Romans, after they had borrowed the manner of burning from the Greeks, and then none but slaves were laid in the ground. See BURIAL, &c.

CATALEPSIS, *καταληψις*, or CATALEPSY, in medicine, a kind of apoplexy; or a drowsy disease, wherein the patient is taken speechless, senseless, and fixed in the same posture wherein the disease first seized him; his eyes open, without seeing or understanding. See (Index subjoined to) MEDICINE.

CATALOGUE, a list or enumeration of the names of several books, men, or other things, according to a certain order.

CATALONIA, a province of Spain, bounded on the north by the Pyrenean mountains, which divide it from France; by the kingdom of Arragon and Valencia on the west; and by the Mediterranean sea on the south and east. It is 155 miles in length, and 100 in breadth. It is watered by a great number of rivers; the principal of which are the Lobregat, the Ter, the Tet, and the Segra. The air is temperate and healthy; but the land is mountainous, except in a few places. It produces, however, corn, wine, oil, pulse, flax, and hemp, sufficient for the inhabitants. The mountains are covered with large forests of tall trees, such as the oak, the ever-green oak, the beech, the pine, the fir, the chestnut, and many others; with cork-trees, shrubs, and medicinal plants. There are several quarries of marble of all colours, crystal, alabaster, amethysts, and lapis lazuli. Gold dust has been found among the sands of one or two of the rivers; and there are mines of tin, iron, lead, alum, vitriol, and salt. They likewise fish for coral on the eastern coast. The inhabitants are hardy, courageous, active, vigorous, and good soldiers, but apt to be discontented. The miquelets are a sort of soldiers which guard the passes over the mountains, and ought to protect travellers; but if they are not paid to their minds, they seldom fail to pay themselves. The river Lobregat divides Catalonia into two parts, the east and west, according to their situation. This province comprehends 17 vigueries or territories; two of which are in Roussillon, and belong to the French.

The rest are subject to the Spaniards. The principal towns are Barcelona the capital, Tarragona, Tortosa, Lerida, Solsona, Cardona Vich, Girona, Seu d'Urgel, Pui Cerdà, and Cervera.

CATAMENIA, in medicine. See MENSES.

CATAMITE, a boy kept for sodomitical practices.

CATANANCHE, CANDIA LIONS-FOOT; a genus of the polygamia æqualis order, belonging to the lychnædia class of plants. There are three species, of which the cerulea is the most remarkable. This sends out many long, narrow, hairy leaves, which are jagged on their edges like those of the buckhorn plantain, but broader; the jags are deeper, and at greater distances; these lie flat on the ground, turning their points upwards. Between the leaves come out the flower-stalks, which are in number proportionable to the size of the plants; for, from an old thriving root, there are frequently eight or ten, while young plants do not send out above two or three. These stalks rise near two feet high, dividing into many small branches upward, garnished with leaves like those below, but smaller, and without jags on their edges: each of these smaller branches are terminated by single heads of flowers, of a fine blue colour. This is a perennial plant, and may be propagated by seeds or slips. The seeds may be sown, in the spring, on a bed of common earth; and, in the autumn following, the plants may be removed to the places where they are to remain. The seeds ripen in August. This plant is a pretty ornament in gardens, and is easily kept within bounds.

CATANEA, a city of Sicily, seated on a gulph of the same name, near the foot of Mount Etna or Gibel. It suffered greatly by earthquakes in 1669 and 1693. This last overturned the city in a moment. Eighteen thousand of the inhabitants perished in the ruins, and yet the fertility of the soil has caused it to be re-peopled. E. Long. 15. 19. N. Lat. 37. 30.

CATANZARO, a city in the kingdom of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and is seated on a mountain, in E. Long. 18. 20. N. Lat. 38. 58.

CATAPHONICS, the science which considers the properties of reflected sounds. See ACOUSTICS.

CATAPHORA, in medicine, the same as COMA.

CATAPHRACTA, in antiquity, a kind of coat of mail, which, covered the soldier from head to foot. Hence cataphracts were horsemen armed with the cataphracts; whose horses, as Sallust says, were covered with linen full of iron plates disposed like feathers.

CATAPLASMA, a poultice; from *καταπλάσσω*, *illino*, to spread like a plaster. Cataplasms take their name sometimes from the part to which they are applied or effects they produce; so are called anacolema, frontale, epicarpium, epispasticum, vesicatorium; and, when mustard is an ingredient, they are called sinapisms.

These kind of applications are softer, and more easy, than plasters or ointments. They are formed of some vegetable substances, and applied of such a consistence as neither to adhere nor run: they are also

Cataplasma
|
Catapulta.

Catapulta.

also more useful when the intention is effected by the perpetuity of the heat or cold which they contain, for they retain them longer than any other kind of composition.

When designed to *relax*, or to promote suppuration, they should be applied warm. Their warmth, moisture, and the obstruction they give to perspiration, is the method of their answering that end. The proper heat, when applied warm, is no more than to promote a kindly pleasant sensation; for great heat prevents the design for which they are used. They should be renewed as often as they cool. For relaxing and suppurating, none excel the whitebread poultice, made with the crumb of an old loaf, a sufficient quantity of milk to boil the bread in until it is soft, and a little oil; which last ingredient, besides preventing the poultice from drying and sticking to the skin, also retains the heat longer than the bread and milk alone would do. To preserve the heat longer, the poultice, when applied, may be covered with a strong ox's bladder.

When designed to *repel*, they should be applied cold, and ought to be renewed as oft as they become warm. A proper composition for this end, is a mixture of oat-meal and vinegar.

CATAPULTA, in antiquity, a military engine contrived for the throwing of arrows, darts, and stones upon the enemy.—Some of these engines were of such force that they would throw stones of an hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men from one end to the other, was the phalanx ever so deep. This was called the

Battering CATAPULTA, and is represented on Plate LXXII. fig. 1. This catapulta is supposed to carry a stone, &c. of an hundred weight, and therefore a description of it will be sufficient to explain the doctrine of all the rest; for such as threw stones of twelve-hundred and upwards were constructed on the same principles.

The base is composed of two large beams 2, 3. The length of those beams is fifteen diameters of the bore of the capitals 9. At the two extremities of each beam, two double mortises are cut to receive the eight tenons of two cross beams, each of them four of the diameters in length. In the centre of each of the beams of the base, and near two thirds of their length, a hole, perfectly round, and 16 inches in diameter, should be bored: these holes must be exactly opposite to each other, and should increase gradually to the inside of the beams, so that each of them, being 16 inches on the outside towards the capitals 9, should be $1\frac{1}{2}$ at the opening on the inside, and the edges carefully rounded off. The capitals 9 are, in a manner, the soul of the machine, and serve to twist and strain the cordage, which form its principle or power of motion.

The capitals are either of cast brass, or iron; each consisting of a wheel with teeth, C 10, of $2\frac{1}{2}$ inches thick. The hollow or bore of these wheels should be 11 $\frac{1}{2}$ inches in diameter, perfectly round, and the edges smoothed down. As the friction would be too great,

if the capitals rubbed against the beams by the extreme straining of the cordage, which draws them towards these beams, that inconvenience is remedied by the means of eight friction-wheels, or cylinders of brass, about the 13th of an inch in diameter, and an inch and one sixth in length, placed circularly, and turning upon axes, as represented at D 13, and B 12. One of these friction-wheels at large with its screw, by which it is fastened into the beam, is represented at A.

Upon this number of cylindrical wheels the capitals 9 must be placed in the beams 2, 3, so that the cylinders do not extend to the teeth of the wheels, which must receive a strong pinion 14. By the means of this pinion the wheel of the capital is made to turn for straining the cordage with the key 15. The capital wheel has a strong catch 16, and another of the same kind may be added to prevent any thing from giving way through the extreme and violent force of the strained cordage.

The capital-piece of the machine is a nut or cross-pin of iron, 17, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts, and fixed in grooves about an inch deep. This piece, or nut, ought to be about two inches and one third thick at the top 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inserted in the capitals.

After placing the two capitals in the holes of the two beams in a right line with each other, and fixing the two cross diametrical nuts or pieces over which the cordage is to wind, one end of the cord is reeved through a hole in one of the capitals in the base, and made fast to a nail within-side of the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the cross-pieces of iron in the centre of the two capitals, till they are full, the cordage forming a large skain. The tension or straining of the cordage ought to be exactly equal, that is, the several foldings of the cord over the capital-pieces should be equally strained, and so near each other as not to leave the least space between them. As soon as the first folding or skain of cord has filled up one whole space or breadth of the capital-pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and the skain of cordage entirely fills them, observing to rub it from time to time with soap.

At three or four inches behind the cordage, thus wound over the capital pieces, two very strong upright beams 21 are raised: these are posts of oak 14 inches thick, crossed over at top by another of the same solidity. The height of the upright beams is $7\frac{1}{2}$ diameters; each supported behind with very strong props 25, fixed at bottom in the extremities of the base 2, 3. The cross-beam 24 is supported in the same manner by a prop in the centre.

The tree, arm, or stylus 22, should be of found ash. Its length is from 15 to 16 diameters of the bore

Catapulta
Catáro.

of the capitals. The end at the bottom, or that fixed in the middle of the ikain, is 10 inches thick, and 14 broad. To strengthen the arm or tree, it should be wrapped round with a cloth dipped in strong glue, like the tree of a fiddle, and bound very hard with waxed thread of the sixth of an inch in diameter from the large end at bottom, almost to the top, as represented in the figure.

At the top of the arm, just under the iron-hand or receiver 27, a strong cord is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the hook of a brass pulley 23 is put. The cord 20 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which serves as a stay, is then brought to it, and made fast by its hook to the extremity of the hand 27, in which the body to be discharged is placed. The pulley at the neck of the arm is then unhooked; and when the trigger is to let it off, a stroke must be given upon it with an iron-bar or crow of about an inch in diameter; on which the arm flies up with a force almost equal to that of a modern mortar. The cushion or stomacher 23, placed exactly in the middle of the cross-beam 24, should be covered with tanned ox-hide, and stuffed with hair, the arm striking against it with inconceivable force. It is to be observed, that the tree or arm 22 describes an angle of 90 degrees, beginning at the cock, and ending at the stomacher or cushion.

CATAPULTA for *Arrows, Spears or Darts*. Some of the spears, &c. thrown by these engines, are said to have been 18 feet long, and to have been thrown with such velocity as to take fire in their course.

Plate lxxii.
fig. 2.

A B C D is the frame that holds the darts or arrows, which may be of different numbers, and placed in different directions. E F is a large and strong iron spring, which is bent by a rope that goes over three pulleys, I, K, L; and is drawn by one or several men; this rope may be fastened to a pin at M. The rope, therefore, being set at liberty, the spring must strike the darts with great violence, and send them, with surprising velocity, to a great distance. This instrument differs in some particulars from the description we have of that of the ancients; principally in the throwing of several darts at the same time, one only being thrown by theirs.

CATARACT, in hydrography, a precipice in the channel of a river, caused by rocks, or other obstacles, stopping the course of the stream, from whence the water falls with a greater noise and impetuosity: Such are the cataracts of the Nile, the Danube, Rhine, and the famous one of Niagara in America.

CATARACT, in medicine and surgery, a disorder of the humours of the eye, by which the pupilla, that ought to appear transparent and black, looks opaque, blue, grey, brown, &c. by which vision is variously impeded, or totally destroyed. See **SURGERY**.

CATARO, a town of Dalmatia, and capital of the territory of the same name, with a strong castle, and a bishop's see. It is subject to Venice, and seated on a gulph of the same name. E. Long. 19. 19. N. Lat. 42. 25.

CATARACTES, in ornithology, the trivial name *Cataractes* of a species of **LARUS**.

CALARRH, in medicine, a distillation or defluxion from the head upon the mouth and aspera arteria, and through them upon the lungs. See (the *Index* subjoined to) **MEDICINE**.

CATASTASIS, in poetry, the third part of the ancient drama; being that wherein the intrigue, or action, set forth in the epitasis, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scudiger defines it, the full growth of the fable, while things are at a stand in that confusion to which the poet has brought them.

CATASTROPHE, in dramatic poetry, the fourth and last part in the ancient drama, or, that immediately succeeding the catastasis: or according to others, the third only; the whole drama being divided into protasis, epitasis, and catastrophe; or, in the terms of Aristotle, prologue, epilogue, and exode.

The catastrophe clears up every thing, and is nothing else but the discovery or winding up of the plot. It has its peculiar place: for it ought entirely to be contained, not only in the last act, but in the very conclusion of it; and when the plot is finished, the play should be so also. The catastrophe ought to turn upon a single point, or start up on a sudden.

The great art in the catastrophe is, that the clearing up of all difficulties may appear wonderful, and yet easy, simple, and natural.

It is a very preposterous artifice of some writers to shew the catastrophe in the very title of the play. Mr Dryden thinks that a catastrophe refusing from a mere change in the sentiments and resolutions of a person, without any other machinery, may be so managed as to be exceeding beautiful.

It is a dispute among the critics, whether the catastrophe should always fall out favourably on the side of virtue or not. The reasons on the negative side seem the strongest. Aristotle prefers a shocking catastrophe to a happy one.—The catastrophe is either simple or complex. The first is that in which there is no change in the state of the principal persons, nor any discovery or unravelling, the plot being only a mere passage out of agitation into quiet repose. In the second, the principal persons undergo a change of fortune, in the manner already defined.

CATCH, in the musical sense of the word, a fugue in the unison, wherein, to humour some conceit in the words, the melody is broken, and the sense interrupted in one part, and caught again or supported by another; as in the catch in Shakespeare's play of the twelfth-night, where there is a catch sung by three persons, in which the humour is, that each who sings, calls and is called *knave* in turn.

CATCH-Fly, in botany. See **LYCHNIS**.

CATCH-Pole, (quasi one that *catches* by the *pole*), a term used, by way of reproach, for the bailiff's follower or assistant.

CATCH-Word, among printers, that placed at the bottom of each page, being always the first word of the following page.

CATECHESIS, in a general sense, denotes an instruction given any person in the first rudiments of an art or science; but more particularly of the Christian religion

Cataractes
↑
Catechesis.

Catechetic
Catechumen.
men.

Catechumen.
Catenaria.

religion. In the ancient church, catechesis was an instruction given *viva voce* , either to children, or adult heathens, preparatory to their receiving of baptism. In this sense, *catechesis* stands contra-distin-
guished from *mystagogica* , which was a higher part of instruction given to those already initiated, and containing the mysteries of faith. Those who give such instructions are called *catechists* ; and those who receive them, *catechumens* .

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of Christianity.—Catechetic schools were buildings appointed for the office of the catechist, adjoining to the church, and called *catechumenæ* : such was that in which Origen and many other famous men read catechetical lectures at Alexandria. See CATECHUMEN.

CATECHISM, in its primary sense, an instruction, or institution, in the principles of the Christian religion, delivered *viva voce* , and so as to require frequent repetitions, from the disciple or hearer, of what has been said. The word is formed from *καταρχη* , a compound of *κατα* and *αρχη* , q. d. *circum foris* , alluding to the noise or din made in this sort of exercise, or to the zeal and earnestness wherewith things are to be inculcated over and over on the learners.—Anciently the candidates for baptism were only to be instructed in the secrets of their religion by tradition *viva voce* , without writing; as had also been the case among the Egyptian priests, and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth.

CATECHISM is more frequently used in modern times for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, *κατηχηστας, catecheta* , he that catechises, i. e. he that instructs novices in the principles of religion.

CATECHIST more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith.—The catechists of churches were ministers usually distinct from the bishops and presbyters, and had their auditories or *catechumenæ* apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the catechists did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even readers or deacons, were the catechists. Origen seems to have had no higher degree in the church than reader, when he was made catechist at Alexandria, being only 18 years of age, and consequently incapable of the deaconship.

CATECHU, in the materia medica, the name of a troche consisting of Japan earth and gum arabic, each two ounces, and of sugar of roses sixteen ounces, beat together with a little water. It is recommended as a mild restraining, &c.

CATECHUMEN, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumens, in church-history, were the lowest order of Christians in the primitive church. They

had some title to the common name of Christian, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to the state of catechumens by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction: but at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first were those instructed privately without the church, and kept at a distance for some time from the privilege of entering the church, to make them the more eager and desirous of it. The next degree were the *audientes* , so called from their being admitted to hear sermons, and the scriptures read in the church, but were not allowed to partake of the prayers. The third sort of catechumens were the *genu-flectentes* , so called because they received imposition of hands kneeling. The fourth order was the *competentes & electi* , denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival; before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination, they were exercised for twenty days together, and were obliged to fasting and confession: some days before baptism they went veiled; and it was customary to touch their ears, saying, *Ephatha* , i. e. Be opened; as also to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

CATEGORICAL, in a general sense, is applied to those things ranged under a CATEGORY.

CATEGORICAL also imports a thing to be absolute, not relative; in which sense it stands opposed to *hypothetical* . We say, a *categorical* proposition, a *categorical* syllogism, &c.

A *categorical* answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORY, in logic, a series or order of all the predicates or attributes contained under any genus.

The school-philosophers distribute all the objects of our thoughts and ideas into certain *genera* or *classes* , not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know: and these classes the Greeks called *categories* , and the Latins *predicaments* .

Aristotle made ten categories, viz. quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

*Arbor, sex, servus, ardore, refrigerat, usus,
Ruri cras stans, nec tunicatus ero.*

CATEK. See BENGAL, n° 4.

CATENARIA, in the higher geometry, the name of a curve-line formed by a rope hanging freely from two

Eater.

two points of suspension, whether the points be horizontal or not. See FLUXIONS.

CATERPILLAR, in zoology, the name of all winged insects when in their reptile or worm-state. See ERUCA.

Method of Destroying CATERPILLARS on Trees.—Take a chafing dish with lighted charcoal, and placing it under the branches that are loaded with caterpillars, throw some pinches of brimstone upon the coals. The vapour of the sulphur, which is mortal to these insects, will not only destroy all that are on the tree, but prevent it from being infested with them afterwards. A pound of sulphur will clear as many trees as grow on several acres. This method has been successfully tried in France. In the *Journal Oeconomique*, the following is said to be infallible against the caterpillars feeding on cabbage, and perhaps may be equally serviceable against those that infest other vegetables. Sow with hemp all the borders of the ground where you mean to plant your cabbage; and, although the neighbourhood is infested with caterpillars, the space inclosed by the hemp will be perfectly free, not one of the vermin will approach it.

CATERPILLAR-Eaters, a name given by some authors to a species of worms bred in the body of the caterpillar, and which eat its flesh: these are owing to a certain kind of fly that lodges her eggs in the body of this animal, and they, after their proper changes, become flies like their parents.

Mr Reaumur has given us, in his history of insects, some very curious particulars in regard to these little worms. Every one of them, he observes, spins itself a very beautiful case of a cylindric figure, made of a very strong sort of silk: these are the cases in which this animal spends its state of chrysalis; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad stripe or band surrounding their middle, which is black when the rest of the case is white, and white when that is black. Mr Reaumur has had the pains and patience to find out the reason of this singularity, which is this: the whole shell is spun of a silk produced out of the creature's body; this at first runs all white, and towards the end of the spinning turns black. The outside of the case must necessarily be formed first, as the creature works from within: consequently this is truly white all over, but it is transparent, and shows the last spun or black silk through it. It might be supposed that the whole inside of the shell should be black; but this is not the case: the whole is fashioned before this black silk comes; and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle; and so gives either a black band in the middle, or a blackness at both ends, leaving the white in the middle to appear. It is not unfrequent to find a sort of small cases, lying about garden-walks, which move of themselves; when these are opened, they are found to contain a small living worm. This is one of the species of these caterpillar-eaters; which, as soon as it comes out of the body of that animal, spins itself a case for its transformation

Catebæa
|
Catherine.

long before that happens, and lives in it without food till that change comes on; and it becomes a fly like that to which it owed its birth.

CATESBÆA, the **LILY-THORN**; a genus of the monogynia order, belonging to the tetrandria class of plants. There is only one species, viz. the spinosa, which was discovered in the island of Providence by Mr Cateby, who gathered the seeds, and brought them to England. It rises to the height of ten or twelve feet, and is covered with a pale russet bark; the branches come out alternately, and are garnished with small leaves resembling those of the box-tree, coming out in clusters all round the branches at certain distances; the flowers hang downward, and come out from the side of the branches: they are tubulous, and near six inches long, very narrow at their base, but widening upwards towards the top, where it is divided into four parts which spread open, and are reflexed backward. They are of a dull yellow colour. This plant is propagated by seeds which must be procured from the country where it grows. The seeds must be sown on a hot-bed, and are to be treated in the same manner as other tender exotics.

CATHÆRETICS, in pharmacy, medicines of a caustic nature, serving to eat off proud flesh.

CATHARTICS, in medicine, remedies which promote evacuation by stool. See MATERIA MEDICA, n° 54, &c.

CATHECU, in botany. See ARECA.

CATHEDRA, in a general sense, a chair.—The word is more particularly used for a professor's chair, and a preacher's pulpit.

CATHEDRA is also used for the bishop's see, or throne, in a church.

CATHEDRAL, a church wherein is a bishop's see or seat: See CHURCH, and BISHOP. The word comes from the Greek *καθίδρα*, "chair," of *καθίσταμαι*, *sedeo*, "I sit." The denomination *cathedral* seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive Christians: in these, the council, i. e. the elders and priests, was called *Presbyterium*; at their head was the bishop, who held the place of chairman, *Cathedralis*, or *Cathedraticus*; and the presbyters, who sat on either side, were also called by the ancient fathers, *Assessores Episcoporum*. The episcopal authority did not reside in the bishop alone; but in all the presbyters, whereof the bishop was president. A *cathedral* therefore, originally, was different from what it is now; the Christians, till the time of Constantine, having no liberty to build any temple: by their churches they only meant their assemblies; and by *cathedrals*, nothing more than consistories.

CATHERINE PARR, daughter of Sir Thomas Parr, and widow of Nevil Lord Latimer, became afterward the 6th wife of Henry VIII. whom she had the great good fortune to survive, after having been in no small danger on account of her inclination to the reformed doctrines. Upon Henry's death, she married Lord Seymour, brother to the Duke of Somerset, and died in child-bed in 1548. This queen published *Prayers*, or *Meditations*, &c. 12mo, 1545; and among her papers after her death, there was found a contrite meditation on the years she had passed in popery, entitled,

Catherine
|
Cathetus.

Cathetus
|
Cato.

titled, *Queen Catharine Parr's Lamentation of a Sinner, bewailing the ignorance of her blind life*. This was published, with a preface by the great Lord Burleigh, 8vo, 1548, and 1563.

CATHERINE I. *Empress of Russia*, was raised to that dignity, from the low condition of a menial servant, by the discerning Peter the Great, who married her in 1711. She attended the Emperor in all his expeditions; and when he was surrounded by the Turks on the banks of the Pruth, his army was saved by her prudent advice. Peter, afterwards, never resolved on any affair of consequence without first consulting her; success attended him in every thing, and the court of Peterburgh appeared in a new light. He instituted the order of St Katherine in her honour, which gave her power to bestow on such of her sex as the judged proper; and, finally, appointed her his successor. On the death of her husband, she took all proper means to secure the quiet, advance the civilization, and promote the general welfare, of her kingdom; and it is more than probable, that the reigning illustrious Empress Catherine II. has considered her as a bright example: for Catherine I. established the academy of sciences at Peterburgh, now brought to such perfection. She likewise increased the naval force of Russia; and set on foot a design for discovering the north-east passage to China. "The lenity of this princess," (says Voltaire, in his *Life of Peter the Great*), "was carried to a degree unparalleled in the history of any nation. She promised, that, during her reign, nobody should be put to death; and she kept her word: she was the first sovereign that ever shewed this respect to the human species. Malefactors were condemned to work in the mines, and other public works; a regulation not less prudent than humane, since their punishment was rendered of some advantage to the state." She died on the 17th of May 1727; leaving issue, Anne who married Frederic Duke of Holstein, and Elizabeth the late Empress of Russia.

CATHERLOUGH, a town of Ireland, in the county of Catherlough, and province of Leinster; seated on the river Barrow, 16 miles N. E. of Kilkenny. W. Long. 7. 1. N. Lat. 52. 45.

CATHERLOUGH, a county of Ireland, about 28 miles in length, and 8 in breadth; bounded on the east by Wicklow and Wexford, on the west by Queen's county, on the north by Kildare, and on the south and south-west by Wexford. It contains 5600 houses, 42 parishes, five baronies, or boroughs, and sends six members to parliament, viz. two for the county, two for Catherlough, and two for Old Leighlin.

CATHETER, in surgery, a fistulous instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed.

CATHETUS, in geometry, a line or radius falling perpendicularly on another line or surface; thus the catheti of a right-angled triangle, are the two sides that include the right angle.

CATHETUS of Incidence, in catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line.

CATHETUS of Reflexion, or of the Eye, a right line

drawn from the eye perpendicular to the reflecting plane.

CATHETUS of Obliquation, a right line drawn perpendicular to the speculum, in the point of incidence or reflection.

CATHETUS, in architecture, a perpendicular line, supposed to pass through the middle of a cylindrical body, as a balluster, column, &c.

CATHNESS. See CATNESS.

CATHOLIC, in a general sense, denotes any thing that is universal or general.

CATHOLIC Church. The rise of heresies induced the primitive Christian church to assume to itself the appellation of *catholic*, being a characteristic to distinguish itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians.

The Romish church distinguishes itself now by the name of *catholic*, in opposition to all those who have separated from her communion, and whom she considers as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no catholic church in being, that is, no universal Christian communion.

CATHOLIC King, a title which hath been hereditary to the Kings of Spain, ever since Alphonsus, who, having gained several victories over the Saracens, and re-established the Christian faith in Spain, was honoured with the title of Catholic. Some say it was in the time of Ferdinand and Isabella.

CATHOLICON, in pharmacy, a kind of soft purgative electuary, so called, as being supposed an universal purger of all humours.

CATILINE (Lucius), a Roman of a noble family, who having spent his whole fortune in debauchery, formed the design of oppressing his country, destroying the senate, seizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow-citizens. In order to succeed in this design, he drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was discovered by the vigilance of Cicero, who was then consul. Upon which, retiring from Rome, he put himself at the head of an army, with several of the conspirators, and fought with incredible valour against Petreus, lieutenant to Anthony, who was colleague with Cicero in the consulship; but was defeated and killed in battle.—Sallust has given an excellent history of this conspiracy.

CATO (Marcus Portius), the Censor, one of the greatest men among the ancients, was born at Tusculum in the year of Rome 519, about the 232^d before Christ. He began to bear arms at 17; and, on all occasions, shewed extraordinary courage. He was a man of great sobriety, and reckoned no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he looked after and dressed it himself. At his return from his campaigns, he betook himself to plough his ground; not that he was without slaves to do it, but it was his inclination. He dressed also like his slaves, sat down at the same table with them, and partook of the same fare. He did not in the mean while neglect to cultivate

Cato.

tivate his mind, especially in regard to the art of speaking; and he employed his talents, which were very great, in generously pleading causes in the neighbouring cities, without fee or reward. Valerius Flaccus, who had a country-seat near Cato, conceiving an esteem for him, persuaded him to come to Rome; where Cato, by his own merit, and the influence of so powerful a patron, was soon taken notice of, and promoted. He was first of all elected tribune of the soldiers for the province of Sicily. He was next made questor in Africa under Scipio. Having in this last office reproved him for his profuse-ness to his soldiers, the general answered, that "he did not want so exact a questor, but would make war at what expence he pleased; nor was he to give an account to the Roman people of the money he spent, but of his enterprises, and the execution of them." Cato, provoked at this answer, left Sicily, and returned to Rome.

Afterwards Cato was made prætor, when he fulfilled the duties of his office with the strictest justice. He conquered Sardinia, governed with admirable moderation, and was created consul. Being tribune in the war of Syria, he gave distinguished proofs of his valour against Antiochus the Great; and at his return stood candidate for the office of censor. But the nobles, who not only envied him as a new man, but dreaded his severity, set up against him seven powerful competitors. Valerius Flaccus, who had introduced him into public life, and had been his colleague in the consulship, was a ninth candidate, and these two united their interests. On this occasion Cato, far from employing soft words to the people, or giving hopes of gentleness or complaisance in the execution of his office, loudly declared from the rostra, with a threatening look and voice, "That the times required firm and vigorous magistrates, to put a stop to that growing luxury which menaced the republic with ruin; censors who would cut up the evil by the roots, and restore the rigour of ancient discipline." It is to the honour of the people of Rome, that, notwithstanding these terrible intimations, they preferred him to all his competitors, who courted them by promises of a mild and easy administration: the comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformations he had in view. Cato's merit, upon the whole, was superior to that of any of the great men who stood against him. He was temperate, brave, and indefatigable; frugal of the public money, and not to be corrupted. There is scarce any talent requisite for public or private life which he had not received from nature, or acquired by industry. He was a great soldier, an able statesman, an eloquent orator, a learned historian, and very knowing in rural affairs. Yet, with all these accomplishments, he had very great faults. His ambition being poisoned with envy, disturbed both his own peace and that of the whole city as long as he lived. Though he would not take bribes, he was unmerciful and unconscionable in amassing wealth by all such means as the law did not punish.

The first act of Cato in his new office, was naming his colleague to be prince of the senate: after which

Cato.

the censors struck out of the list of the senators the names of seven persons; among whom was Lucius the brother of T. Flaminius. Lucius, when consul, and commanding in Gaul, had with his own hand murdered a Boian of distinction, a defector to the Romans; and he had committed this murder purely to gratify the curiosity of his pathic, a young Carthaginian, who, longing to see some body die a violent death, had reproached the general for bringing him away from Rome just when there was going to be a fight of gladiators. Titus Flaminius, full of indignation at the dishonour done to his brother, brought the affair before the people; and insisted upon Cato's giving the reason of his proceeding. The censor related the story; and when Lucius denied the fact, put him to his oath. The accused, refusing to swear, was deemed guilty; and Cato's censure was approved. But no part of the censor's conduct seemed so cruel to the nobles and their wives, as the taxes he laid upon luxury in all its branches; dress, household-furniture, women's toilets, chariots, slaves, and equipage. These articles were all taxed at three per cent. of the real value. The people, however, in general, were pleased with his regulations; inasmuch that they ordered a statue to be erected to his honour in the temple of *Health*, with an inscription that mentioned nothing of his victories or triumph, but imposed only that by his wife ordinances in his censorship he had reformed the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expressing their surprise, that while many persons without merit or reputation had statues, he had none; he answered, "I had much rather it should be asked why the people have not erected a statue to Cato, than why they have." Cato was the occasion of the third Punic war. Being dispatched to Africa to terminate a difference between the Carthaginians and the king of Numidia, on his return to Rome he reported, that Carthage was grown excessively rich and populous, and he warmly exhorted the senate to destroy a city and republic, during the existence of which, Rome could never be safe. Having brought from Africa some very large figs, he shewed them to the conscript fathers in one of the lappets of his gown. "The country, (says he), where this fine fruit grows, is but a three days voyage from Rome." We are told, that from this time he never spoke in the senate upon any subject, without concluding with these words, "I am also of opinion, that Carthage ought to be destroyed." He judged, that, for a people debauched by prosperity, nothing was more to be feared than a rival state, always powerful, and now from its misfortunes grown wise and circumspect. He held it necessary to remove all dangers that could be apprehended from *without*, when the republic had *within* so many distempers threatening her destruction.

From the censor dignified and severe, the reader will not perhaps be displeased to turn his view upon Cato sociable and relaxed. For we should have a false notion of him, if we imagined that nothing but a sad austerity prevailed in his speech and behaviour. On the contrary, he was extremely free; and often with his friends at table intermixed the conversation with lively discourses and witty sayings. Of these Plutarch

has

Cato.

Oeuvres
diverses,
P. 49.

has collected a pretty large number; we shall relate but one, and make use of Balzac's paraphrase, and the preface with which he introduces it. "The very censurers, though I hadness seemed to be one of the functions of their office, did not altogether lay aside railery. They were not always bent upon severity; and the first Cato, that troublefome and intolerable honest man, ceased sometimes to be troublefome and intolerable. He had some glimpses of mirth, and some intervals of good humour. He dropped now and then some words that were not unpleasant, and you may judge of the rest by this. He had married a very handsome wife; and history tells us that she was extremely afraid of the thunder, and loved her husband well. These two passions prompted her to the same thing; she always pitched upon her husband as a sanctuary against thunder, and threw herself into his arms at the first noise she fancied she heard in the sky. Cato, who was well pleased with the storm, and very willing to be careless, could not conceal his joy. He revealed that domestic secret to his friends; and told them one day, speaking of his wife, "that she had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry." It is worth observing, that this was during his censorship; when he degraded the senator Manlius, who would probably have been consul the year after, only for giving a kiss to his wife in the day-time, and in the presence of his daughter.

Cato died in the year of Rome 604, aged 85. He wrote several works. 1. A Roman history. 2. Concerning the art of war. 3. Of rhetoric. 4. A treatise of husbandry. Of these, the last only is extant.

CATO (Marcus Porcius), commonly called *Cato minor*, or Cato of *Utica*, was great grandson of Cato the censor. It is said, that from his infancy he discovered, by his speech, by his countenance, and even his childish sports and recreations, an inflexibility of mind; for he would force himself to go through with whatever he had undertaken, though the task was ill-suited to his strength. He was rough towards those that flattered him, and quite untractable when threatened; was rarely seen to laugh, or even to smile; was not easily provoked to anger; but if once incensed, hard to be pacified. Sylla having had a friendship for the father of Cato, sent often for him and his brother, and talked familiarly with them. Cato, who was then about 14 years of age, seeing the heads of great men brought there, and observing the sighs of those that were present, asked his preceptor, "Why does no body kill this man?" Because, said the other, he is more feared than he is hated. The boy replied, Why then did you not give me a sword when you brought me hither, that I might have flabbed him, and freed my country from this slavery?

He learned the principles of the Stoic philosophy, which so well suited his character, under Antipater of Tyre, and applied himself diligently to the study of it. Eloquence he likewise studied, as a necessary means to defend the cause of justice, and he made a very considerable proficiency in that science. To increase his bodily strength, he inured himself to suffer the extremes of heat and cold; and used to make journeys on foot, and bare-headed in all seasons. When

he was sick, patience and abstinence were his only remedies: he shut himself up, and would see no body till he was well. Though remarkably sober in the beginning of his life, making it a rule to drink but once after supper, and then retire, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends endeavoured to excuse this, by saying that the affairs of the public engrossed his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Cæsar wrote that Cato was once found dead drunk at the corner of a street, early in the morning, by a great number of people who were going to the levee of some great man; and that when, by uncovering his face, they perceived who it was, they blushed for shame: "You would have thought, (added Cæsar), that Cato had found them drunk, not they him." Pliny observes, that by this reflection Cæsar praises his enemy at the same time that he blames him. And Seneca, his extravagant panegyrist, ventures to assert, that it is easier to prove drunkenness to be a virtue, than Cato to be vicious. He affected singularity, and, in things indifferent, to act directly contrary to the taste and fashions of the age. Magnanimity and constancy are generally ascribed to him; and Seneca would fain make that haughtiness and contempt for others, which in Cato accompanied those virtues, a matter of praise. Cato, says Seneca, having received a blow in the face, neither took revenge nor was angry; he did not even *pardon the affront*, but *denied that he had received it*. His virtue raised him so high, that injury could not reach him. He is reputed to have been chaste in his youth. His first love was Lepida; but when the marriage was upon the point of being concluded, Metellus Scipio, to whom she had been promised, interfered, and the preference was given to him. This affront extremely exasperated our Stoic. He was for going to law with Scipio; and when his friends had diverted him from that design, by shewing him the ridicule of it, he revenged himself by making verses upon his rival. When this first flame subsided, he married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for her very indifcreet conduct.

He served as a volunteer under Gallius in the war of Spartacus; and when military rewards were offered him by the commander, he refused them, because he thought he had no right to them. Some years after, he went a legionary tribune into Macedonia under the prætor Rubrius: in which station he appeared, in his dress, and during a march, more like a private soldier than an officer: but the dignity of his manners, the elevation of his sentiments, and the superiority of his views, set him far above those who bore the titles of generals and proconsuls. It is said, that Cato's design in all his behaviour was to engage the soldiers to the love of virtue; whose affections he engaged thereby to himself, without his having that in his intention. "For the sincere love of virtue, (adds Plutarch), implies an affection for the virtuous. Those who praise the worthy without loving them, pay homage to their glory; but are neither admirers, nor imitators of their virtues." When the time of

Cato.

Cato.

his service expired, and he was leaving the army, the soldiers were all in tears ; so effectually had he gained their hearts by his condescending manners, and sharing in their labours. After his return home, he was chosen to the questorship ; and had scarce entered on his charge, when he made a great reformation in the questor's office, and particularly with regard to the registers. These registers, whose places were for life, and through whose hands passed incessantly all the public accounts, being to act under young magistrates unexperienced in business, assumed an air of importance ; and, instead of asking orders from the questors, pretended to direct and govern as if they themselves were the questors. Cato reduced them to their proper sphere.

One thing by which Cato extremely pleased the people, was his making the assassins to whom Sylla had given considerable rewards out of the treasury, for murdering the proscribed, disgorge their gains. Plutarch tells us, that Cato was so exact in discharging the duties of a senator, as to be always the first who came to the house, and the last who left it ; and that he never quitted Rome during those days when the senate was to sit. Nor did he fail to be present at every assembly of the people, that he might save those who, by an ill-judged facility, bestowed the public money in largesses, and frequently, through mere favour, granted remission of debts due to the state. At first his austerity and stiffness displeased his colleagues ; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. Cato very readily took upon him the task of refusing.

Cato, to keep out a very bad man, put in for the tribunate. He sided with Cicero against Catiline, and opposed Cæsar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking ; yet none could find fault with his conduct.

Cato laboured to bring about an agreement between Cæsar and Pompey ; but seeing it in vain, he sided with the latter. When Pompey was slain, he fled to Utica ; and being pursued by Cæsar, advised his friends to be gone, and throw themselves on Cæsar's clemency. His son, however, remained with him ; and Statilius, a young man, remarkable for his hatred to Cæsar.

The evening before the execution of the purpose he had formed with regard to himself, after bathing, he supped with his friends, and the magistrates of the city. They sat late at table, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that " the wife man alone is free, " and that the vicious are slaves," Demetrius, who was a Peripatetic, undertook to confute it from the maxims of his school. Cato, in answer, treated the matter very amply ; and with so much earnestness and vehemence of voice, that he betrayed himself, and confirmed the suspicions of his friends, that he designed to kill himself. When he had done speaking, a melancholy silence ensued ; and Cato perceiving it, turned the discourse to the present situation of affairs,

expressing his concern for those who had been obliged to put to sea, as well as for those who had determined to make their escape by land, had a dry and sandy desert to pass. After supper, the company being dismissed, he walked for some time with a few friends, and gave his orders to the officers of the guard : and going into his chamber, he embraced his son and his friends with more than usual tenderness, which farther confirmed the suspicions of the resolution he had taken. Then laying himself down on his bed, he took up Plato's Dialogue on the Immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed while he was at supper, he called a slave, and asked who had taken it away ; and receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword ; and, without shewing any impatience, ordered it to be brought to him : but, having read out the book, and finding nobody had brought him his sword, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence, that he very much hurt his own hand, crying out in a passionate manner, " What ! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy ? " Immediately his son and friends rushed into the room ; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking fiercely at them, " How long is it, said he, since I have lost my senses, and my son is become my keeper ? Brave and generous son, why do you not bind your father's hands, that when Cæsar comes, he may find me unable to defend myself ? Do you imagine that without a sword I cannot end my life ? Cannot I destroy myself by holding my breath for some moments, or by striking my head against the wall ? " His son answered with his tears, and retired. Apollonides and Demetrius remained with him, and to them he addressed himself in the following words : " Is it to watch over me that you sit silent here ? Do you pretend to force a man of my years to live ? or can you bring any reason to prove, that it is not base and unworthy of Cato to beg his safety of an enemy ? or why do you not persuade me to unlearn what I have been taught, that, rejecting all the opinions I have hitherto defended, I may now, by Cæsar's means, grow wiser, and be yet more obliged to him than for life alone ? Not that I have determined any thing concerning myself ; but I would have it in my power to perform what I shall think fit to resolve upon : and I shall not fail to ask your counsel, when I have occasion to act up to the principles which your philosophy teaches. Go tell my son, that he should not compel his father to what he cannot persuade him." They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp ; " Now, (said he,) I am my own master." And, laying it down, he took up his book again, which, it is reported, he read twice over. After this he slept so soundly that he was heard to snore by those who were near him. About midnight he called two of his freedmen, Cleantes his physician, and Butas whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the

Cato.

Romans

Romans were gone; to the physician he gave his hand to be dressed, which was twelled by the blow he had given his slave. This being an intimation that he intended to live, gave great joy to his family. Butas soon returned, and brought word that they were all gone except Crassus, who had staid upon some business, but was just ready to depart. He added, that the wind was high, and the sea rough. These words drew a sigh from Cato. He sent Butas again to the port to know, whether there might not be some one, who, in the hurry of embarkation, had forgot some necessary provisions, and had been obliged to put back to Utica. It was now break of day, and Cato slept yet a little more, till Butas returned to tell him, that all was perfectly quiet. He then ordered him to shut his door; and he flung himself upon his bed, as if he meant to finish his night's rest; but immediately he took his sword, and stabbed himself a little below his chest; yet not being able to use his hand so well by reason of the swelling, the blow did not kill him. It threw him into a convulsion, in which he fell from his

bed, and overturned a table near it. The noise gave the alarm; and his son, and the rest of the family, entering the room, found him weltering in his blood, and his bowels half cut of his body. The surgeon, upon examination, found that his bowels were not cut; and was preparing to replace them, and bind up the wound, when Cato, recovering his senses, thrust the surgeon from him, and, tearing out his bowels, immediately expired, in the 48th year of his age.

By this rash act, independent of all moral or religious considerations, he carried his patriotism to the highest degree of political frenzy: for Cato, dead, could be of no use to his country; but, had he preserved his life, his counsel might have moderated Caesar's ambition, and (as Montesquieu observes) have given a different turn to public affairs.

CATOCHE, or CATOCHEUS, a disease, by which the patient is rendered in an instant as immoveable as a statue, without either sense or motion, and continues in the same posture he was in at the moment of his being seized. See (the *Index* subjoined to) MEDICINE.

CATOPTRICS.

CATOPTRICS is that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

As this and the other branches of OPTICS are fully treated under the collective word, we shall, in the present article, 1st, Just give a summary of the principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2^{dly}, Insert a list of entertaining experiments founded upon them.

SECT. I. Definitions.

Definitions. 1. Every polished body that reflects the rays of light is called a mirror, whether its surface be plane, spherical, conical, cylindric, or of any other form whatever.

Plate lxiii. 2. Of mirrors there are three principally used in optical experiments, which are, the plane mirror, GHI, (fig. 3.) the spherical convex mirror, GHI, (fig. 4.) and the spherical concave mirror, GHI, (fig. 5.)

3. The point K, (fig. 4, 5.) round which the reflecting surface of a spherical mirror is described, is called its centre. The line KH, drawn from its center perpendicular to its two surfaces, is the axis of the mirror, and the point H, to which that line is drawn, is its vortex.

4. The distance between the lines AG and BG, (fig. 3.) is called the angle of incidence, and the distance between BG and CG is the angle of reflection.

SECT. II. Aphorisms.

I. In a plain mirror. 1. The image DF, (fig. 3.) will appear as far behind the mirror, as the object AC is before it.

2. The image will appear of the same size, and in the same position as the object.

3. Every such mirror will reflect the image of an object of twice its own length and breadth.

4. If the object be an opaque body, and its rays fall on the mirror nearly in direct lines, there will be only one image visible, which will be reflected by the inner surface of the glass. But

5. If the object be a luminous body, and its rays fall very obliquely on the mirror, there will appear, to an eye placed in a proper position, several images; the first of which, reflected from the outer surface of the glass, will not be so bright as the second, reflected from the inner surface. The following images, that are produced by the repeated reflections of the rays between the two surfaces of the glass, will be in proportion less vivid, to the eighth or tenth, which will be scarce visible.

1. The image DF, (fig. 4.) will always appear behind it.

2. The image will be in the same position as the object.

3. It will be less than the object.

4. It will be curved, but not, as the mirror, spherically.

5. Parallel rays falling on this mirror will have the focus or image at half the distance of the center K, from the mirror.

6. In converging rays, the distance of the object must be equal to half the distance of the center, to make the image appear behind the mirror.

7. Diverging rays will have their image at less than half the distance of the center. If the object be placed in the center of the mirror, its image will appear at one-eighth of that distance behind it.

1. That point where the image appears of the same dimensions as the object, is the center of that mirror.

2. Parallel rays will have their focus at one half the distance of the center.

3. Converging rays will form an image before the mirror.

4. In diverging rays, if the object be at less than one half the distance of the center, the image will be behind

behind the mirror, erect, curved, and magnified, as DEF, (fig. 5.) but if the distance of the object be greater, the image will be before the mirror, inverted and diminished, as DEF, (fig. 6.)

5. The sun's rays falling on a concave mirror, and being parallel, will be collected in a focus at half the distance of its center, where their heat will be augmented in proportion of the surface of the mirror to that of the focal spot.

6. If a luminous body be placed in the focus of a concave mirror, its rays being reflected in parallel lines, will strongly enlighten a space of the same dimension with the mirror, at a great distance. If the luminous object be placed nearer than the focus, its rays will diverge, and consequently enlighten a larger space. It is on this principle, that reverberators are constructed.

IV. In all plane and spherical mirrors the angle of incidence is equal to the angle of reflection.

SECT. III. Entertaining Experiments.

5
I. Catop-
tical illu-
sions.

I. Of all our senses the sight is certainly subject to the greatest illusion. The various writers on optics have described a great number of instances in which it deceives us, and have constantly endeavoured to investigate the causes, to explain their effects, and to reconcile appearance with reality. We every day discover new phenomena, and doubtless many more are reserved for posterity. It frequently happens, moreover, that a discovery which at first seemed of little consequence, has led to matters of the highest importance.

Plate lxxiii.

Take a glass bottle A, (fig. 4.) and fill it with water to the point B; leave the upper part BC empty, and cork it in the common manner. Place this bottle opposite a concave mirror, and beyond its focus, that it may appear reversed, and before the mirror (see sect. ii. aphor. 4. of aspher. concave mirror,) place yourself still further distant than the bottle, and it will appear to you in the situation *a, b, c*, (fig. 5.)

Now it is remarkable in this apparent bottle, that the water, which, according to all the laws of catoptrics, and all the experiments made on other objects, should appear at *a b*, appears on the contrary at *b c*, and consequently the part *a b* appears empty.

If the bottle be inverted and placed before the mirror, (as in fig. 6.) its image will appear in its natural, erect position; and the water, which is in reality at BC, will appear at *a b*.

If while the bottle is inverted it be uncorked, and the water run gently out, it will appear that while the part BC is emptying, that of *a b* in the image is filling; and what is likewise very remarkable, as soon as the bottle is empty the illusion ceases, the image also appearing entirely empty. If the bottle likewise be quite full there is no illusion.

If while the bottle is held inverted, and partly empty, some drops of water fall from the bottom A towards BC, it seems in the image as if there were formed at the bottom of the part *a b*, bubbles of air that rose from *a* to *b*; which is the part that seems full of water. All these phenomena constantly appear.

The remarkable circumstances in this experiment, are, first, not only to see an object where it is not, but also where its image is not; and secondly, that of two objects which are really in the same place, as the surface of the bottle and the water it contains, the one is seen at one place, and the other at another; and to see the bottle in the place of its image, and the water where neither it, nor its image, are.

11. Construct a box AB, of about a foot long, eight inches wide, and six high; or what other dimension you shall think fit, provided it does not greatly vary from these proportions.

On the inside of this box, and against each of its opposite ends A and B, place a mirror of the same size. Take off the quicksilver from the mirror that you place at B, for about an inch and an half, at the part C, where you are to make a hole in the box of the same size, by which you may easily view its inside. Cover the top of the box with a frame, in which must be placed a transparent glass, covered with gauze, on the side next the inner part of the box. Let there be two grooves at the parts E and F to receive the two painted scenes hereafter mentioned. On two pieces of cut pasteboard let there be skilfully painted on both sides (see fig. 8, and 9.) any subject you think proper; as woods, gardens, bowers, colonades, &c. and on two other pasteboards, the same subjects on one side only; observing that there ought to be on one of them some object relative to the subject placed at A, that the mirror placed at D may not reflect the hole at C on the opposite side.

Place the two boards painted on both sides in the grooves E and F; and those that are painted on one side only, against the opposite mirrors C and D; and then cover the box with its transparent top. This box should be placed in a strong light to have a good effect.

When the eye is placed at C, and views the objects on the inside of the box, of which some, as we have said, are painted on both sides, they are successively reflected from one mirror to the other; and if, for example, the painting consists of trees, they will appear like a very long vista, of which the eye cannot discern the end: for each of the mirrors repeating the objects, continually more faintly, contribute greatly to augment the illusion.

III. Take a square box ABCD, of about six inches long, and twelve high; cover the inside of it with four plane mirrors, which must be placed perpendicular to the bottom of the box CHFD.

Place certain objects in relief on the bottom of this box; suppose, for example, a piece of fortification, (as fig. 11.) with tents, soldiers, &c. or any other subject that you judge will produce an agreeable effect by its disposition when repeatedly reflected by the mirrors.

On the top of this box place a frame of glass, in form of the bottom part of a pyramid, whose base AGEB is equal to the size of the box: its top ILN, must form a square of six inches, and should not be more than four or five inches higher than the box. Cover the four sides of this frame with a gauze, that the inside may not be visible but at the top ILN, which should be covered with a transparent glass.

When

6
II. Appear-
ance of a
boundless
vista,
Plate lxxiii.
fig. 7.

7
III. Of a
fortification
of immense
extent,
fig. 10.

When you look into this box through the glafs ILN, the mirrors that are diametrically oppofite each other, mutually reflecting the figures inclofed, the eye beholds a boundlefs extent, completely covered with thefe objects; and if they are properly difpofed, the illufion will occafion no fmall furprize, and afford great entertainment.

Note, The nearer the opening ILN is to the top of the box, the greater will be the apparent extent of the fubject. The fame will happen if the four mirrors placed on the fides of the box be more elevated. The objects, by either of thefe difpofitions, will appear to be repeated nine, twenty-five, forty-nine times, &c. by taking always the fquare of the odd numbers of the arithmetical progreflion 3, 5, 7, 9, &c. as is very eafy to conceive, if we remember that the fubject inclofed in the box is always in the centre of a fquare, compofed of feveral others, equal to that which forms the bottom of the box.

Other pieces of the fame kind (that is viewed from above) may be contrived, in which mirrors may be placed perpendicular on a triangular, pentagon, or hexagon, (that is, a three, five, or fix-fided) plane. All thefe different difpofitions, properly directed, as well with regard to the choice as pofition of the objects, will confantly produce very remarkable and pleafing illufions.

If inftead of placing the mirrors perpendicular, they were to incline equally, fo as to form part of a reverfed pyramid, the fubject placed in the box would then have the appearance of a very extenfive globular or many-fided figure.

8
IV. Surprifing multiplication of objects, fig. 12.

IV. On the hexagonal or fix-fided plane ABCDEF draw fix femi-diameters GA, GB, GC, GD, GE, GF; and on each of thefe place perpendicularly, two plane mirrors, which muft join exactly at the center G*. Decorate the exterior boundary of this piece (which is at the extremity of the angles of the hexagon) with fix columns, that at the fame time ferve to fupport the mirrors, by grooves formed on their inner fides. (See the profile H) Add to thefe columns their entablatures, and cover the edifice in fuch manner as you fhall think proper.

In each one of thefe fix triangular fpaces, contained between two mirrors, place little figures of pafte-board, in relief, representing fuch objects as when feen in an hexagonal form will produce an agreeable effect. To thefe add fmall figures of enamel; and take particular care to conceal, by fome object that has relation to the fubject, the place where the mirrors join, which, as we have faid before, all meet in the common center G.

When you look into any one of the fix openings of this palace, the objects there contained being repeated fix times, will feem entirely to fill up the whole of the building. This illufion will appear very remarkable: efpecially if the objects made choice of are properly adapted to the effect that is to be produced by the mirrors.

Note, if you place between two of thefe mirrors part of a fortification, as a curtain and two demiba-

fions, you will fee an entire citadel, with its fix baftions. Or if you place part of a ball-room, ornamented with chandeliers and figures in enamel, all thefe objects being here multiplied, will afford a very pleafing profpect.

V. Within the cafe ABCD, place four mirrors, O, P, Q, R, fo difpofed that they may each of them make an angle of forty-five degrees, that is, that they may be half way inclined from the perpendicular, as in the figure. In each of the two extremities AB, make a circular overture, in one of which fix the tube GL, in the other the tube MP, and obferve that in each of thefe is to be inferted another tube, as H and I†.

Furnifh the firft of thefe tubes with an object-glafs at G, and a concave eye-glafs at F. You are to obferve, that in regulating the focus of thefe glaffes, with regard to the length of the tube, you are to fuppofe it equal to the line G, or vifual pointed ray, which entering at the overture G, is reflected by the four mirrors, and goes out at the other overture F, where the ocular glafs is placed. Put any glafs you will into the two ends of the moveable tubes H and I; and laftly place the machine on a ftand E, moveable at the point S, that it may be elevated or depreffed at pleafure.

When the eye is placed at F, and you look through the tube, the rays of light that proceed from the object T, paffing through the glafs G, are fucceffively reflected by the mirrors, O, P, Q, and R, to the eye at F, and there paint the object T, in its proper fituation, and thefe rays appear to proceed directly from that object.

The two moveable tubes H and I, at the extremities of each of which a glafs is placed, ferve only the more to difguife the illufion, for they have no communication with the interior part of the machine. This inftrument being moveable on the ftand E, may be directed to any object; and if furnifhed with proper glaffes will anfwer the purpofe of a common perfpective.

The two moveable tubes H and I being brought together, the machine is directed toward any object, and defiring a perfon to look in at the end F, you ask him if he fee diftinctly that object. You then feparate the two moveable tubes, and leaving a fpace between them fufficient to place your hand, or any other folid body, you tell him that the machine has the power of making objects vifible through the moft opaque body; and as a proof you defire him then to look at the fame object, when, to his great furprize, he will fee it as diftinct as when there was no folid body placed between the tubes.

Note, This experiment is the more extraordinary, as it is very difficult to conceive how the effect is produced. The two arms of the cafe appearing to be made to fupport the perfpective glafs; and to whatever object it is directed, the effect is ftill the fame.

VI. In the partition AB, make two overtures, CD, and EF, of a foot high, and ten inches wide, and

9
V. Opaque bodies feemingly rendered transparent, Plate lxxiii. fig. 1.

10
VI.VII. The magician's mirrors, about fig. 2.

* Thefe mirrors, placed back to back, muft be as thin as poffible.

† Thefe four tubes muft terminate in the fubftance of the cafe, and not enter the infide, that they may not hinder the effect of the mirrors.

about a foot distant from each other. Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame, like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees*: let them be both 18 inches square: let all the space between them be inclosed by boards or pasteboard, painted black, and well clofed, that no light may enter: let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

Note, There should be a sconce with a candle placed on each side of the two glasses in the waincot, to enlighten the faces of the persons who look in them, otherwise this experiment will have no remarkable effect.

This experiment may be considerably improved by placing the two glasses in the partition, in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty, and desire him to look in the glass, which he will naturally do; and on seeing a strange face he will draw back: but returning to it, and seeing another, another, and another, like the phantom kings in Macbeth, what his surprize will be is more easy to conceive than express. After this, a real mirror may be privately let down on the back of the glass; and if he can be prevailed to look in it once more, he will then, to his further astonishment, see his own face; and may be told, perhaps persuaded, that all he thought he saw before was mere imagination.

How many tricks, less artful than this, have passed in former times for sorcery; and pass at this time, in some countries, for apparitions?

Note, When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of eighty degrees (that is, one-ninth part from the perpendicular) he will then see all the parts of his face, except the nose and forehead. If it be inclined to sixty degrees (that is, one-third part) he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination; and when the glass comes to forty-five degrees, (that is, half way down) the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprize, as there is no method of concealing the cause by which they are produced.

Fig. 3. VII. Make a box of wood, of a cubical figure, ACBD, of about fifteen inches every way. Let it be fixed on the pedestal P, at the usual height of a man's

head. In each side of this box let there be an opening of an oval form, of ten inches high, and seven wide.

In this box place two mirrors A, D, with their backs against each other; let them cross the box in a diagonal line, and in a vertical position. Decorate the openings in the sides of this box with four oval frames and transparent glasses, and cover each of them with a curtain, so contrived that they may all draw up together.

Place four persons in front of the four sides, and at equal distances from the box, and then draw up the curtains that they may see themselves in the mirrors; when each of them, instead of his own figure, will see that of the person who is next him, and who, at the same time, will seem to him to be placed on the opposite side. Their confusion will be the greater, as it will be very difficult for them to discover the mirrors concealed in the box. The reason of this phenomenon is evident; for though the rays of light may be turned aside by a mirror, yet, as we have before said, they always appear to proceed in right lines.

VIII. Provide a box ABCD of about two feet long, twelve inches wide, and twelve inches high. At the end AC place a concave mirror, the focus of whose parallel rays is at eighteen inches from the reflecting surface. At IL place a pasteboard blacked, in which a hole is cut sufficiently large to see on the mirror H, the object placed at BEFD.

12
VIII. The perspective mirror; fig. 7.

Cover the top of the box, from A to I, close, that the mirror H may be entirely darkened. The other part IB, must be covered with a glass, under which is placed a gauze.

Make an aperture at G, near the top of the side E B; beneath which, on the inside, place, in succession, paintings of different subjects, as vistas, landscapes, &c. so that they may be in front of the mirror H. Let the box be so placed that the object may be strongly illumined be the sun, or by wax lights placed under the enclosed part of the box AL.

By this simple construction the objects placed at GD will be thrown into their natural perspective; and if the subjects be properly chosen, the appearance will be altogether as pleasing as in optical machines of a much more complicated form.

Note, A glass mirror should be always here used, as those of metal do not represent the objects with equal vivacity, and are beside subject to tarnish. It is also necessary that the box be sufficiently large, that you may not be obliged to use a mirror whose focus is too short; for in that case, the right lines near the border of the picture will appear bent in the mirror, which will have a disagreeable effect, and cannot be avoided.

IX. The rays of a luminous body placed in the focus of a concave mirror being reflected in parallel lines, if a second mirror be placed diametrically opposite the first, it will, by collecting those rays in its focus, set fire to a combustible body.

13
IX. To set fire to a combustible body by the reflection of two concave mirrors.

Place two concave mirrors, A and B (fig. 8.) at about twelve or fifteen feet distance from each other, and let the axis of each of them be in the same line. In the focus C, of one of them, place a live coal, and

in

* That is, half-way between a line drawn perpendicular to the ground and its surface.

in the focus D of the other, some gun-powder. With a pair of double bellows, which make a continual blast, keep constantly blowing the coal, and notwithstanding the distance between them the powder will presently take fire.

It is not necessary that these mirrors be of metal or brass, those made of wood or pasteboard, gilded, will produce the explosion, which has sometimes taken effect at the distance of fifty feet, when mirrors of eighteen inches, or two feet diameter, have been used.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

14
The real ap-
portion, fig. 9.

X. Behind the partition AB, place, in a position something oblique, the concave mirror EF, which must be at least ten inches in diameter, and its distance from the partition equal to three-fourths of the distance of its center.

In the partition make an opening of seven or eight inches, either square or circular: it must face the mirror, and be of the same height with it. Behind this partition place a strong light, so disposed that it may not be seen at the opening, and may illumine an object placed at C, without throwing any light on the mirror.

Beneath the aperture in the partition place the object C, that you intend shall appear on the outside of the partition, in an inverted position; and which we will suppose to be a flower. Before the partition, and beneath the aperture, place a little flower-pot D, the top of which should be even with the bottom of the aperture, that the eye, placed at G, may see the flower in the same position as if its stalk came out of the pot.

Take care to paint the space between the back part of the partition and the mirror black, to prevent any

reflections of light from being thrown on the mirror; in a word, so dispose the whole that it may be as little enlightened as possible.

When a person is placed at the point G, he will perceive the flower that is behind the partition, at the top of the pot at D, but on putting out his hand to pluck it, he will find that he attempts to grasp a shadow.

The phenomena that may be produced by means of concave mirrors are highly curious and astonishing. By their aid, spectres of various kinds may be exhibited. Suppose, for example, you were to tell any one, that at such an hour, and in such a place, he should see the apparition of an absent or deceased friend (of whose portrait you are in possession). In order to produce this phantom, instead of the hole in the partition AB, in the last figure, there must be a door, which opens into an apartment to which there is a considerable descent. Under that door you are to place the portrait, which must be inverted and strongly illuminated, that it may be lively reflected by the mirror, which must be large and well polished. Then having introduced the incredulous spectator at another door, and placed him in the proper point of view, you suddenly throw open the door at AB, when, to his great astonishment, he will immediately see the apparition of his friend.

It will be objected, perhaps, that this is not a perfect apparition, because it is only visible at one point of view, and by one person. But it should be remembered, that it was an established maxim in the last centuries, that a spectre might be visible to one person and not to others. So Shakspeare makes both Hamlet and Macbeth see apparitions that were not visible to others, present at the same time. It is not unlikely, moreover, that this maxim took its rise from certain apparitions of this kind that were raised by the monks, to serve some purposes they called religious: as they alone were in possession of what little learning there then was in the world.

C A T

CATOPTROMANCY, *Κατοπτρομαντεία*, a kind of divination among the ancients; so called, because consisting in the application of a mirror. The word is formed from *κατοπτρον*, *speculum*, "mirror," and *μαντεία*, *divinatio*, "divination." Pausanias says, it was in use among the Achæians; where those who were sick, and in danger of death, let down a mirror, or looking-glass, fastened by a thread, into a fountain before the temple of Ceres; then, looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death: on the contrary, if the flesh appeared fresh and healthy, it was a token of recovery. Sometimes glasses were used without water, and the images of things future represented in them. See GASTROMANCY.

CATROU (Francis), a famous Jesuit born at Paris in 1659. He was engaged for twelve years in the *Journal de Trevoux*, and applied himself at the same time to other works, which distinguished him among the learned. He wrote a general History of the Mogul empire, and a Roman history, in which he was

C A T

assisted by Father Rouille a brother Jesuit. Catrou died in 1737; and this last history was continued by Rouille, who died in 1740.

CATTI, a people of Germany, very widely spread; on the east reaching to the river Sala, on the north to Westphalia; occupying, besides, Hesse, the Wetterau, and part of the tract on the Rhine, and on the banks of the river Lohne. The Herzynian forest began and ended in their country.

CATTLE, a collective word, which signifies the fourfooted animals, which serve either for tilling the ground, or for food to men. They are distinguished into large, or black cattle; and into small cattle: of the former are horses, bulls, oxen, cows, and even calves and heifers; amongst the latter are rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm: they who deal in cattle are styled graziers.

CATTERTHUN, a remarkable Caledonian post, a few miles north of the town of Brechin in the county of Angus in Scotland. Mr Pennant describes it as uncommon

Catullus | **Catz.** uncommon strength. "It is (says he) of an oval form, made of a lustrous dike of loose white stones, whose convexity, from the bafe within to that without, is 122 feet. On the outside a hollow, made by the disposition of the stones, furrounds the whole. Round the bafe is a deep ditch, and below that about 100 yards, are vetiges of another, that went round the hill. The area within the stony mound is flat; the axis, or length of the oval, is 436 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the flicker of the possessors of the post: there is also a hollow, now almost filled with stones, the well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the *Brown Catterthun*, from the colour of the ramparts which are composed only of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rises a small rill, which, running down the hill, has formed a deep gully. From the side of the fortrefs is another rampart, which extends parallel to the rill, and then reverts, forming an additional post or retreat. The meaning of the word *Catter-thun* is *Camp-town*; and Mr Pennant thinks these might probably be the posts occupied by the Caledonians before their engagement at the foot of the Grampian Mountains with the celebrated Agricola. See (*History of*) SCOTLAND.

CATULLUS (Caius Valerius), a Latin poet, born at Verona, in the year of Rome 666. The harmony of his numbers acquired him the esteem and friendship of Cicero, and other great men of his time. Many of his poems, however, abound with gross obscenities. He wrote satirical verses against Cæsar, under the name of Marmoro. He spent his whole life in a state of poverty; and died in the flower of his age, and the height of his reputation. Joseph Scaliger, Pafferat, Muret, and Isaac Vossius, have written learned notes on this poet.

CATZ (James), a great civilian, politician, and Dutch poet, was born at Brouwerhaven, in Zealand, in the year 1577. After having made several voyages, he fixed at Middleburg; and acquired by his pleadings such reputation, that the city of Dort chose him for its peniary; as did also, some time after, that of Middleburg. In 1634, he was nominated peniary of Holland and West Friesland; and in 1648, he was elected keeper of the seal of the same state, and stadtholder of the sicks: but some time after, he resigned these employments, to enjoy the repose which his advanced age demanded. As the post of grand peniary had been fatal to almost all those who had enjoyed it, from the beginning of the republic till that time, Catz delivered up his charge on his knees, before the whole assembly of the states, weeping for joy, and thanking God for having preserved him from the inconveniences that seemed attached to the duties of that office. But though he was resolved to spend the rest of his days in repose, the love of his country engaged him to comply with the desires of the state, who importuned him to go on an embassy to England, in the delicate conjuncture in which the republic found itself during the protectorate of Cromwell. At his

return, he retired to his fine country seat at Sorgvliet, where he lived in tranquillity till the year 1660, in which he died. He wrote a great number of poems in Dutch; most of which are on moral subjects, and so esteemed, that they have been often printed in all the different sizes; and next to the Bible, there is no work so highly valued by the Dutch.

CATZENELLIBOGEN, a town of Germany, in the lower part of the upper circle of the Rhine, with a strong castle. It is capital of a county of the same name. E. Long. 7. 38. N. Lat. 50. 20.

CAVA, a considerable and populous town of Italy, in the kingdom of Naples, and in the Hither Principato, with a bishop's see. It is situated at the foot of Mount Metelian, in E. Long. 15. 5. N. Lat. 40. 40.

CAVAILLAN, a town of France in Contal Venaisin, with a bishop's see. It is situated on the river Durance, in a fertile and pleasant country. E. Long. 4. 17. N. Lat. 43. 52.

CAVALCANTE (Guido), a nobleman of Florence in the 13th century, who having followed the party of the Guelphs, experienced the changeableness of fortune. He shewed great strength of mind in his misfortunes, and never neglected to improve his talents. He wrote a treatise in Italian concerning style, and some verses which are esteemed. His poem on the love of this World, has been commented on by several learned men.

CAVALIER, a horseman, or person mounted on horseback; especially if he be armed withal, and have a military appearance.

Anciently, the word was restrained to a knight, or *miles*. The French still use *Chevalier* in the same sense.

CAVALIER, considered as a faction. See BRITAIN, n° 109.

CAVALIER, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a bastion, bordered with a parapet, and cut into more or less embrasures, according to the capacity of the cavalier. Cavaliers are a double defence for the faces of the opposite bastion: they defend the ditch, break the besiegers galleries, command the traverses in dry moats, scour the salient angle of the counterescarp, where the besiegers have their counter-batteries, and enfilade the enemies trenches, or oblige them to multiply their parallels: they are likewise very serviceable in defending the breach and the retrenchments of the besieged, and can very much incommode the entrenchments which the enemy make, being lodged in the bastion.

CAVALIER, in the menage, one that understands horses, and is practised in the art of riding them.

CAVALIERI (Bonaventure), an eminent mathematician in the 17th century, a native of Milan, and a friar of the order of the Jesuits of St Jerome, was professor of mathematics at Bologna, where he published several mathematical books, particularly the *Method of Indivisibles*. He was a scholar of Galileo. His *Directorium generale Uranometricum* contains great variety of most useful practices in trigonometry and astronomy. His trigonometrical tables in that work are excellent.

CAVALRY, a body of soldiers that charge on horseback. The word comes from the French, *cavalerie*,

Catzenelli-
bogen
|

Cavan
I
Caucasus.

valerie, and that from the corrupt Latin, *caballus*, a horse.

The Roman cavalry consisted wholly of those called *equites*, or knights, who were a distinct order in the distribution of citizens.—The Grecian cavalry were divided into *cataphractæ* and *non cataphractæ*, i. e. into heavy and light armed.—Of all the Greeks, the Thebians excelled most in cavalry. The Lacedæmonians, inhabiting a mountainous country, were but meanly furnished with cavalry, till, carrying their arms into other countries, they found great occasion for horses to support and cover their foot. The Athenian cavalry, for a considerable time, consisted only of 96 horsemen: after expelling the Persians out of Greece, they increased the number to 300; and afterwards to 1200, which was the highest pitch of the Athenian cavalry. The Turkish cavalry consists partly of Spahis, and partly of horsemen raised and maintained by the Zaims and Timariots.

The chief use of the cavalry is to make frequent excursions to disturb the enemy, intercept his convoys, and destroy the country: in battle to support and cover the foot, and to break through and disorder the enemy; also to secure the retreat of the foot. Formerly, the manner of the fighting of the cavalry was, after firing their pistols or carabines to wheel off, to give opportunity for loading again. Gustavus Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridlehand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

CAVAN, a town of Ireland, and capital of a county of the same name, in the province of Ulster, situated in W. Long. 7. 32. N. Lat. 5. 04.

CAVAN, a county of Ireland, 47 miles in length, and 23 in breadth; is bounded on the east by Monaghan, and on the south by Longford, West-Meath, and East-meath. It has but two towns of any note, viz. Cavan and Kilmore. It sends five members to parliament; two for the county, two for Cavan, and one for Kilmore. It contains upwards of 8000 houses, 37 parishes, seven baronies, and two boroughs.

CAUCASUS, the name of a very high mountain of Asia, being one of that great ridge which runs between the Black and Caspian seas. Sir John Chardin describes this as the highest mountain, and the most difficult to pass, of any he had seen. It has frightful precipices, and in many places the roads are cut out of the solid rock. At the time he passed it, the mountain was entirely covered with snow; so that, in many places, his guides behaved to clear the way with hoes. The mountain is 36 leagues over, and the summit of it eight leagues in breadth. The top is perpetually covered with snow; and our traveller relates, that the two last days he seemed to be in the clouds, and was not able to see 20 paces before him. Excepting the very top, however, all the parts of Mount Caucasus are extremely fruitful; abounding in honey, corn, fruits, hogs, and large cattle. The vines twine about the trees, and rise so high, that the inhabitants cannot gather the fruit from the uppermost branches. There are many streams of excellent water, and a

vast number of villages. The inhabitants are for the most part Christians of the Georgian Church. They have fine complexions, and the women are very beautiful.—In the winter they wear snow-shoes in the form of rackets, which prevent their sinking in the snow, and enable them to run upon it with great swiftness.

CAUCI. See CHAUCI.

CAUDEBEC, a rich, populous, and trading town in Normandy, and capital of the territory of Caux. It is seated at the foot of a mountain near the river Seine, in E. Long. o. 46. N. Lat. 40. 30.

CAUDEX, by Malpighi and other botanists, is used to signify the stem or trunk of a tree: by Linnæus, the stock or body of the root, part of which ascends, part descends. The ascending part raises itself gradually above ground, serving frequently for a trunk, and corresponds in some measure to the *caudex* of former writers: the descending part strikes gradually downward into the ground, and puts forth radicles or small fibres, which are the principal and essential part of every root*. The descending caudex therefore corresponds to the radix of other botanists. Agreeably to this idea, Linnæus considers trees and shrubs as roots above ground; an opinion which is confirmed by a well known fact, that trees when inverted, put forth leaves from the descending caudex, and radicles or roots from the ascending. For the varieties in the descending caudex, see the article RADIX.

CAVE, any large subterraneous hollow. These were undoubtedly the primitive habitations, before men began to build edifices above ground. The primitive method of burial was also to reposit the bodies in caves, which seems to have been the origin of catacombs*. They long continued the proper habitations of shepherds. Among the Romans, *cavæ*, (*antra*), used to be consecrated to nymphs, who were worshipped in caves, as other gods were in temples. The Persians also worshipped their god Mithras in a natural cave consecrated for the purpose by Zoroaster. The cave of the nymph Egeria is still shewn at Rome. Kircher, after Gaffarellos, enumerates divers species of caves; as divine, natural, &c.—Of natural caves some are possessed of a medicinal virtue, as the Grotto de Serpente; others are poisonous or metaphysical; some are replete with metalline exhalations, and others with waters. Divine caves were those said to affect the human mind and passions in various ways, and ever to inspire with a knowledge of future events. Such were the sacred caverns at Delphi which inspired the Pythia; the Sibyl's cave at Cumæ, still shewn near the lake Avernus; the cave of Trophœus, &c.

CAVE (Dr William), a learned English divine, born in 1637, educated in St John's college Cambridge; and successively minister of Hasely in Oxfordshire, Allhallows the Great in London, and of Ilfington. He became chaplain to Charles II. and in 1684 was installed a canon of Windsor. He compiled the *Lives of the Primitive Fathers in the three first centuries of the church*, which is esteemed a very useful work; and *Historia Literaria*, &c. in which he gives an exact account of all who had writ for or against Christianity,

Caveare
|
Cavendish.

anity, from the time of Christ to the 14th century: which works produced a warm controversy between Dr Cave and M. Le Clerc, who was then writing his *Bibliothèque Universelle* in Holland, and who charged the doctor with partiality. Dr Cave died in 1713.

CAVEARE, CAVEER, or CAVIARY, a kind of food lately introduced into Britain. It is made of the hard roes of flurgeon *, formed into small cakes, about an inch thick and three or four inches broad. The method of making it, is by taking out of the spawn all the nerves or strings, then washing it in white-wine or vinegar, and spreading it on a table. It is then salted and pressed in a fine bag; after which it is cased up in a vessel with a hole at the bottom, that if any moisture is left it may run out. This kind of food is in great request among the Moscovites, on account of their three lenis, which they keep with a superstitious exactness; wherefore the Italians settled at Moscow drive a very great trade in this commodity throughout that empire, there being a prodigious quantity of flurgeon taken at the mouth of the Wolga and other rivers which fall into the Caspian sea. A pretty large quantity of the commodity is also consumed in Italy and France. They get the caveare from Archangel, but commonly buy it at second hand of the English and Dutch.—According to Savary, the best caveare brought from Muscovy is prepared from the belluga, a fish eight or ten feet long, caught in the Caspian sea, which is much preferable to that made of the spawn of flurgeon. A kind of caveare, or rather sausage, is also made from the spawn of some other fishes; particularly of roe of mullet caught in the Mediterranean. See MUGIL, and BOTARGO.

CAVEAT, in law, a kind of process in the spiritual courts, to stop the proving of a will, the granting tithes of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

CAVEATING, in fencing, is the shifting the sword from one side of that of your adversary to the other.

CAVEDO, in commerce, a Portuguese long measure, equal to 27 $\frac{3}{4}$ English inches.

CAVENDISH (Thomas), of Suffolk, the second Englishman that sailed round the globe, was descended from a noble family in Devonshire. Having dissipated his fortune, he resolved to repair it at the expense of the Spaniards. He sailed from Plymouth with two small ships in July 1586; passed through the straits of Magellan; took many rich prizes along the coasts of Chili and Peru; and near California possessed himself of the St Ann, an Acapulco ship, with a cargo of immense value. He completed the circumnavigation of the globe, by returning home round the Cape of Good Hope, and reached Plymouth again in September 1588. On his arrival, it is said, that his soldiers and sailors were clothed in silk, his sails were damask, and his topmasts were covered with cloth of gold. His acquired riches did not last long: he reduced himself, in 1591, to the expedient of another voyage; which was far from being so successful as the former; he went no farther than the straits of Magellan, where the weather obliging him to return, he died of grief on the coast of Brazil.

Cavendish.

CAVENDISH (Sir William), descended of an ancient and honourable family, was born about the year 1505, the second son of Thomas Cavendish, of Cavendish in Suffolk, clerk of the pipe in the reign of Henry VIII. Having had a liberal education, he was taken into the family of the great cardinal Woolley, whom he served in the capacity of gentleman-usher of the chamber, when that superb prelate maintained the dignity of a prince. In 1527 he attended his master on his splendid embassy to France, returned with him to England, and was one of the few who continued faithful to him in his disgrace. Mr Cavendish was with him when he died, and delayed going to court till he had performed the last duty of a faithful servant by seeing his body decently interred. The king was so far from disapproving of his conduct, that he immediately took him into his household, made him treasurer of his chamber, a privy counsellor, and afterwards conferred on him the order of knighthood. He was also appointed one of the commissioners for taking the surrender of religious houses. In 1540 he was nominated one of the auditors of the court of augmentations, and soon after obtained a grant of several considerable lordships in Hertfordshire. In the reign of Edward VI. his estates were much increased by royal grants in seven different counties; and he appears to have continued in high favour at court during the reign of queen Mary. He died in the year 1557. He was the founder of Chatworth, and ancestor of the dukes of Devonshire. He wrote "The life and death of cardinal Woolley;" printed at London 1667; reprinted in 1706, under the title of "Memoirs of the great favourite cardinal Woolley."

CAVENDISH (William), duke of Newcastle, grandson of Sir William Cavendish, was born in 1592. In 1610, he was made knight of the bath; in 1620, raised to the dignity of a peer, by the title of baron Ogle, and viscount Mansfield; and in the third year of king Charles I. created earl of Newcastle upon Tyne, and baron Cavendish of Boleover. He was after this made governor to the prince of Wales, afterwards Charles II. When the first troubles broke out in Scotland, and the king's treasury was but indifferently provided, he contributed ten thousand pounds; and also raised a troop of horse, consisting of about two hundred knights and gentlemen, who served at their own charge, were commanded by the earl, and honoured with the title of "the prince's troop." He had after this the command of the northern counties; and was constituted general and commander in chief of all the forces that might be raised north of Trent, and of several counties south of that river. He afterwards raised an army of eight thousand horse, foot, and dragoons; with which he took some towns, and gained several important victories. On this, he was advanced to the dignity of marquis of Newcastle; but his majesty's affairs being totally ruined by the rashness of prince Rupert, he, with a few of the principal officers of the army, went abroad, and staid for some time at Paris; where, notwithstanding the vast estate he had when the civil war broke out, his circumstances were now so bad, that himself and wife were reduced to the necessity of pawning their cloaths for a dinner. He afterwards removed to Antwerp, that

* See Acci-
perfer.

Cavendish, that he might be nearer his own country; and there, though under great difficulties, resided for several years: but, notwithstanding his distresses, he was treated, during an exile of eighteen years, with extraordinary marks of distinction. On his return to England at the restoration, he was advanced to the dignity of earl of Ogle and duke of Newcastle. He spent his time in a country retirement, and was the patron of men of merit. His grace died in 1679, aged 84. He wrote a treatise on horsemanship, which is esteemed; and some comedies, which are not.

Mr Granger observes, that he was master of many accomplishments, and was much better qualified for a court than a camp: that he understood horsemanship, music, and poetry; but was a better horseman than musician, and a better musician than poet.

CAVENDISH (Margaret), duchess of Newcastle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngest sister of Lord Lucas of Colchester. She married the duke of Newcastle abroad in 1645; and on their return after the restoration, spent the remainder of her life in writing plays, poems, with the life of her husband, to the amount of about a dozen of folios. "What gives the best idea of her unbounded passion for scribbling, (says Mr Walpole), was her seldom revising the copies of her works, lest, as she said, it should disturb her following conceptions." She died in 1673.

CAVENDISH (William), the first duke of Devonshire, and one of the most distinguished patriots in the British annals, was born in 1640. In 1677, being then member for Derby, he vigorously opposed the venal measures of the court; and, the following year, was one of the committee appointed to draw up articles of impeachment against the lord treasurer Danby. In 1679, being re-elected to serve for Derby in a new parliament, Charles II. thought fit to make him a privy counsellor; but he soon withdrew from the board, with his friend lord Russell, when he found that popish interest prevailed. He carried up the articles of impeachment to the house of lords, against lord chief justice Scroggs, for his arbitrary and illegal proceedings in the court of king's bench; and when the king declared his resolution not to sign the bill for excluding the Duke of York (afterwards James II.), he moved the house of commons, that a bill might be brought in for the association of all his majesty's protestant subjects. He also openly named the king's evil counsellors, and voted for an address to remove them from his presence and councils for ever. He nobly appeared at lord Russell's trial, in defence of that great man, at a time when it was scarce more criminal to be an accomplice than a witness for him. The same fortitude, activity, and love of his country, animated this illustrious patriot to oppose the arbitrary proceedings of James II.; and when he saw there was no other method of saving the nation from impending slavery, he was the foremost in the association for inviting over the prince of Orange, and the first nobleman who appeared in arms to receive him at his landing. His last public service, was in the union with Scotland, for concluding of which he was appointed a commissioner by queen Anne. He died in

1707, and ordered the following inscription to be put on his monument.

*Willielmus Dux Devon,
Bonorum Principum Fidelis Subditus,
Inimicus et Invidiosus Tyrannus.
William Duke of Devonshire,
Of good Princes the faithful Subject,
The Enemy and Averion of Tyrants.*

Besides being thus estimable for public virtues, his grace was distinguished by his literary accomplishments. He had a poetical genius, which flew itself particularly in two pieces, written with equal spirit, dignity, and delicacy: these are, an ode on the death of queen Mary; and an allusion to the archbishop of Cambray's supplement to Homer. He had great knowledge in the languages, was a true judge in history, and a critic in poetry; he had a fine hand in music, an elegant taste in painting, and in architecture had a skill equal to any person of the age in which he lived.

CAVETTO, in architecture, a hollow member, or round concave moulding, containing a quadrant of a circle, and having a quite contrary effect to that of a quarter round: it is used as an ornament in cornices.

CAVEZON, in the menage, a sort of nose-band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, clapt upon the nose of a horse to wring it, and so forward the suppling and breaking of the horse.

CAVIARE. See **CAVEARE**.

CAUK, or **CAWK**, a white, very dense substance, resembling spar, but not soluble in acids, though fusible by fire. It is generally found in or near lead mines. It hath a singular effect upon antimony in fusion. See **CHEMISTRY**, n° 453.

CAUKING, or **CAULKING**, of a Ship, is driving a quantity of oakum, or old ropes untwisted and drawn alunder, into the seams of the planks, or into the intervals where the planks are joined together in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven very hard into these seams, it is covered with hot melted pitch or rosin, to keep the water from rotting it.

Among the ancients, the first who made use of pitch in caulking, were the inhabitants of Phœacia, afterwards called Corsica. Wax and rosin appear to have been commonly used previous to that period; and the Poles at this time use a sort of unctuous clay for the same purpose, on their navigable rivers.

CAULKING-Irons, are iron chisels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are stopped with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

CAUL, in anatomy, a membrane in the abdomen, covering the greatest part of the guts; called, from its structure, *Reticulum*, but most frequently *Omentum*. See **ANATOMY**, n° 351.

CAUL is likewise a little membrane, found on some children, encompassing the head when born.

Drelncourt takes the *caul* to be only a fragment of the membranes of the fœtus; which ordinarily break at the birth of the child. Lampridius tells us, that the midwives fold this *caul* at a good price to the advocates and pleaders of his time; it being an opinion,

Cauliflowers

Causes.

that while they had this about them, they should carry with them a force of persuasion which no judge could withstand : the canons forbid the use of it ; because some witches and forcerers, it seems, had abused it.

CAULIFLOWERS, in gardening, a much esteemed species of cabbage. See **BRASSICA**.

CAURSINES, (*Caursini*), were Italians that came into England about the year 1235, terming themselves *the Pope's merchants*, but driving no other trade than letting out money ; and having great banks in England, they differed little from Jews, save (as history says) they were rather more merciful to their debtors. Some will have them called *Courseins*, quasi *Causa Ursini*, bearish and cruel in their causes; others *Caorsini* or *Corsini*, as coming from the isle of Corsica : but Cowel says, they have their name from *Caorsium*, *Caorfi*, a town in Lombardy, where they first practised their arts of usury and extortion ; from whence, spreading themselves, they carried their infamous trade through most parts of Europe, and were a common plague to every nation where they came. The then bishop of London excommunicated them ; and king Henry III. banished them from this kingdom in the year 1240. But, being the Pope's solicitors and money-changers, they were permitted to return in the year 1250 ; though in a very short time they were again driven out of the kingdom on account of their intolerable exactions.

CAUSA MATRIMONII PRÆLOCUTI, in common law, a writ that lies where a woman gives land to a man in fee to the intent he shall marry her, and he refuses to do it in a reasonable time, being thereunto required by the woman : and in such case, for not performing the condition, the entry of the woman into the lands again has been adjudged lawful.

The husband and wife may sue this writ against another who ought to have married her.

CAUSALITY, among metaphysicians, the action or power of a cause in producing its effect.

CAUSALTY, among miners, denotes the lighter, sulphureous, earthy parts of ores, carried off in the operation of washing. This, in the mines, they throw in heaps upon banks, which in six or seven years they find it worth their while to work over again.

CAUSE, that from whence any thing proceeds, or by virtue of which any thing is done : it stands opposed to effect. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produces, is the cause ; and that which is produced, the effect : thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

First CAUSE, that which acts of itself, and of its own proper power or virtue : God is the only first cause in this sense.

Second CAUSES are those which derive the power and faculty of action from a first cause.

Efficient CAUSES are the agents employed in the production of any thing.

Material CAUSES, the subjects whereon the agents work ; or the materials whereof the thing is produced.

Final CAUSES are the motives inducing an agent to act, or the design and purpose for which the thing was done.

Physical CAUSE, that which produces a sensible corporal effect ; as the sun is the physical cause of light.

Moral CAUSE, that which produces a real effect, but in things immaterial : as repentance is the cause of forgiveness. A moral cause is also defined, That which determines us, though not necessarily, to do, or not to do, any thing ; as advice, intreaties, commands, menaces, &c.

It is to be observed, that, in this sense, a moral cause is only applicable to a free intelligent agent : it is also observable, that the latter notion of a physical as well as a moral cause is the most just, clear, and distinct.

CAUSE, among civilians, the same with action. See **ACTION**.

CAUSE, among physicians. The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed the disorder immediately ceases. The doctrine of the causes of diseases is called **ÆTIOLOGY**.

Physicians divide causes into procaccatic, antecedent, and continent.

Procaccatic CAUSE, *αντια προκατακτιν*, called also *primitive* and *incipient cause*, is either an occasion which of its own nature does not beget a disease, but, happening on a body inclined to diseases, breeds a fever, gout, &c. (such as are watching, fasting, and the like) ; or an evident and manifest cause, which immediately produces the disease, as being sufficient thereto, such as is a sword in respect of a wound.

Antecedent CAUSE, *αντια προγονικη*, a latent disposition of the body, from whence some disease may arise ; such as a plethora in respect of a fever, a cachymia in respect of a scurvy.

Continent, Conjunct, or Proximate CAUSE, that principle in the body, which immediately adheres to the disease, and which being present, the disease is also present ; or, which being removed, the disease is taken away : such is the stone in a nephritic patient.

CAUSEWAY, or **CAUSEY**, a massive construction of stone, flakes, and fascines ; or an elevation of fat, viscons earth, well beaten ; serving either as a road in wet marshy places, or as a mole to retain the waters of a pond, or prevent a river from overflowing the lower grounds. See **ROAD**. The word comes from the French *Chaussee*, anciently wrote *Chaussee* ; and that from the Latin *Calceata*, or *Calcata* ; according to Somner and Spelman, *à calcando*. Bergier rather takes the word to have had its rise *à peditum calceis, quibus teruntur*. Some derive it from the Latin *calx*, or French *chaux*, as supposing it primarily to denote a way paved with chalk-stones.

CAUSEWAY, *calcetum*, or *calcea*, more usually denotes a common hard raised way, maintained and repaired with stones and rubbish.

Devil's CAUSEWAY, a famous work of this kind, which ranges through the county of Northumberland, commonly supposed to be Roman, though Mr Horley suspects it to be of later times.

Causes

Causeway.

Causeway
|
Causticity.

GIANT'S CAUSEWAY, is a denomination given to a huge pile of stony columns in the district of Coleraine in Ireland. See *GIANT'S Causeway*.

CAUSSIN (Nicholas), furnished the *Just*, a French Jesuit, was born at Troyes in Champagne, in the year 1580; and entered into the Jesuits order when he was 26 years of age. He taught rhetoric in several of their colleges, and afterwards began to preach, by which he gained very great reputation. He increased this reputation by publishing books, and in time was preferred to be confessor to the king. But he did not discharge this office to the satisfaction of Cardinal Richelieu, though he discharged it to the satisfaction of every honest man; and therefore, it is not to be wondered at, that he came at length to be removed. He died in the Jesuits convent at Paris in 1651. None of his works did him more honour than that which he entitled *Le Cour Sainte*. It has been printed a great many times, and translated into Latin, Italian, Spanish, Portuguese, German, and English. He published several other books both in Latin and French.

CAUSTICITY, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is proscribed by prudent physicians. Several others, as nitrous acid, lapis infernalis or lunar caustic, common caustic, butter of antimony, are daily and successfully used to consume fungous flesh, to open ulcers, &c. They succeed very well when properly employed, and skilfully managed.

The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid, matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quick-lime; because this substance deprives them of much fat and inflammable matter, which binds and restrains the action of their saline principle. By this treatment, then, the saline principle is more disengaged, and rendered more capable of action. Also all combinations of metallic matters with acids form salts more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstance is necessary to constitute the causticity of these saline metalline matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in *corrosive sublimate*, although the sublimate shall be dissolved in so much water that its causticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters with which the acid is united: and this opinion is very probable, seeing its causticity is nothing but its

dissolving power, or its disposition to combine with other bodies; and this disposition is nothing else than attraction, which is one and the same thing as weight or gravitation.

CAUSTICS, in physic, an appellation given to medicines of so hot and fiery a nature, that, being applied, consume, and as it were burn, the texture of the parts, like hot iron.

Cautics are generally divided into four sorts; the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See *PHARMACY*, n^o 649. 791; and *CHEMISTRY*, n^o 196.

CAUSTIC Curve, in the higher geometry, a curve formed by the concurrence or coincidence of the rays of light reflected from some other curve.

CAUSUS, or *BURNING FEVER*, a species of continual fever, accompanied with a remarkable inflammation of the blood.

CAUTERIZATION, the act of burning or searing some morbid part, by the application of fire either actual or potential. In some places they cauterize with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver; Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied through a capsula, to prevent any terror from the sight of it. This method was invented by Placentinus, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaster, or lint moistened in oxyerate. Sometimes the hot iron is transmitted through a copper cannula, for the greater safety of the adjoining parts. The degrees and manners of cauterizing are varied according to the nature of the disease, and the part affected.

CAUTERY, in surgery, a medicine for burning, eating, or corroding any solid part of the body.

Cauteries are distinguished into two classes; actual and potential: by actual cauteries are understood red hot instruments, usually of iron; and by potential cauteries are understood certain kinds of corroding medicines. See *PHARMACY*, n^o 648.

CAUTION, in the civil and Scots law, denotes much the same with what, in the law of England, is called *BAIL*.

CAUTIONER, in Scots law, that person who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of caution, see *LAW*, Part III. n^o cxxxv. 19.

CAWK. See *CAWK*.

CAXA, a little coin made of lead mixed with some scoria of copper, struck in China, but current chiefly at Bantam in the island of Java, and some of the neighbouring islands. See (the *Table* subjoined to) *MONEY*.

CAXAMALCA, the name of a town and district of Peru in South America, where there was a most sumptuous palace belonging to the Incas, and a magnificent temple dedicated to the sun.

CAXTON (William) a mercer of London, emi-

Cayenne.

nent by the works he published, and for being *reputed* the first who introduced and practised the art of printing in England: as to which, see (*the History of*) PRINTING.

CAYENNE, a rich town and island of South America, and capital of the French settlements there, is bounded on the north by the Dutch colonies of Surinam, and situated in W. Long. 53. 10. N. Lat. 50.

This settlement was begun in 1635. A report had prevailed for some time before, that, in the interior parts of Guiana, there was a country known by the name of *del Dorado*, which contained immense riches in gold and precious stones; more than ever Cortez and Pizarro had found in Mexico and Peru; and this fable had fired the imagination of every nation in Europe. It is supposed that this was the country in quest of which Sir Walter Raleigh went on his last voyage; and, as the French were not behind their neighbours in their endeavours to find out so desirable a country, some attempts, for this purpose, were likewise made by that nation much about the same time; which at last coming to nothing, the adventurers took up their residence on the island of Cayenne. In 1643, some merchants of Rouen united their stock, with a design to support the new colony; but, committing their affairs to one Poncet de Bretigny, a man of a ferocious disposition, he declared war both against the colonists and savages, in consequence of which he was soon massacred. This catastrophe entirely extinguished the ardour of these associates; and in 1651 a new company was established. This promised to be much more considerable than the former; and they set out with such a capital as enabled them to collect 700 or 800 colonists in the city of Paris itself. These embarked on the Seine, in order to fall down to Havre de Grace; but unfortunately, the Abbé de Marivault, a man of great virtue, and the principal promoter of the undertaking, was drowned as he was stepping into his boat. Another gentleman, who was to have acted as general, was assassinated on his passage; and 12 of the principal adventurers, who had promised to put the colony into a flourishing situation, not only were the principal perpetrators of this fact, but uniformly behaved in the same atrocious manner. At last they hanged one of their own number; two died; three were banished to a desert island; and the rest abandoned themselves to every kind of excess. The commandant of the citadel deserted to the Dutch with part of his garrison. The savages, roused by numberless provocations, fell upon the remainder, so that the few who were left thought themselves happy in escaping to the Leeward Islands in a boat and two canoes, abandoning the fort, ammunition, arms, and merchandise, fifteen months after they had landed on the island.

In 1663, a new company was formed, whose capital amounted only to L. 8750. By the assistance of the ministry they expelled the Dutch, who had taken possession of the island, and settled themselves much more comfortably than their predecessors. In 1667 the island was taken by the English, and in 1676 by the Dutch; but afterwards restored to the French; and since that time it has never been attacked. Soon after some pirates, laden with the spoils they

had gathered in the South Seas, came and fixed their residence at Cayenne; refusing to employ the treasures they had acquired in the cultivation of the lands. In 1688, Ducasse, an able seaman, arrived with some ships from France, and propoed to them the plundering of Surinam. This proposal exciting their natural turn for plunder, the pirates betook themselves to their old trade, and almost all the rest followed their example. The expedition, however, proved unfortunate. Many of the assailants were killed, and all the rest taken prisoners and sent to the Caribbee Islands. This loss the colony has never yet recovered.

The island of Cayenne is about 16 leagues in circumference, and is only parted from the continent by two rivers. By a particular formation, uncommon in islands, the land is highest near the water side, and low in the middle. Hence the land is so full of morasses, that all communication between the different parts of it is impossible, without taking a great circuit. There are some small tracts of an excellent soil to be found here and there; but the generality is dry, sandy, and soon exhausted. The only town in the colony is defended by a covert way, a large ditch, a very good mud rampart, and five battions. In the middle of the town is a pretty considerable eminence, of which a redoubt has been made that is called the *fort*. The entrance into the harbour is through a narrow channel; and ships can only get in at high water through the rocks and reefs that are scattered about this pass.

The first produce of Cayenne was the arnotto; from the produce of which, the colonists proceeded to that of cotton, indigo, and lastly sugar. It was the first of all the French colonies that attempted to cultivate coffee. The coffee-tree was brought from Surinam in 1721, by some deserters from Cayenne, who purchased their pardon by so doing. Ten or twelve years after, they planted cocoa. In the year 1752, there were exported from Cayenne, 260,541 pounds of arnotto, 80,363 pounds of sugar, 17,919 pounds of cotton, 26,881 pounds of coffee, 91,916 pounds of cocoa, 618 trees for timber, and 104 planks.

CAYLUS (Count de), Marquis de Sternay, Baron de Branae, was born at Paris in 1692. He was the eldest of the two sons of John Count de Caylus, lieutenant-general of the armies of the king of France, and of the Marchioness de Villete. The count and countess, his father and mother, were very careful of the education of their son. The former instructed him in the profession of arms, and in bodily exercises: the latter watched over and fostered the virtues of his mind; and this delicate task she discharged with singular success. The countess was the niece of Madam de Maintenon, and was remarkable both for the solidity of her understanding and the charms of her wit. She was the author of that agreeable book intitled, "The Recollections of Madam de Caylus," of which Voltaire lately published an elegant edition. The amiable qualities of the mother appeared in the son; but they appeared with a bold and military air. In his natural temper he was gay and sprightly, had a taste for pleasure, a strong passion for independence, and an invincible aversion to the servitude of a court. Such were the instructors of the

Count

Cayenne
Caylus.

Count de Caylus. He was only twelve years of age when his father died at Brussels in 1704. After finishing his exercises, he entered into the corps of the *Mousquetaires*; and in his first campaign in the year 1709, he distinguished himself by his valour in such a manner, that Lewis XIV. commended him before all the court, and rewarded him with an ensigncy in the *Gendarmes*. In 1711 he commanded a regiment of dragoons, which was called by his own name; and he signalized himself at the head of it in Catalonia. In 1713, he was at the siege of Frébourg, where he was exposed to imminent danger in the bloody attack of the covered way. The peace of Rastade having left him in a state of inactivity ill-suited to his natural temper, his vivacity soon carried him to travel into Italy; and his curiosity was greatly excited by the wonders of that country, where antiquity is still fruitful, and produces so many objects to improve taste and to excite admiration. The eyes of the count were not yet learned; but he was struck with the sight of so many beauties, and soon became acquainted with them. After a year's absence, he returned to Paris with so strong a passion for travelling, and for antiquities, as induced him to quit the army.

He had no sooner quitted the service of Lewis, than he sought for an opportunity to set out for the Levant. When he arrived at Smyrna, he visited the ruins of Ephesus. From the Levant he was recalled in February 1717 by the tenderness of his mother. From that time he left not France, but to make two excursions to London. The academy of painting and sculpture adopted him as an honorary member in the year 1731; and the count, who loved to realize titles, spared neither his labour, nor his credit, nor his fortune, to instruct, assist, and animate the artists. He wrote the lives of the most celebrated painters and engravers that have done honour to this illustrious academy; and, in order to extend the limits of the art, which seemed to him to move in too narrow a circle, he collected, in three different works, new subjects for the painter, which he had met with in the works of the ancients.

Such was his passion for antiquity, that he wished to have had it in his power to bring the whole of it to life again. He saw with regret, that the works of the ancient painters, which have been discovered in our times, are effaced and destroyed almost as soon as they are drawn from the subterraneous mansions where they were buried. A fortunate accident furnished him with the means of shewing us the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expense. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and a precision that are inimitable: we see the liveliness and the freshness of the colouring that charmed the Cæsars. There were only 30 copies published; and there is no reason to expect that there will hereafter be any more.

Count de Caylus was engaged at the same time in

an enterprize still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which Count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister; and so much had he this enterprize at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742, Count Caylus was admitted honorary member of the academy of belles lettres; and then it was that he seemed to have found the place for which nature designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny's, but too concise a one to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Magault, a physician in Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practised by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published above 40 dissertations in the memoirs of the academy of belles lettres. The artists he was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the ablest of them have sometimes done, he founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copperplates.

The strength of his constitution seemed to give him hopes of a long life: but a humour settling in one of his legs, which entirely destroyed his health, he expired on the 5th of September 1765, and by his death his family is extinct. The tomb erected to the honour of Count Caylus is to be seen in the chapel of St Germain-l'Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had destined it to grace the place of his interment. While he availed the fatal hour, he placed it in his garden,

garden, where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society, he had all the frankness of a soldier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor, by sending them with a piece of money to get change for him. In these cases, he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and give them double the sum. He said frequently to his friends, "I have this day lost a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity."

CAZEROM, or CAZERON, a city of Asia in Persia, situated in E. Long. 70. N. Lat. 29. 15.

CAZIC, or CAZIQUE, a title given by the Spaniards to the petty kings, princes, and chiefs, of the several countries of America, excepting those of Peru, which are called *curacas*. The French call them *caïques*, a denomination which they always give to the Tartarian hords.—The cazics, in some places, do the office of physicians, and in others of priests, as well as of captains. The dignity of cazic among the Chittes, a people of South America, does not descend to children, but must be acquired by valour and merit. One of the prerogatives annexed to it is, that the cazic may have three wives, while the other people are allowed only one. Mexico comprehended a great number of provinces and islands, which were governed by lords called *caziques*, dependent on and tributary to the emperor. Thirty of these vassals are said to have been so powerful, that they were able, each of them, to bring an army of 100,000 men into the field.

CAZIMIR, a handsome town of Poland, in the palatinate of Lublin, situated on a hill covered with trees, in E. Long. 3. 10. N. Lat. 51. 5.

CEANOTHUS, NEW-JERSEY TEA; a genus of the monogynia order, belonging to the pentandria class of plants. There are three species, of which the most remarkable is the Americanus, a native of most parts of North America, from whence great plenty of the seeds have been imported into Europe. In England, this plant seldom rises more than four or five feet high, sending out branches on every side from the ground upward. They are garnished with oval pointed leaves, having three longitudinal veins running from the footstalk to the point. The leaves are placed opposite, and are of a light green colour. At the extremity of each shoot, the flowers are produced in close thick spikes, which are composed of five small leaves, and are of a clear white; and every shoot is terminated by one of these spikes, so that the whole shoot is covered over with flowers. When the autumn proves mild, these shrubs often flower again in October. In warm seasons, the seeds will ripen pretty well in England. But the shrub is best propagated by laying down the young branches, which, in a light soil, will put

out roots in a year's time; but they must not be much watered, otherwise they will rot.

CEBES, of Thebes, a celebrated Socratic philosopher, author of the admired *Table of Cebes*; or "Dialogues on the life, birth, and death of Mankind." He flourished about 405 years before Christ.

CECIL (William), Lord Burleigh, treasurer of England in the reign of queen Elizabeth, was the son of Richard Cecil, Esq; master of the robes to king Henry VIII. He was born in the house of his grandfather, David Cecil, Esq; at Bourn in Lincolnshire, in the year 1520; and received the rudiments of his education in the grammar-school at Grantham. From thence he was removed to Stamford; and about the year 1535, was entered of St John's College, Cambridge. Here he began his studies with a degree of enthusiastic application very uncommon in young gentlemen of family. At the age of 16 he read a sophistry lecture, and at 19 a voluntary Greek lecture, which was the more extraordinary as being at a time when the Greek language was by no means universally understood. In 1541 he went to London, and became a member of the society of Gray's-Inn, with an intention to study the law; but he had not been long in that situation, before an accident introduced him to king Henry, and gave a new bias to his pursuits. O'Neil, a famous Irish chief coming to court, had brought with him two Irish chaplains, violent bigots to the Romish faith; with these Mr Cecil, visiting his father, happened to have a warm dispute in Latin, in which he displayed uncommon abilities. The king, being informed of it, ordered the young man into his presence, and was so pleased with his conversation, that he commanded his father to find a place for him. He accordingly requested the reversion of the *custos breuium*, which Mr Cecil afterwards possessed. About this time, he married the sister of Sir John Cheke, by whom he was recommended to the earl of Hertford, afterwards duke of Somerset and protector.

Soon after king Edward's accession, Mr Cecil came into the possession of his office of *custos breuium*, worth about L. 240 a-year. His first lady dying in 1543, he married the daughter of Sir Anthony Cook, director of the king's studies. In 1547, he was appointed by the protector, master of requests; and soon after, attended his noble patron on his expedition against the Scots, and was present at the battle of Musselburgh. In this battle, which was fought on the 10th of September 1547, Mr Cecil's life was miraculously preserved by a friend, who in pulling him out of the level of a cannon, had his arm shattered to pieces. The fight and judgement of his friend must have been as extraordinary as his friendship, to perceive the precise direction of a cannon shot; unless we suppose, that the ball was almost quite spent; in which case the thing is not impossible. The story is told in his life by a domestic. In the year 1548, Mr Cecil was made secretary of state; but in the following year, the duke of Northumberland's faction prevailing, he suffered in the disgrace of the protector Somerset, and was sent prisoner to the Tower. After three months confinement he was released; in 1551, restored to his office; and, soon after knighted, and sworn of the privy council. In 1553, he was made chancellor of the Order

Order of the Garter, with an annual fee of 100 marks.

On the death of Edward VI. Mr Cecil prudently refused to have any concern in Northumberland's attempt in favour of the unfortunate Lady Jane Grey; and, when queen Mary acceded to the throne, he was graciously received at Court; but, not chusing to change his religion, was dismissed from his employments. During this reign, he was twice elected knight of the shire for the county of Lincoln; and often spoke in the house of commons, with great freedom and firmness, in opposition to the ministry. Nevertheless, though a protestant and a patriot, (that is, a courtier out of place,) he had the address to steer through a very dangerous sea without shipwreck.

Queen Elizabeth's accession, in the year 1558, immediately dispelled the cloud which had obscured his fortunes and ministerial capacity. During the horrid reign of her sister, he had constantly corresponded with the prince of Elizabeth. On the very day of her accession, he presented her with a paper containing twelve articles necessary for her immediate dispatch; and, in a few days after, was sworn of the privy-council, and made secretary of state. His first advice to the queen was, to call a parliament; and the first business he proposed after it was assembled, was the establishment of a national church. A plan of reformation was accordingly drawn up under his immediate inspection, and the legal establishment of the Church of England was the consequence. Sir William Cecil's next important concern, was to restore the value of the coin, which had in the preceding reigns been considerably debased. In 1561, he was appointed master of the wards; and, in 1571, created baron of Burleigh, as a reward for his services, particularly in having lately stifled a formidable rebellion in the north. The following year he was honoured with the garter, and raised to the office of Lord High Treasurer of England. From this period we find him the *primum mobile* of every material transaction during the glorious reign of queen Elizabeth. Notwithstanding the temporary influence of other favourites, Lord Burleigh was, in fact, her prime minister, and the person in whom she chiefly confided in matters of real importance. Having filled the highest and most important offices of the state for 40 years, and guided the helm of government during the most glorious period of English history, he departed this life on the 4th of August 1598, in the 78th year of his age. His body was removed to Stamford, and there deposited in the family vault, where a magnificent tomb was erected to his memory.—Notwithstanding his long enjoyment of such lucrative employments, he left only an estate of L. 4000 *per annum*, L. 11,000 in money, and effects worth about L. 14,000. He lived, indeed, in a manner suitable to his high rank and importance. He had four places of residence, viz. his lodgings at court, his house in the Strand, his seat at Burleigh-Park near Stamford, and his seat at Theobalds. The last of these was his favourite place of retirement, where he frequently entertained the queen at a vast expence.

Lord Burleigh was doubtless a man of singular abilities and prudence; amiable in his private character, and one of the most able, upright, and indefatigable

VOL. III.

ministers ever recorded in the annals of this kingdom. His principal works are, 1. *La Complainte d' l'ame pecheuse*, or the Complaint of a sinful Soul, in French verse, in the king's library. 2. Materials for Patten's *Diarium exped. Scotice*, London 1541, 12^{mo}. 3. Slanders and lies maliciously, grossly, and impudently vomited out, in certain traitorous books and pamphlets, against two counsellors, Sir Francis Bacon, and Sir William Cecil. 4. A speech in parliament, 1562, Strype's Mem. vol. iv. p. 107. 5. Precepts or directions for the well ordering of a man's life, 1637, Harl. Cat. vol. ii. p. 755. 6. Meditations on the death of his lady, Ballard's Mem. p. 184. 7. Meditations on the state of England during the reign of queen Elizabeth, manuscript. 8. The execution of justice in England for the maintenance of public and Christian peace, &c. Lond. 1581, 1583, Somers's tracts, 4th collect. vol. i. p. 5. 9. Advice to queen Elizabeth in matters of religion and state, ib. p. 101. 16. 10. A great number of letters. See Peck's *Dejiderata Curiosa*; Howard's collections, &c. 11. Several pedigrees, some of which are preserved in the archbishop of Canterbury's library at Lambeth, n^o 299, 747.

CECILIA (St), the patroness of music, has been honoured as a martyr ever since the fifth century. Her story as delivered by the notaries of the Roman church, and from them transcribed into the Golden Legend and other books of the like kind, says, that she was a Roman lady born of noble parents, about the year 225. That, notwithstanding she had been converted to Christianity, her parents married her to a young pagan nobleman named Valerianus; who going to bed to her on the wedding night, *as the custom is*, says the book, was given to understand by his spouse, that she was nightly visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus, somewhat troubled at these words, desired that he might see his rival the angel; but his spouse told him that was impossible, unless he would consent to be baptized and become a Christian. This he consented to; after which, returning to his wife, he found her in her closet at prayer, and by her side, in the shape of a beautiful young man, the angel clothed with brightness. After some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he greatly wished to see a partaker of the grace which he himself had received. The angel told him that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and was not long in shewing himself as good as his word; Tiburtius was converted, and both he and his brother Valerianus were beheaded. Cecilia was offered her life upon condition that she would sacrifice to the deities of the Romans; but she refused: upon which she was thrown into a caldron of boiling water, and scalded to death: others say that she was stifled in a dry bath, *i. e.* an inclosure, from whence the air was excluded, having a slow fire underneath it; which kind of death was sometimes inflicted by the Romans upon women of quality who were criminals. Upon the spot where her house stood, is a church said to have been built by pope Urban I. who administered baptism to her husband and his brother: it is the

10 M

church

Cecrops
†
Cedar.

church of St Cecilia at Trastevere; within is a most curious painting of the saint, as also a stately monument with a cumbent statue of her with her face downwards. There is a tradition of St Cecilia, that she excelled in music; and that the angel who was thus enamoured of her, was drawn from the celestial regions by the charms of her melody: this has been deemed authority sufficient for making her the patroness of music and musicians. The legend of St Cecilia has given frequent occasion to painters and sculptors to exercise their genius in representations of her, playing on the organ, and sometimes on the harp. Raphael has painted her fingering with a regal in her hands; and Domenichino and Mignard, fingering and playing on the harp.

CECROPS, the founder and first king of Athens, about the time of Moses the lawgiver of the Hebrews. He was the first who established civil government, religious rites, and marriage among the Greeks; and died after a reign of 50 years. See ATTICA, n° 4.

CEDAR, in botany. See CEDRUS, JUNIPERUS, and LARIX.

The species of cedar famous for its duration, is that popularly called by us the cedar of Lebanon*, by the ancients *cedrus magna*, or the great cedar; also *cedrelate*, *Kidpazan*; and sometimes the Phœnician, or Syrian cedar, from the country where it grows in its greatest perfection. It is a coniferous evergreen, of the bigger sort, bearing large roundish cones of smooth scales, standing erect, the leaves being small, narrow, and thick set.—They sometimes counterfeit cedar, by dying wood of a reddish hue: but the smell discovers the cheat, that of true cedar being very aromatic. In some places, the wood of the cajou tree passes under the name of cedar, on account of its reddish colour, and its aromatic smell, which somewhat resemble that of the cedar. Cedar wood is reputed almost immortal and incorruptible; a prerogative which it owes chiefly to its bitter taste, which the worms cannot endure. For this reason it was that the ancients used cedar tablets to write upon, especially for things of importance, as appears from that expression of Persius, *Et cedro digna locutus*. A juice was also drawn from cedar, with which they smeared their books and writings, or other matters, to preserve them from rotting; which is alluded to by Horace; by means of which it was, that Numa's books, written on papyrus, were preserved entire to the year 535, as we are informed by Pliny.

Solomon's temple, as well as his palace, were both of this wood. That prince gave king Hiram several cities for the cedars he had furnished him on these occasions. Cortes is said to have erected a palace at Mexico, in which were 7000 beams of cedar, most of them 120 feet long, and twelve in circumference, as we are informed by Herrera. Some tell us of a cedar felled in Cyprus 150 feet long, and 18 in diameter. It was used for the main mast in the galley of king Demetrius. Le Bruyn assures us, that the two biggest he saw on mount Lebanon, measured one of them 57 palms, and the other 47, in circumference. In the temple of Apollo at Utica, there were cedar trees near 2000 years old; which yet were nothing to that beam in an oratory of Diana at Seguntum in

Spain, said to have been brought thither 200 years before the destruction of Troy. Cedar is of a dry nature, that it will not endure to be fastened with iron nails, from which it usually shrinks, so that they commonly fasten it with pins of the same wood.

CEDRIA, a refinous liquor issuing from the great cedar tree, or cedar of Lebanon. The word is also written *cedrium*, and *cedrinum*.—Cedria, when good, yields a strong smell, is transparent, and of a thick fatty consistence; so that in pouring it out it does not fall too fast or freely, but equally, drop by drop. It is possessed of two opposite qualities, viz. to preserve dead bodies by its drying and consuming superfluous moisture without damaging the solid parts, and to putrefy the soft and tender parts of living bodies without exciting any pain. The cedria is properly the tear of the cedar; some call it the gum, others the pitch, of the cedar. The same denomination is also given to the *cedrelaon*, or oil of the cedars, which differs little from the resin, except that it is of a thinner consistence.

CEDRUS, the CEDAR-TREE of Barbadoes, and MAHOGANY, &c. As the cedar of Libanus is very properly referred by Linnaeus to the genus LARIX, and all the berry-bearing cedars to that of JUNIPERUS, Mr Miller hath chosen to treat this as a distinct genus; which, to avoid embarrassment from a long detail of different species, seems the most proper method.

Species. 1. The odorata, or Barbadoes cedar, is a native of the British islands in America, and is one of the largest trees to be found there. The wood has a fragrant odour, from whence the name of cedar has been given to it. It grows to the height of 70 or 80 feet: while young, the bark is smooth, and of an ash colour; but, as they advance, the bark becomes rough, and of a darker colour. Towards the top it sends out many side-branches, which are garnished with winged leaves, composed of 16 or 18 pair of lobes, and are sometimes near three feet long: the lobes are broad at their base, and near two inches long, blunt at their ends, and of a pale colour; these emit a very offensive odour in the summer-time. The fruit is oval, of the size of a partridge's egg, smooth, and of a dark colour, and opens in five parts, having a five-cornered column standing in the middle, between the angles of which the winged seeds are closely placed, lapsing over each other like the scales of fishes. 2. The mahogani, or mahogany-tree, is a native of the warmest parts of America; growing plentifully in the islands of Cuba, Jamaica, Hispaniola, and the Bahama islands. In Cuba and Jamaica there are mahogany trees of a very large size, so as to cut into planks of six feet breadth; but those of the Bahama islands commonly do not exceed four. They rise to a great height, though they are generally found growing upon solid rocks, where there is scarce any earth for their nourishment. The leaves of this tree are winged like the ash, having commonly six or eight pair of lobes, which are shorter and broader at the base than those of the ash, where they adhere by the midrib by very short foot-stalks: these lobes are very smooth, having but one vein running through each, which is always on one side, so as to divide them unequally. Mr Catesby has delineated both the flowers and

Cedria
†
Cedrus.

Cedrus
|
Celebes.

and fruit of this tree. The former cannot be depended on, as they were drawn from a withered imperfect fragment; but the fruit is very exact. The fruit before it opens is of a brown colour, growing erect upon long foot-stalks, which closely adhere to the five-cornered column running through the middle, and to which the seeds are fastened, lying *imbricatum* like the scales of a house. When the fruit is ripe, it divides at the bottom into five equal parts; and when these fall off, and the seeds are dispersed, the foot-stalk and the column remain some months after on the tree. 3. The *alternifolius* grows to the height of 80 feet or more. Towards the top it divides into many large branches, garnished with leaves somewhat resembling the witch-hazel; but broader at their base, and cut angular at their top: these are of an ash colour underneath, and set on the branches without any order: the fruit is much larger than that of the Barbadoes cedar, broad at the base, and diminishing gradually to the top, where it terminates in a point. This has also a woody column or core running lengthwise through the fruit, to which the winged seeds adhere as in the former.

Culture, &c. All these plants may be easily propagated by seeds; but, being natives of very warm climates, they must be planted in pots sheltered in a stove. The trunks of the first species are so large, that the inhabitants of those islands where they grow were wont to hollow them, and form them into the shape of boats and periaguas; for which purpose they are extremely well adapted: the wood being soft, may be cut with great facility; and being light, will carry a great load on the water. The wood is often used for waincotting rooms, and to make chests, because vermin do not so frequently breed in it as in other sorts of wood; this having a very bitter taste, which is communicated to whatever is put into the chests, especially while the wood is fresh; for which reason it is never made into casks, and the liquors put into them would dissolve part of the bitter resin. The uses of mahogany are so well known that it is needless to enumerate them. As for the wood of the third species, we have no accounts whether it is ever used in buildings or for other purposes.

CELANDINE, in botany. See CHELIDONIUM.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. gr. *cE* None whose understanding is limited can be omniscient.

LA Every man's understanding is limited.

rEnt Therefore no man is omniscient.

CELASTRUS, the STAFF-TREE; a genus of the monogynia order, belonging to the pentandria class of plants. There are five species, all natives of warm climates. In Senegal the negroes use the powder of the root as a specific against gonorrhoeas, which it is said to cure in eight, or sometimes in three days. An infusion of the bark of a species of staff-tree, which grows in the isle of France, is said to possess the same virtues.

CELEBES, an island in the Indian sea, seated under the equator, and called by some *Macassar*. The

length and breadth has not been accurately computed; but the circumference, at a medium, is about eight hundred miles. It had formerly six kingdoms, which are reduced to one. The air is hot and moist; and subject to great rains during the north-west winds, which blow from November to March, at which time the country is overflowed, and for this reason they build their houses on piles of wood ten feet high. The most healthful time is during the northern monsoons, which seldom fail blowing regularly in one part of the year. The chief vegetables are rice and coconuts; but they have ebony, sanders, &c. Their fruits and flowers are much the same as in the neighbouring parts of the Indies. They have pepper, sugar, betel, areca, the finest cotton, and opium. The natives have bright olive complexions, and the women have shining black hair. They are thought to be very handsome by the Dutch and Chinese, who often purchase them for bedfellows. The men are industrious, robust, and make excellent soldiers. Their arms are sabres, and trunks, from whence they blow poisoned darts, which are pointed with the tooth of a sea-fish. Some likewise use poisoned daggers. They were the last of the Indian nations that were enslaved by the Dutch, which could not be effected till after a long war. They teach their children to read and write, and their characters have some resemblance of the Arabic. Their religion being Mahometan, the men indulge themselves in many wives and concubines. The employment of the women is spinning, cookery, and making their own and their husbands cloaths. The men wear jewels in their ears, and the women gold chains about their necks. The inhabitants in general go half naked, without any thing on their head, legs, or feet, and some have nothing but a cloth about their middle. The streets of the town Macassar are spacious, and planted with trees on every side. It stands by the side of the only large river they have in the island. The Dutch have a fort here, mounted with 40 guns, and garrisoned with 700 men. There is only one other town of note, called Jampandani, where they also have a fort. The island is not near so populous as when the Dutch conquered it; the men being hired for soldiers in most of the neighbouring countries.

The religion of these islands was formerly idolatry. They worshipped the sun and moon. They sacrificed to them in the public squares, having no materials which they thought valuable enough to be employed in raising temples. About two centuries ago, some Christians and Mahometans having brought their opinions to Celebes, the principal king of the country took a dislike to the national worship. Having convened a general assembly, he ascended an eminence, when, spreading out his hands towards heaven, he told the deity, that he would acknowledge for truth that doctrine whose ministers should first arrive in his dominions, and, as the winds and waves were at his command, the Almighty would have himself to blame if he embraced a falsehood. The assembly broke up, determined to wait the orders of heaven, and to obey the first missionaries that should arrive. The Mahometans were the most active, and their religion accordingly prevailed.

Celeres
|
Celibacy.

CCELERES, in Roman antiquity, a regiment of bodyguards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curiæ of the people, each of which furnished ten.

CCELERI, in botany, the English name of a species of *Arum*.

CCELERITY, in mechanics, the swiftness of any body in motion. It is also defined to be an affection of motion, by which any moveable body runs through a given space in a given time.

CELESTINS, a religious order so called from their founder Peter de Meuron, afterwards raised to the pontificate under the name of Celestin V. This Peter, who was born at Isernia, a little town in the kingdom of Naples, in the year 1215, of but mean parents, retired, while very young, to a solitary mountain, in order to dedicate himself wholly to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom, charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community in the year 1254; which was approved by pope Urban IV. in 1264, and erected into a distinct order, called the *hermits of St Damien*. Peter de Meuron governed this order till 1286, when his love of solitude and retirement induced him to quit the charge. In July 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of *Celestins* from him. By his bull he approved their constitutions, and confirmed all their monasteries to the number of 20. But he sat too short time in the chair of St Peter to do many great things for his order; for having governed the church five months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a consistory held at Naples.

After his death, which happened in 1296, his order made great progress not only in Italy, but in France likewise; whither the then general Peter of Tivoli sent twelve religious, at the request of king Philip the Fair, who gave them two monasteries; one in the forest of Orleans, and the other in the forest of Compeigne at mount Chartres. This order likewise passed into several provinces of Germany. They have about 96 convents in Italy, and 21 in France, under the title of priories.

The Celestins rise two hours after midnight, to say matins. They eat no flesh at any time, except when they are sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from that feast to Easter, every day. As to their habit, it consists of a white gown, a capuche, and a black scapulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELIBACY, the state of unmarried persons. Scaliger derives the word from the Greek *κατὰ*, "bed," and *λεγω*, *linguo*, "I leave:" others say it is formed from *celi beatitudo*; q. d. the blessedness of heaven.

The ancient Romans used all means imaginable to

Celibate.

dissuade celibacy. Nothing was more usual than for the censors to impose a fine on bachelors. Dionysius Halicarnassensis mentions an ancient constitution whereby all persons of full age were obliged to marry. But the first law of that kind, of which we have any certainty, is that under Augustus, called *lex Julia de maritandis ordinibus*. It was afterwards denominated *Papia Poppæa*, and more usually *Julia Papia*, in regard of some new function and amendments made to it under the consuls Papilius and Poppæus. By this law, divers prerogatives were given to persons who had many children; penalties imposed on those who lived a single life, as that they should be incapable of receiving legacies, and not exceeding a certain proportion.

CELIBATE, the same with celibacy; but it is chiefly used in speaking of the single life of the Popish clergy, or the obligation they are under to abstain from marriage. In this sense we say the law of *celibate*. Monks and religious take a vow of celibacy; and what is more, of chastity.

The church of Rome imposes an universal celibacy on all its clergy, from the pope to the lowest deacon and subdeacon. The advocates for this usage pretend, that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. But the contrary is evident from numerous examples of bishops and archbishops, who lived in a state of matrimony, without any prejudice to their ordination or their function. It is generally agreed that most of the apostles were married. Some say all of them, except St Paul and St John. Others say St Paul himself was married, because he writes to his *yoke-fellow*, whom they interpret his wife. Be this as it will, in the next ages after the apostles, we have accounts of divers married bishops, presbyters, and deacons, without any reproach or mark of dishonour set on them: e. g. Valens, presbyter of Philippi, mentioned by Polycarp; and Chæmon, bishop of Nilus. Novatus was a married presbyter of Carthage, as we learn from Cyprian; who himself was also a married man, as Pagi confesses; and so was Cæcilius the presbyter who converted him; and Nuniidius another presbyter of Carthage. The reply which the Romanists give to this, is, that all married persons, when they came to be ordained, promised to live separate from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. For Novatus presbyter of Carthage, was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyprian brings against him, that he had struck and abused his wife, and thereby caused her to miscarry. There seems indeed to have been, in some cases, a tendency towards the introduction of such a law, by one or two zealots; but the motion was no sooner made, than it was quashed by the authority of wiser men. Thus Eusebius observes, that Pinytus, bishop of Gnostus in Crete, was for laying the law of celibacy upon his brethren; but Dionysius bishop of Corinth wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, anno 325, the motion was renewed for a law to oblige the cler-

Celidographia
|
Cell.

Cell
|
Celsia.

gy to abstain from all conjugal society with their wives, whom they had married before their ordination : but Paphnutius, a famous Egyptian bishop, and one who himself never was married, vigorously declaimed against it, upon which it was unanimously rejected. So Socrates and Sodomus tell the story ; to which all that Valefius, after Bellarmin, has to say, is, that he suspects the truth of it. The council in Trullo, held in 692, made a difference in this respect between bishops and presbyters ; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination ; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church, as to bishops, but not any others. In the Latin church, the like establishment was also made, but by slow steps in many places. For in Africa, even bishops themselves cohabited with their wives at the time of the council of Trullo. The celibacy of the clergy, however, appears of an ancient standing, if not of command and necessity, yet as of counsel and choice. But as it is clearly neither of divine nor apostolical institution, it is, at first, hard to conceive from what motive the court of Rome persisted so very obstinately to impose this institution on the clergy. But we are to observe that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence on princes, whose favours have such an influence on private men ; but having no family, they were more at liberty to adhere to the Pope.

CELIDOGRAPHIA, the description of the spots which appear on the surfaces of the sun and planets. See ASTRONOMY, n^o 14—25, and 33—45.

CELL, CELLA, in ancient writers, denotes a place or apartment usually under ground, and vaulted, in which were stored up some sort of necessaries, as wine, honey, and the like ; and according to which it was called *Cella Vinaria*, *Olearia*, *Mellaria*, &c. The word is formed from the Latin *celare*, to conceal.

CELLA was also used for the lodge or habitation of a common prostitute, as being anciently under ground, hence also denominated *fovea*.

CELLA likewise signified the *adyte*, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated were preserved. In this sense we meet with *cella Jovis*, *cella Concordiæ*, &c.

CELL is also used for a lesser or subordinate sort of ministry dependent on a great one, by which it was erected, and continues still to be governed. The great abbays in England had most of them *cells* in places distant from the mother abbey, to which they were accountable, and from which they received their superiors. The alien priories in England were cells to abbays in Normandy, France, Italy &c. The name *cell* was also given to rich and considerable monasteries not dependent on any other.

CELL signifies also a little apartment or chamber, such as those wherein the ancient monks, solitaries, and hermits, lived in retirement.

CELLS are also the little divisions in honey-combs, which are always regular hexagons *.

CELLS, in botany, the hollow places between the partitions in the pods, husks, and other seed-vessels of plants ; according as there is one, two, three, &c. of these cells, the vessel is said to be unilocular, bilocular, trilocular, &c.

CELLS, in anatomy, little bags, or bladders, where fluids or other matters are lodged ; called *loculi*, *cellulae*, &c.

CELLARIUS (Christopher) was born in 1638, at Smalcade in Franconia, of which town his father was minister. He was successively rector of the colleges at Weymar, Zeitz, and Meribourg ; and the king of Prussia having founded an university at Hall in 1693, he was prevailed on to be professor of eloquence and history there, where he composed the greatest part of his works. His great application to study hastened the infirmities of old age ; for it is said, he would spend whole days and nights together at his books, without any attention to his health, or even the calls of nature. His works relate to grammar, geography, history, and the oriental languages, and the number of them is amazing. He died in 1707.

CELLINI (Benvenuto), an eminent statuary, who was bred a jeweller and goldsmith, but seems to have had an extraordinary genius for the fine arts in general. He was cotemporary with Michael Angelo, and Julio Romano ; and was employed by popes, kings, and other princely patrons of sciences and arts, so highly cultivated in the days of Leo X. and Charles V. some of his productions being esteemed most exquisite. He lived to a very considerable old age ; and his life, almost to the last, was a continued scene of adventure, persecution, and misfortune, truly wonderful. He wrote his own history, which was not, however, published till the year 1730, probably on account of the excessive freedom with which he therein treated many distinguished personages of Italy and other countries. It was translated into English by Dr Nugent in 1771, to which the reader is referred, as it will not admit of an abridgement suitable to the design of this work.

CELLULAR, in a general sense, is applied to any thing consisting of single cells.

CELLULAR Membrane. See ANATOMY, n^o 82, et seq.

CELOSIA, COCKS-COMB ; a genus of the monogynia order, belonging to the pentandria class of plants. There are eight species, of which the most worthy of notice is the *crispata*, or common cocks-comb, so called on account of its crested head of flowers, resembling a cock's comb ; of these there are a great variety of species. The principal colours of their flowers are red, purple, yellow, and white ; but there are some whose heads are variegated with two or three colours. The heads are sometimes divided like a plume of feathers, and are of a beautiful scarlet colour. These plants are very tender exotics, and require a great deal of care to cultivate them in this country. Three hot-beds must be prepared ; a small

one

* See APIS, n^o 11. and Plate XXV. fig. 7, 8, 9.

Celsus.

one in March, on which to raise the plants an inch or two in height; a second in April, of larger dimensions, in which to transplant them when proper; and a third in May for a large frame, to receive them transplanted into pots, to remain till the end of June or beginning of July to grow to full size: all of which hot-beds must be covered with frames and glasses, and have five or six inches depth of fine rich light earth for the reception of the seed and plants; and in the second and third hot-bed, the frames must occasionally be raised or augmented, according as the plants shall rise in height.

CELSUS (Aurelius Cornelius), a celebrated physician of the first century, who wrote eight books on medicine, in elegant Latin. He was the Hippocrates of the Latins, and Quintilian gives him a high eulogium. The great Boerhaave tells us, that Celsus is one of the best authors of antiquity for letting us into the true meaning and opinions of Hippocrates; and that, without him, the writings of this father in physic would be often unintelligible, often misunderstood by us. He shews us also how the ancients cured distempers by friction, bathing, &c. His eight books of *Medicina* have been several times printed. The Elzivir edition, in the year 1650, by Vander Linden, is the best, as being entirely corrected from his manuscripts.

CELSUS, an epicurean philosopher in the second century. He wrote a work against the Christians, intitled, *The true Discourse*; to which Origen, at the desire of Ambrose his friend, wrote a learned answer. To this philosopher Lucian dedicated his *Pseudomantis*.

CELTE, or CELTES, an ancient nation, by which most of the countries of Europe are thought to have been peopled. The compilers of the Universal History are of opinion, that they are descended from Gomer the eldest son of Japhet, the son of Noah. They think that Gomer settled in the province of Phrygia in Asia: Ashkenaz his eldest son, or Togarmah his youngest, or both, in Armenia, and Riphath the second son in Cappadocia. When they spread themselves wider, they seem to have moved regularly in columns without interfering with or disturbing their neighbours. The descendants of Gomer, or the Celts, took the left hand, insensibly spreading themselves westward towards Poland, Hungary, Germany, France, and Spain; while the descendants of Magog, Gomer's brother, moving eastward, peopled Tartary.

In this large European tract, the Celtes began to appear a powerful nation under a regular monarchy, or rather under several considerable kingdoms. Mention is made of them indeed in so many parts of Europe, by ancient geographers and historians, that Ortelius took *Celtica* to be a general name for the continent of Europe, and made a map of it bearing this title. In those parts of Asia which they possessed, as well as in the different parts of Europe, the Celtes went by various names. In Lesser Asia they were known by the names of *Titans* and *Sacks*; in the northern parts of Europe, by those of *Gymmerians*, *Cymbrians*, &c.; and in the southern parts they were called Celtes, Gauls, or Galatians.

With respect to the government of the Celtes we

Celsus.

are entirely in the dark. All we know is, that the cures, and afterwards druids and bards, were the interpreters of their laws; judged all causes whether criminal or civil; and their sentence was reckoned so sacred, that whoever refused to abide by it was by them excluded from assisting at their sacred rites; after which no man dared converse with him; so that this punishment was reckoned the most severe of all, even severer than death itself.

They neither reared temples nor statues to the deity, but destroyed them wherever they could find them, planting in their stead large spacious groves; which being open on the top and sides, were, in their opinion, more acceptable to the divine Being, who is absolutely unconfined. In this their religion seems to have resembled that of the Persees and disciples of Zoroaster. The Celtes only differed from them in making the oak, instead of the fire, the emblem of the deity; in chusing that tree above all others to plant their groves with, and attributing several supernatural virtues both to its wood, leaves, fruit, and misletoe; all which were made use of in their sacrifices and other parts of their worship. But after they had adopted the idolatrous superstition of the Romans and other nations, and the apotheosis of their heroes and princes, they came to worship them much in the same manner: as Jupiter under the name of *Taran*, which in the Celtic signifies thunder: Mercury, whom some authors call *Hent*, or *Hesus*, probably from the Celtic *huadh*, which signifies a dog, and might be the *Anubis latrans* of the Egyptians. But Mars was held in the greatest veneration by the warlike, and Mercury by the trading part of the nation. The care of religion was immediately under their cures, since known by the name of druids and bards. These were, as Cæsar tells us, the performers of sacrifices and all religious rites, and expounders of religion to the people. They also instructed youth in all kinds of learning, such as philosophy, astronomy, astrology, &c. Their doctrines were taught only by word of mouth, esteeming them too sacred to be committed to writing. Other more common subjects, such as their hymns to their gods, the exploits of princes and generals in time of war, and especially before a battle, were couched in elegant verse, and recited, or rather sung, on all proper occasions; though even these were also kept from vulgar eyes, and either committed to memory, or if to writing, the whole was a secret to all the laity. The latter indeed seems the most probable, if what Cæsar hints be true; namely, that these poetic records were increased in his time to such a bulk, that it took up a young bard near 20 years to learn them by heart. Diodorus tells us farther, that these poets used to accompany their songs with instrumental music, such as that of organs, harps, and the like; and that they were held in such veneration, that if, in the time of an engagement between two armies, one of these bards appeared, both sides immediately ceased fighting. The reason of this was, that they were universally believed to be prophets, as well as poets; so that it was thought dangerous, as well as injurious, to disobey what they supposed came from their gods. These prophetic philosophers kept academies, which were resorted to not only by a great number of their own youth,

but

Celtis
|
Cedrus.

but also of those from other countries, inasmuch that Aristotle says, their philosophy passed from thence into Greece, and not from Greece thither. Diodorus likewise quotes a passage from Hecateus, which is greatly in their praise; viz. that the druids had some kind of instruments by which they could draw distant objects nearer, and make them appear larger and plainer; and by which they could discover even seas, mountains, and vallies, in the moon. But whatever might be their learning, it is certain, that in process of time they adopted several very barbarous customs, such as sacrificing human victims to their gods as more acceptable to them than those of any other animals. And Diodorus tells us of another inhuman custom they used in their divinations, especially in great matters, which was done by killing some of their slaves, or some prisoners of war, if any they had, with a scimitar, to draw their augury from the running of his blood from his mangled limbs.

For the history, &c. of the different Celtic nations see the article GAUL, &c.

CELTES, certain ancient instruments of a wedge-like form, of which several have been discovered in different parts of Great Britain. Antiquarians have generally attributed them to the Celts; but, not agreeing as to their use, distinguished them by the above unmeaning appellation. But Mr Whittaker makes it probable that that they were British battle-axes. See BATTLE-AX.

CELTIBERIA (anc. geog.) a country of the Hither Spain, along the right or south-west side of the river Iberus; though sometimes the greatest part of Spain was called by the name of Celtiberia. The people were denominated *Celtiberi*, or the Celts seated on the Iberus. They were very brave and warlike, their cavalry in particular was excellent. They wore a black and rough cloak, the flag of which was like goats hair. Some of them had light bucklers like the Gauls; others hollow and round ones like those of other nations. They all wore boots made of hair, and iron helmets adorned with crests of a purple colour. They used swords which cut on both sides, and pinnards of a foot long. Their arms were of an admirable temper, and are said to have been prepared in the following manner: they buried plates of iron under ground, where they let them remain till the rust had eaten the weakest part of the metal, and the rest was consequently hard and firm. Of this excellent iron they made their swords, which were so strong and well tempered, that there was neither buckler nor helmet that could resist their edge. The Celtiberians were very cruel towards their enemies and malefactors, but shewed the greatest humanity to their guests. They not only cheerfully granted their hospitality to strangers, who travelled in their country, but were desirous that they should seek protection under their roof.

CELTIS, the LOTUS, or *Nettle-tree*; a genus of the monœcia order, belonging to the polygamia class of plants. There are three species, all of them hardy deciduous trees, with leaves somewhat resembling the common nettle, proper for ornamental plantations, and two of them also proper for forest-trees. 1. The australis rises with a large upright stem, and very

branchy head, to the height of 40 or 50 feet, garnished with large spear-shaped, pointed, and deeply serrated leaves, with greenish flowers produced in May from the sides of the branches; succeeded by round black fruit, of the size of a black-berry. It is a native of the southern parts of Europe. 2. The occidentalis is a native of America, and hath a large upright stem, with a very branchy head like the former; grows to the height of 40 or 50 feet; with large, oval, sharp-pointed; and deeply sawed oblique leaves; greenish flowers from the sides of the branches in May, succeeded by purple fruit of the size of large peas. 3. The orientalis was discovered by Dr Tournefort in America. It rises with an upright stem, dividing into many spreading, greenish branches, ten or twelve feet high; small, oval, heart-shaped, serrated, oblique leaves; yellowish flowers from the sides of the branches in the spring, succeeded by large, oval, yellow fruit. There are several varieties of each sort, with blotched leaves. They may be propagated by seeds, but the blotched-leaved kinds only by layers, cuttings, grafting, &c. The seeds ought to be sown in autumn, and covered with earth half an inch deep. When the plants appear, they will require to be sheltered by mats from the cold.

CEMENT, in a general sense, any glutinous substance capable of uniting and keeping things together in close cohesion. In this sense the word *cement* comprehends mortar, folder, glue, &c. but has been generally restrained to the compositions used for holding together broken glasses, china, and earthen ware. For this purpose the juice of garlic is recommended as exceedingly proper, being both very strong, and, if the operation is performed with care, leaving little or no mark. Quicklime and the white of an egg mixed together, and expeditiously used, are also very proper for this purpose. Dr Lewis recommends a mixture of quicklime and cheese, in the following manner: "Sweet cheese shaved thin and stirred with boiling hot water, changes into a tenacious lime which does not mingle with the water. Worked with fresh parcels of hot water, and then mixed upon a hot stone, with a proper quantity of unslaked lime, into the consistence of a paste, it proves a strong and durable cement for wood, stone, earthen-ware, and glass. When thoroughly dry, which will be in two or three days, it is not in the least acted upon by water. Cheese barely beat with quicklime, as directed by some of the chemists for luting cracked glasses, is not near so efficacious." A composition of the drying oil of lintseed and white-lead is also used for the same purposes, but is greatly inferior.

CEMENT in building, is used to denote any kind of mortar of a stronger kind than ordinary. The cement commonly used is of two kinds; hot, and cold. The hot cement is made of rosin, bees wax, brick-dust, and chalk, boiled together. The bricks to be cemented are heated, and rubbed one upon another, with cement between them. The cold cement is that above described for cementing china, &c. which is sometimes, though rarely, employed in building.

The ruins of the ancient Roman buildings are found to cohere so strongly, that most people have imagined the ancients were acquainted with some kind of mortar,

Cement.

Cement.

mortar, which, in comparison of ours, might justly be called *cement*; and that to our want of knowledge of the materials they used, is owing the great inferiority of modern buildings in their durability. In 1770, one M. Lorient, a Frenchman, pretended to have discovered the secret of the ancient cement, which, according to him, was no more than a mixture of powdered *quick-lime* with lime which had been long slacked and kept under water. The slacked lime was first to be made up with sand, earth, brick-dust, &c. into mortar after the common method, and then about a third part of quick-lime in powder was added to the mixture. This produced an almost instantaneous petrification, something like what is called the *setting* of alabaster, but in a much stronger degree; and was possessed of many wonderful qualities needless here to relate, seeing it has never been known to succeed with any other person who tried it. Mr. Anderson, in his essays on agriculture, has discussed this subject at considerable length, and seemingly with great judgment. He is the only person we know, who has given any rational theory of the uses of lime in building, and why it comes to be the proper basis of all cements. His account is in substance as follows:

Lime which has been slaked and mixed with sand, becomes hard and consistent when dry, by a process similar to that which produces the natural *stalactites* in caverns. These are always formed by water dropping from the roof. By some unknown and inexplicable process of nature, this water has dissolved in it a small portion of calcareous matter in a *caustic* state. As long as the water continues covered from the air, it keeps the earth dissolved in it; it being the natural property of calcareous earths, when deprived of their fixed air, to dissolve in water. But when the small drop of water comes to be exposed to the air, the calcareous matter contained in it begins to attract the fixable part of the atmosphere. In proportion as it does so, it also begins to separate from the water, and to reassume its native form of limestone or marble. This process, Mr. Anderson calls a *crystallization*; and when the calcareous matter is perfectly *crystallized* in this manner, he affirms that it is to all intents and purposes limestone or marble of the same consistency as before: and "in this manner, (says he,) within the memory of man, have huge rocks of marble been formed near Matlock in Derbyshire." If lime in a caustic state is mixed with water, part of the lime will be dissolved, and will also begin to crystallize. The water which parted with the crystallized lime, will then begin to act upon the remainder, which it could not dissolve before; and thus the process will continue, either till the lime be all reduced to an *effete*, or, (as he calls it) *crystalline* state, or something hinders the action of the water upon it. It is this crystallization which is observed by the workmen when a heap of lime is mixed with water, and left for some time to macerate. A hard crust is formed upon the surface, which is ignorantly called *frothing*, though it takes place in summer as well as in winter. If therefore the hardness of the lime, or its becoming a cement, depends entirely on the formation of its crystals, it is evident, that the perfection of the cement must depend on the perfection of the crystals,

Cement.

and the hardness of the matters which are entangled among them. The additional substances used in making of mortar, such as sand, brick-dust, or the like, according to Mr. Anderson, serve only for a purpose similar to what is answered by sticks put into a vessel full of any saline solution, namely to afford the crystals an opportunity of fastening themselves upon it. If therefore the matter interposed between the crystals of the lime is of a friable, brittle nature, such as brick-dust or chalk, the mortar will be of a weak and imperfect kind; but when the particles are hard, angular, and very difficult to be broken, such as those of river or pit-sand, the mortar turns out exceedingly good and strong. Sea-sand is found to be an improper material for mortar, which Mr. Anderson ascribes to its being less angular than the other kinds. That the crystallization may be the more perfect, he also recommends a large quantity of water, that the ingredients be perfectly mixed together, and that the drying be as slow as possible. An attention to these circumstances, he thinks, would make the buildings of the moderns equally durable with those of the ancients; and from what remains of the ancient Roman works, he thinks a very strong proof of his hypothesis might be adduced. The great thickness of their walls necessarily required a vast length of time to dry. The middle of them was composed of pebbles thrown in at random, and which have evidently had mortar so thin as to be poured in among them. By this means, a great quantity of the lime would be dissolved, and the crystallization performed in the most perfect manner; and the indefatigable pains and perseverance for which the Romans were so remarkable in all their undertakings, leave no room to doubt that they would take care to have the ingredients mixed together as well as possible. The consequence of all this is, that the buildings formed in this manner are all as firm as if cut out of a solid rock; the mortar being equally hard, if not more so, than the stones themselves. For the proper proportion of lime and sand requisite in building, see the article MORTAR.

CEMENT, among engravers, jewellers, &c. is the same with the hot cement used in building*; and is used for keeping the metals to be engraven firm to the block, and also for filling up what is to be chiselled.

CEMENT, in chemistry, is used to signify all those powders and pastes with which any body is surrounded in pots or crucibles, and which are capable by the help of fire of producing changes upon that body. They are made of various materials; and are used for different purposes, as for parting gold from silver, converting iron into steel, copper into brass: and by cementation, more considerable changes can be effected upon bodies, than by applying to them liquids of any kind; because the active matters are then in a state of vapour, and assisted by a very considerable degree of heat.

CEMENT which quickly hardens in Water. This is described in the posthumous works of Mr. Hooke, and is recommended for gilding live craw-fish, carps, &c. without injuring the fish. The cement for this purpose is prepared, by putting some Burgundy pitch into a new earthen pot, and warming the vessel till it receives so much of the pitch as will stick round it; then

* See the foregoing article.

Cement
|
Censor.Censor
|
Censorinus.

then strewing some finely powdered amber over the pitch when growing cold, adding a mixture of three pounds of linseed oil, and one of oil of turpentine, covering the vessel and boiling them for an hour over a gentle fire, and grinding the mixture as it is wanted with as much pumice-stone in fine powder as will reduce it to the consistence of paint. The fish being wiped dry, the mixture is spread upon it; and the gold leaf being then laid on, the fish may be immediately put into water again, without any danger of the gold coming off, for the matter quickly grows hard in the water.

CEMENT-POTS, are those earthen pots used in the cementation of metals.

CEMENTATION, the act of corroding or otherwise changing a metal by means of a cement. See the foregoing article.

CEMETERY, *Κοιμητήριον*, from *κοιμαιναι* to "sleep;" a place set apart or consecrated for the burial of the dead.

Anciently none were buried in churches or churchyards: it was even unlawful to inter in cities, and the cemeteries were without the walls. Among the primitive Christians these were held in great veneration. It even appears from Eusebius and Tertullian, that, in the early ages, they assembled for divine worship in the cemeteries. Valerian seems to have confiscated the cemeteries and other places of divine worship, but they were restored again by Gallienus. As the martyrs were buried in these places, the Christians chose them for building churches on, when Constantine established their religion; and hence some derive the rule which still obtains in the church of Rome, never to consecrate an altar without putting under it the relics of some saint. The practice of consecrating cemeteries is of some antiquity. The bishop walked round it in procession, with the crozier or pastoral staff in his hand, the holy water pot being carried before, out of which the aspersions were made.

CENOBIITE. See **COENOBITE**.

CENOTAPH, in antiquity, an empty tomb, erected by way of honour to the deceased. It is distinguished from a sepulchre, in which a coffin was deposited. Of these there were two sorts; one for those who had, and another for those who had not, been honoured with funeral rites in another place.

The sign whereby honorary sepulchres were distinguished from others, was commonly the wreck of a ship, to denote the decease of the person in some foreign country.

CENSER, a vase containing incense to be used in offering sacrifices. It was used by the heathens as well as Jews, and is still used in the Romish churches.

CENSOR, (from *censere* to "see" or "perceive"), one of the prime magistrates in ancient Rome.—Their business was to register the effects of the Roman citizens, to impose taxes in proportion to what each man possessed, and to take cognizance or inspection of the manners of the citizens. In consequence of this last part of their office, they had a power to censure vice or immorality by inflicting some public mark of ignominy on the offender. They had even a power to create the *princeps senatus*, and to expel from the senate such as they deemed unworthy of that office.

VOL. III.

This power they sometimes exercised without sufficient grounds; and therefore, a law was at length passed, that no senator should be degraded or disgraced in any manner, until he had been formally accused and found guilty by both the censors. It was also a part of the censorian jurisdiction, to fill up the vacancies in the senate, upon any remarkable deficiency in their number; to let out to farm all the lands, revenues, and customs, of the republic; and to contract with artificers for the charge of building and repairing all the public works and edifices both in Rome, and the colonies of Italy. In all parts of their office, however, they were subject to the jurisdiction of the people; and an appeal always lay from the sentence of the censors to that of an assembly of the people.

The first two censors were created in the year of Rome 311, upon the senate's observing that the consuls were so much taken up with war, as not to have time to look into other matters. The office continued to the time of the emperors, who assumed the censorial power, calling themselves *morum prefetti*; though Vespasian and his sons took the title of censors. Decius attempted to restore the dignity to a particular magistrate. After this we hear no more of it, till Constantine's time, who made his brother censor, and he seems to have been the last that enjoyed the office.

The office of censor was so considerable, that for a long time none aspired to it, till they had passed all the rest; so that it was thought surprising that Crassus should be admitted censor, without having been either consul or prætor. At first the censors enjoyed their dignity for five years, but in 420 the dictator Mamertinus made a law restraining it to a year and an half, which was afterwards observed very strictly. At first one of the censors was elected out of a patrician, and the other out of a plebeian family; and upon the death of either, the other was discharged from his office, and two new ones elected, but not till the next lustrum. In the year of Rome 622, both censors were chosen from among the plebeians; and after that time the office was shared between the senate and people.—After their election in the Comitia Centuriata, the censors proceeded to the capitol, where they took an oath not to manage either by favour or disaffection, but to act equitably and impartially throughout the whole course of their administration.

The republic of Venice still has a censor of the manners of their people, whose office lasts six months.

CENSORS of Books, are a body of doctors or others established in divers countries, to examine all books before they go to the press, and to see they contain nothing contrary to faith and good manners.

At Paris, the faculty of theology claim this privilege, as granted to them by the pope; but, in 1624, new commissions of four doctors were created, by letters-patent, the sole censors of all books, and answerable for every thing contained therein.

In England, we had formerly an officer of this kind, under the title of licenser of the press; but, since the revolution, our press has been laid under no such restraint.

CENSORINUS, a celebrated writer in the third century, well known by his treatise *De Die Natali*. This treatise, which was written about the year 238,

10 N

Gerard

Gerard Vossius calls it a little book of gold; and declares it to be a most learned work, of the highest use and importance to chronologers, since it connects and determines, with great exactness, some of the principal eras in pagan history. It was printed at Cambridge, with the notes of Lindenbrokius, in 1695.

CENSURE, a judgment which condemns some book, person, or action, or, more particularly, a reprimand from a superior. Ecclesiastical censures, are penalties by which, for some remarkable misbehaviour, Christians are deprived of the communion of the church, or prohibited to execute the sacerdotal office.

CENSUS, in Roman antiquity, an authentic declaration made before the censors, by the several subjects of the empire, of their respective names and places of abode. This declaration was registered by the censors; and contained an enumeration, in writing, of all the estates, lands, and inheritances they possessed; their quantity, quality, place, wives, children, domestics, tenants, slaves. In the provinces the census served not only to discover the substance of each person, but where, and in what manner and proportion, taxes might be imposed. The census at Rome is commonly thought to have been held every five years; but Dr Middleton hath shewn, that both census and lustrum were held irregularly and uncertainly at various intervals. The census was an excellent expedient for discovering the strength of the state: for by it they discovered the number of the citizens, how many were fit for war, and how many for offices of other kinds; how much each was able to pay of taxes, &c. It went through all ranks of people, though under different names: that of the common people was called *census*; that of the knights, *census, recensio, recognitio*; that of the senators, *lectio, religio*.

The census which intitled one to the dignity of a knight, was 400,000 sesterces: that of a senator, was double that sum.

In the Voconian law, census is used for a man whose estate in the censor's books is valued at 100,000 sesterces.

CENT, signifies properly an hundred, being an abridgement of the word *centum*; but is often used in commerce to express the profit or loss arising from the sale of any commodity: so that when we say there is 10 per cent profit, or 10 per cent loss, upon any merchandise that has been sold, it is to be understood, that the seller has either gained or lost ten pounds on every hundred pounds of the price at which he bought that merchandise; which is $\frac{1}{10}$ of profit, or $\frac{1}{10}$ of loss, upon the total of the sale.

CENTAURS, in mythology, a kind of fabulous monsters, half men and half horses.—The poets pretend that the centaurs were the sons of Ixion and a cloud; the reason of which fancy is, that they retired to a castle called *νεφέλη*, which signifies a "cloud."—This fable is differently interpreted: some will have the centaurs to have been a body of shepherds and herdsmen, rich in cattle, who inhabited the mountains of Arcadia, and to whom is attributed the invention of bucolic poetry. Palephatus, in his book of incredibles, relates, that under the reign of Ixion, king of Thessaly, a herd of bulls on mount Thessaly run mad, and rava-

ged the whole country, rendering the mountains inaccessible; that some young men who had found the art of taming and mounting horses, undertook to clear the mountains of these animals, which they purified on horseback, and thence obtained the appellation of *Centours*. This success rendering them insolent, they insulted the Lapithæ, a people of Thessaly; and because when attacked they fled with great rapidity, it was supposed they were half horses and half men.—The Centaurs in reality were a tribe of Lapithæ, who inhabited the city Pelethronium adjoining to mount Pelion, and first invented the art of breaking horses, as is intimated by Virgil.

CENTAUREA, GREATER CENTAURY; a genus of the polygamia frustanea order, belonging to the syn-genesia class of plants. There are 61 species. The root of one of them called *glasifolia*, is an article in the materia medica. It has a rough, somewhat acrid taste, and abounds with a red viscid juice. Its rough taste has gained it some esteem as an astringent; its acrimony, as an aperient; and its glutinous quality, as a vulnerary; but the present practice takes very little notice of it in any intention. Another of the species is the cyanus or blue-bottle, which grows commonly among corn. The expressed juice of this flower stains linen of a beautiful blue colour, but is not permanent. Mr Boyle says, that the juice the inner petals, with a little alum, makes a beautiful permanent colour, equal to ultramarine.

Lesser CENTAURY. See **GENTIANA**.

CENTENARIUS, or CENTENARIO, in the middle age, an officer who had the government or command, with the administration of justice, in a village. The centenarii as well as vicarii were under the jurisdiction and command of the court. We find them among the Franks, Germans, Lombards, Goths, &c.

CENTENARIUS was also used for an officer who had the command of 100 men; most frequently called a **CENTURION**.

CENTENARIUS, in monasteries, was an officer who had the command of 100 monks.

CENTENINUM OVUM, among naturalists, denotes a sort of hen's egg much smaller than ordinary, vulgarly called a *cock's egg*; from which it has been fabulously held that the cockatrice or basilisk is produced. The name is taken from an opinion, that these are the last eggs which hens lay, having laid 100 before; whence *centeninum*, q. d. the hundredth egg.—These eggs have no yolks, but in other respects differ not from common ones; having the albumen, chazazes, membranes, &c. in common with others. In the place of the yolk is found a little body like a serpent coiled up, which doubtless gave rise to the fable of the basilisk's origin from thence. Their origin is with probability ascribed by Hervey to this, that the yolks in the vitellary of the hen are exhausted before the albumina.

CENTER, or CENTRE, in a general sense, signifies a point equally distant from the extremities of a line, figure, or body. The word is formed from the Greek *κέντρον*, a "point."

CENTER of Gravity, in mechanics, that point about which all the parts of a body do in any situation exactly balance each other.

CENTER

CENTER of Motion, that point which remains at rest, while all the other parts of a body move about it.

CENTER of a Sphere, a point in the middle, from which all lines drawn to the surface are equal.

Hermes Trifingestus defines God an intellectual sphere, whose center is every where, and circumference no where.

CENTESIMATION, a milder kind of military punishment, in cases of desertion, mutiny, and the like, when only every hundredth man is executed.

CENTILOQUIUM, denotes a collection of 100 sentences, opinions, or sayings.

The centiloquium of Hermes, contains 100 aphorisms, or astrological sentences, supposed to have been written by some Arab, falsely fathered on Hermes Trifingestus. It is only extant in Latin, in which it has several times been printed.—The centiloquium of Ptolemy is a famous astrological piece, frequently confounded with the former, consisting likewise of 100 sentences, or doctrines, divided into short aphorisms, intitled also in Greek *κατάμνησις*, as being the fruit or result of the former writings of that celebrated astronomer, viz. his *quadripartitum* and *almagestum*; or rather, by reason that herein is shewn the use of astrological calculations.

CENTIPES, in zoology. See *SCOLOPENDRA*.

CENTIPED WORM, a term used for such worms as have a great many feet, though the number does not amount to 100, as the term seems to import.—M. Maloet relates the history of a man, who, for three years, had a violent pain in the lower part of the forehead near the root of the nose: at length he felt an itching, and afterwards something moving within his nostril, which he brought away with his finger; it was a worm of the centiped kind, an inch and a half long, which run swiftly. It lived five or six days among tobacco. The patient was free of his pain ever after. Mr LITTLE mentioned a like case in 1708, of a larger centiped voided at the nose, after it had thrown the woman, in whose frontal sinus it was, into convulsions, and had almost deprived her of her reason.

CENTLIVRE (Susanna), a celebrated comic writer, was the daughter of Mr Freeman of Holbeach, in Lincolnshire; and had such an early turn for poetry, that it is said she wrote a song before she was seven years old. Before she was twelve years of age, she could not only read Moliere in French, but enter into the spirit of all the characters. Her father dying, left her to the care of a step-mother, whose treatment not being agreeable to her, she determined, though almost destitute of money and every other necessary, to go up to London to seek a better fortune than what she had hitherto experienced. As she was proceeding on her journey on foot, she was met by a young gentleman from the University of Cambridge, the afterwards well-known Anthony Hammond, Esq; who was so extremely struck with her youth and beauty, that he fell instantly in love with her; and inquiring into the particulars of her story, soon prevailed upon her unexperienced innocence to seize on the protection he offered her, and go with him to Cambridge. After some months cohabitation, he persuaded her to come to London; where, in a short

time, she was married to a nephew of Sir Stephen Fox. But that gentleman not living with her above a twelve-month, her wit and beauty soon procured her a second husband, whose name was *Carrol*, and who was an officer in the army; but he having the misfortune to be killed in a duel about a year and an half after their marriage, she became a second time a widow. For the sake of support she now applied to her pen, and became avotary of the muses; and it is under this name of *Carrol* that some of her earlier pieces were published. Her first attempt was in tragedy, in a play called the *Injured Husband*; yet her natural vivacity leading her afterwards to comedy, we find but one more attempt in the buskin, among 18 dramatic pieces which she afterwards wrote.

In 1706, she wounded the heart of one Mr Joseph Centlivre, yeoman of the mouth, or in other words principal cook, to her Majesty, who married her; and, after passing several years happily together, she died at his house in Spring-Garden, Charing-Cross, in December 1723.

This lady for many years enjoyed the intimacy and esteem of the most eminent wits of the times, viz. Sir Richard Steele, Mr Rowe, Budgell, Farquhar, Dr Sewell, &c. and very few authors received more tokens of esteem and patronage from the great. With regard to her merit as a writer, it must be allowed that her plays do not abound with wit, and that the language of them is sometimes even poor, enervate, incorrect, puerile; but then her plots are busy and well conducted, and her characters in general natural and well marked.

CENTO, in poetry, a work wholly composed of verses or passages promiscuously taken from other authors, only disposed in a new form and order.—*Proba Falconia* has written the life of Jesus Christ in centos taken from Virgil. Alexander Ross has done the like in his *Christados*, and Stephen de Pleure the same.

CENTONARIUM, in antiquity, certain of the Roman army, who provided different sorts of stuff called centones, made use of to quench the fire which the enemies engines threw into the camp.

These centonarii kept with the carpenters and other officers of artillery.

CENTRAL FORCES, the powers which cause a moving body to tend towards, or recede from, the center of motion. See *MECHANICS*.

CENTRAL RULE, a rule discovered by Mr Thomas Baker, whereby to find the center of a circle designed to cut the parabola in as many points as an equation to be constructed hath real roots. Its principal use is in the construction of equations, and he hath applied it with good success as far as biquadratics.

The central rule is chiefly founded on this property of the parabola, that, if a line be inscribed in that curve perpendicular to any diameter, a rectangle formed of the segments of the infcript is equal to the rectangle of the intercepted diameter and parameter of the axis.

The central rule has the advantage over Cartes and De Latere's methods of constructing equations, in that both these are subject to the trouble of preparing the equation by taking away the second term.

Centrifugal.

CENTRIFUGAL FORCE, that force by which all bodies that move round any other body in a curve, endeavour to fly off from the axis of their motion in a tangent to the periphery of the curve, and that in every part of it. See **MECHANICS**.

CENTRIFUGAL Machine, a very curious machine, invented by Mr Erskine, for raising water by means of the centrifugal force combined with the pressure of the atmosphere.

It consists of a large tube of copper, &c. in the form of a cross, which is placed perpendicular in the water, and rests at the bottom on a pivot. At the upper part of the tube is a horizontal cog-wheel, which touches the cogs of another in a vertical position; so that by the help of a double winch, the whole machine is moved round with very great velocity.

Near the bottom of the perpendicular part of the tube is a valve opening upwards; and near the two extremities, but on the contrary sides of the arms, or cross part of the tube, are two other valves opening outwards. These two valves are, by the assistance of springs, kept shut till the machine is put in motion, when the centrifugal velocity of the water forces them open, and discharges itself into a cistern or reservoir placed there for that purpose.

On the upper part of the arms are two holes, which are closed by pieces screwing into the metal of the tube. Before the machine can work, these holes must be opened, and water poured in through them, till the whole tube be full: by this means all the air will be forced out of the machine, and the water supported in the tube by means of the valve at the bottom.

The tube being thus filled with water, and the holes closed by their screw caps, it is turned round by means of the winch, when the water in the arms of the tube acquires a centrifugal force, opens the valves near the extremities of the arms, and flies out with a velocity nearly equal to that of the extremities of the said arms.

The above description will be very easily understood by the figure we have added on Plate LXXV. fig. 3. which is a perspective view of the centrifugal machine, erected on board a ship. ABC is the copper tube. D, a horizontal cog-wheel, furnished with twelve cogs. E, a vertical cog-wheel, furnished with thirty-six cogs. F, F, the double winch. a, the valve near the bottom of the tube. b, b, the two pivots on which the machine turns. c, one of the valves in the cross-piece; the other at d, cannot be seen in this figure, being on the other side of the tube; e, e, the two holes through which the water is poured into the machine. GH, the cistern, or reservoir. I, I, part of the ship's deck. The distance between the two valves c, d, is six feet. The diameter of these valves is about three inches; and that of the perpendicular tube about seven inches.

If we suppose the men who work the machines can turn the winch round in three seconds, the machine will move round its axis in one second; and consequently each extremity of the arms will move with a velocity of 18.8 feet in a second. Therefore a column of water of three inches diameter will issue through each of the valves with a velocity of 18.8 feet in a second: but the area of the aperture of each

of the valves is 7.14 inches; which being multiplied by the velocity in inches=225.6, gives 1610.784 cubic inches, the quantity of water discharged through one of the apertures in one second; so that the whole quantity discharged in that space of time through both the apertures is=3221.568 inches; or 193294.08 cubic inches in one minute. But 60812 cubic inches make a tun, beer-measure; consequently, if we suppose the centrifugal machine revolves round its axis in one second, it will raise nearly 3 tuns 44 gallons in one minute: but this velocity is certainly too great, at least to be held for any considerable time; so that, when this and other deficiencies in the machine are allowed for, two tuns is nearly the quantity that can be raised by it in one minute.

It will perhaps be unnecessary to observe, that as the water is forced up the perpendicular tube by the pressure of the atmosphere, this machine cannot raise water above 32 feet high.

An attempt was made to substitute this machine in place of the pumps commonly used on ship-board, but the labour of working was found to be so great as to render the machine inferior to the chain-pump. A considerable improvement, we apprehend, would be, to load with a weight of lead the ends of the tubes through which the water issues, which would make the machine turn with a great deal more ease, as the centrifugal force of the lead would in some measure act the part of a fly.

CENTRIPETAL FORCE, that force by which a body is every where impelled, or any how tends, towards some point as a center. See **MECHANICS**.

CENTRISCUS in ichthyology, a genus of fishes belonging to the order of amphibia nantes. The head gradually ends in a narrow snout, the aperture is broad and flat; the belly is carinated; and the belly-fins united. There are two species, viz. 1. The scutatus has its back covered with a smooth bony shell, which ends in a sharp spine under which is the tail; but the back-fins are between the tail and the spine. It is a native of the East Indies. 2. The scolopax has a rough scabrous body, and a straight extended tail. It has two belly-fins, with four rays in each, and has no teeth. It is found in the Mediterranean.

CENTUMVIRI, in Roman antiquity, judges appointed to decide common causes among the people: they were chosen, three out of each tribe; and though five more than an hundred, were nevertheless called *centumviri*, from the round number *centum*, an hundred.

CENTURION, among the Romans, an officer in the infantry, who commanded a century, or an hundred men.

In order to have a proper notion of the centuries, it must be remembered, that every one of these triarii * in a legion was divided into two *ordini*, or ranks; and consequently the three bodies of the hastati, principes, and triarii, into 20 orders a-piece, as into 10 manipuli. Now, every manipulus was allowed two centuries, or captains, one to each order or century: and, to determine the point of priority between them, they were created at two different elections. The 30 who were made first always took the precedence of their fellows; and therefore commanded the right-hand orders, as the others did the left.

Centripetal
|
Centurion.

* See Manipulus.

left. The triarii, or *pilani*, so called from their weapon the *pilum*, being esteemed the most honourable, had their centurions elected first, next to them the principes, and afterwards the hastati; whence they were called *primus et secundus pilus*, *primus et secundus princeps*, *primus et secundus hastatus*; and so on. Here it may be observed, that *primi ordines* is sometimes used in historians for the centurions of these orders; and the centurions are sometimes styled *principes ordinum*, and *principes centurionum*. We may take notice too what a large field there lay for promotion: first through all the orders of the hastati; then quite through the principes; and afterwards from the last order of the triarii to the prinipilus, the most honourable of the centurions, and who deserves to be particularly described. This officer, besides his title of prinipilus, went under the several titles of *dux legionis*, *præfectus legionis*, *primus centurionum*, and *primus centurio*; and was the first centurion of the triarii in every legion. He presided over all the other centurions, and generally gave the word of command by order of the tribunes. Besides this, he had the care of the eagle, or chief standard, of the legion; hence, *aquila præfatus*, is to bear the dignity of prinipilus; and hence *aquila* is taken by Pliny for the said office. Nor was this station only honourable, but very profitable too: for he had a special stipend allowed him, probably as much as a knight's estate; and, when he left that charge, was reputed equal to the members of the equestrian order, bearing the title of *prinipiliarius*, in the same manner as those who had discharged the greatest civil offices were styled ever after, *consulares*, *censores*, &c.

CENTURY, in a general sense, any thing divided into, or consisting of, an hundred parts.

The marquis of Worcester published a *Century* of inventions, (for a specimen of which, see ACOUSTICS, n° 28.) ; and Dr Hooke has given a *decimate* of inventions, as part of a *Century*, of which he affirmed himself master. It is remarkable, that both in the century of the former, and the decimate of the latter, we find the principle on which Savary's fire or steam engine is founded. See STEAM-ENGINE.

CENTURY in antiquity. The Roman people, when they were assembled for the electing of magistrates, enacting of laws, or deliberating upon any public affair, were always divided into centuries, and voted by centuries, in order that their votes might be the more easily collected, whence these assemblies were called *comitia centuriata*. The Roman cohorts were also divided into centuries. See CENTURION, and COHORT.

CENTURY, in chronology, the space of one hundred years. This method of computing by centuries is generally observed in church-history, commencing from the time of our Saviour's incarnation: in which sense we say the first century, the second century, &c.

CENTURIES of Magdeburg, a famous ecclesiastical history, ranged into 13 centuries, carried down to the year 1298, compiled by several hundred Protestants of Magdeburg, the chief of whom was Flacius Illyricus.

CENTUSSIS, in Roman antiquity, a coin containing 100 asses.

CEPA, the ONION; is by Linnæus referred to the genus of allium; the botanic difference of it from garlic is, the swelling pipy stalk, which is much larger in the middle than at either end. The varieties are, the Stralsburgh, the Spanish, and the Egyptian onion. They are propagated by seeds, which should be sown the latter end of February, or the beginning of March, on good, light, rich ground, well dug and levelled, and cleared from weeds. They should also be sown at a time when the surface of the ground is not moist; and where they are intended for a winter crop they must not be sown too thick. The common allowance is six pounds of seed to an acre; though some allow more, in order to have a crop to draw out, which they call cullings. In about six weeks after, the onions will be up and forward enough to hoe; at which time the weeds should be lightly cut up with a small hoe, about two inches and a half broad, as also the onions themselves where they grow too close in bunches, leaving them at this first time, at least two or three inches apart. This, if properly performed, and in a dry season, will preserve the ground clear of weeds at least a month, when they must be hoed over again, leaving them at this time about four or five inches asunder. In six weeks after, they must be hoed a third time. The weeds are now to be carefully cut up, and the onions singled out so as to leave them about six inches square, by which means they will grow much larger than if left too close. This, if well performed, in case the weather proves dry, will keep the onions till they are fit to pull; but if the weather should prove moist, and any of the weeds take root again, the weeds must be pulled out with the hand; for the onions having now begun to bulb, must not be disturbed with a hoe. Towards the middle of August the onions will have arrived at their full growth, which may be known by their blades falling to the ground and shrivelling. At this time therefore, before their necks or blades are withered off, they should be drawn out of the ground, the extreme part of the blade cut off, and the onions laid upon a dry spot of ground, observing to turn them every other day at least, to prevent them from taking root again; which in moist weather they would be apt to do. At any rate they are very apt to grow in the lofts where they are kept all winter; the most effectual method of preventing which is, with a hot iron, slightly to touch their beads or roots, which will effectually prevent their sprouting; but in doing this, great caution must be used not to scorch the pulp; for that will cause them to perish soon after. In order to save seeds, you must in the spring make choice of some of the largest, firmest, and best shapen onions, (in quantity proportionable to the seed you intend to save) and having prepared a piece of good ground, which should be well dug, and laid out in beds about three feet wide, the onions must be planted in the beginning of March in the following manner: Having strained a line of about four inches within the side of the bed, you must with a spade throw out an opening six inches deep, the length of the bed, into which you should place the onions with their roots downward, at about nine inches distance from each other; and with a rake draw the earth into the opening again to

cover

Cep.
||
Cephalanthus.

cover the bulbs; then proceed to remove the line again about a foot farther back, where you must make an opening as before, and so again, till the whole is finished, by which you will have four rows in each bed; between each bed you must allow the space of two feet for an alley to go among them. In a month's time the leaves will appear above ground, and many of the roots will produce three or four stalks each. About the beginning of June, when the flowers begin to appear, the stalks must be tied to stakes to prevent them from being broke by their own weight. About the end of August the seed will be ripe, which may be known by the opening of the cells which contain it, and its changing to a brown colour. When the heads are cut off, they should be spread abroad upon coarse cloths in the sun, observing to keep it under shelter in the night, as also in wet weather. When the heads are quite dry, the seeds should be beat out from them; and after being cleared from the hulks, and exposed one day to the sun to dry, they may be put up in bags for use.

Besides the above mentioned species of onions, the scallions, or scallions, Welsh onions, and cives were formerly in great repute. The former is a sort which never forms any bulbs at the roots, and was chiefly used in the spring for green onions; but is now become so scarce as hardly to be known. Some gardeners instead of the scallion, substitute such onions as decay and sprout in the house. These they plant in a bed early in the spring, and in a short time they become large enough for use. The true scallion is easily propagated by parting the roots either in spring or autumn; but the latter is preferable. The roots should be planted three or four in a hole, and about six inches distance every way.

The cives are a very small sort of onion, which never produce any bulbs, and seldom grow above six inches high in the blade, which is very small and slender. They grow in round bunches like the former. They are propagated by parting their roots like the former, and are very hardy.

The Welsh onions are propagated only for spring use; they never make any bulbs, and are therefore fit only to be used green for salads. They are sown in the end of July, in beds about three feet and a half wide. In a fortnight's time they appear above ground, but in October their blades die, and the ground becomes quite naked; in January, however, they will again appear very strong, and in March will be fit to draw for young onions.

Onions are supposed to afford little nourishment; and, when eaten liberally, produce flatulencies, occasion thirst, head-achs, and turbulent dreams; in cold phlegmatic habits, where viscid mucus abounds, they are undoubtedly of use, by their stimulatory and attenuating qualities. By some they are strongly recommended in suppressions of urine and dropsies. Their chief medicinal use at present, however, is in external applications, as a cataplasm for suppurating tumours, &c.

CEPHALALGIA, or HEAD-ACH. See (the *Index* subjoined to) MEDICINE.

CEPHALANTHUS, BUTTON-WOOD; a genus of the monogynia order, belonging to the tetrandria class

of plants. There is only one species, a native of North America, from whence the seeds are imported into Britain, and great numbers of the plants raised in the gardens of the curious. It seldom rises higher than five or six feet in this country. The branches come out opposite, sometimes by pairs, and at other times there are three arising at the same joint. The ends of the branches are terminated by spherical heads, about the size of a marble, each of which are composed of many small flowers, funnel-shaped, and of a whitish yellow colour, fastened to an axis that stands in the middle. They are propagated chiefly by seeds, though many are also raised from cuttings: they require a little shelter from cold when young, as well as from the sun in very hot weather; but in other respects are hardy enough. They thrive best in a moist soil.

CEPHALIC, in a general meaning, signifies any thing belonging to the head.

CEPHALIC Medicines, are remedies for disorders of the head. Cordials are comprehended herein, as are also whatever promotes a free circulation of the blood through the brain.

Except when the disorder arises from excess of heat, or an inflammatory disposition in the head, moist topicals should never be used; but always dry ones.

To rub the head after it is shaved proves an instantaneous cure for a cephalalgia, a stuffing of the head, and a weakness of the eyes, arising from a weak and relaxed state of the fibres. And as by every fresh evacuation of the humours their quantity is not only lessened, but also their recementitious parts derived thither, the more frequently the head is shaved, the larger quantity of humour is discharged; so that the frequent shaving of the head and beard is likewise a perpetual blister; and in as much as it is useful, it is a cephalic.

CEPHALIC Vein, in anatomy, creeps along the arm between the skin and the muscles, and divides it into two branches: the external goes down to the wrist, where it joins the basilica, and turns up to the back of the hand; the internal branch, together with a small one of the basilica, makes the median. See Plate XVII. 10, 10. 12.

The ancients used to open this vein for disorders of the head, for which reason it bears this name; but a better acquaintance with the circulation of the blood informs us, that there is no foundation for such a notion.

CEPHALONIA, the capital of an island of the same name, situated in the Mediterranean, near the coast of Epirus, and subject to the Venetians. E. Long. 21. N. Lat. 30. 30.

CEPHEUS, in fabulous history, a king of Arcadia, on whose head Minerva fastening one of Medusa's hairs, he was rendered invincible.

CEPHEUS, in astronomy, a constellation of the northern hemisphere. See ASTRONOMY, n° 206.

CERAM, an island in the Indian ocean, between the Molucca islands on the north, and those of Amboyna and Banda on the south, lying between E. Long. 126. and 129. in S. Lat. 3. It is about 150 miles long, and 60 broad; and here the Dutch have a fortress, which keeps the natives in subjection.

CERAMBYX,

Cephalic
||
Ceram.

Cerambyx
|
Ceraunia.

CERAMBYX, in zoology, a genus of insects of the beetle kind, belonging to the order of insecta coleoptera. The antennæ are long and small; the breast is spinous or gibbous; and the elytra are linear. There are no less than 83 species enumerated by Linnaeus, principally distinguished by the figure of the breast.

CERASTES, in zoology, the trivial name of a species of *ANGUIS* and *COLUMBER*.

CERASTIUM, MOUSE-EAR; a genus of the pentagynia order, belonging to the decandria class of plants. There are 16 species, but none of them possessed of any remarkable property.

CERASUS, in botany. See *PRUNUS*.

CERATE, in pharmacy, a thickish kind of ointment, applied to ulcerations, excoriations, &c. See *PHARMACY*, n° 980. 1010, 1011, 1012.

CERATION, the name given by the ancients to the small seeds of *Ceratonia*, used by the Arabian physicians as a weight to adjust the doses of medicines; as the grain weight with us took its rise from a grain of barley.

CERATION, or *Ceratum*, was also a silver coin, equal to one third of an obolus.

CERATOCEPHALUS, in botany. See *BIDENS*.

CERATOIDES, in botany. See *URTICA*.

CERATONIA, the *CAROB*, or *Sr John's-bread*; a genus of the polyæcia order, belonging to the polygamia class of plants. There is but one species, a native of Spain, of some parts of Italy, and the Levant. It is an ever-green; and, in the countries where it is native, grows in the hedges. It produces a quantity of long, flat, brown-coloured pods, which are thick, leathery, and of a sweetish taste. These pods are many times eaten by the poorer sort of inhabitants when there is a scarcity of other food; but they are apt to loosen the belly, and cause gripings of the bowels. The tree may be propagated in this country from seeds, which are to be sown on a moderate hot-bed, and the plants inured to the open air by degrees.

CERAUNIA, **CERAUNIAS**, or **CERAUNIUS**, *Lapis*, in natural history, a sort of flinty stone of no certain colour, but of a pyramidal or wedge-like figure; popularly supposed to fall from the clouds in the time of thunder-storms, and to be possessed of divers notable virtues, as promoting sleep, preserving from lightning, &c. The word is from the Greek *νεφελος*, *thunder-bolt*. The *ceraunia* is the same with what is otherwise called the thunder-stone, or thunder-bolt; and also sometimes *figitta*, or arrow's-head, on account of its shape. The *ceraunia* are frequently confounded with the omuriz and brontiz, as being all supposed to have the same origin. The generality of naturalists take the *ceraunia* for a native stone, formed among the Pyrites, of a saline, concrete, mineral juice. Mercatus and Dr Woodward assert it to be artificial, and to have been fashioned thus by tools. The *ceraunia*, according to these authors, are the heads of the ancient weapons of war, in use before the invention of iron; which, upon the introduction of that metal, growing into disuse, were dispersed in the fields through this and that neighbouring country. Some of them had possibly served in the early ages for axes,

others for wedges, others for chisels; but the greater part for arrow-heads, darts, and lances. The *ceraunia* is also held by Pliny for a white or crystal-coloured gem, that attracted lightning to itself. What this was, is hard to say. Prudentius also speaks of a yellow *ceraunia*; by which he is supposed to mean the carbuncle or pyropus.

CERBERA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The most remarkable species is the *atracur*, a native of the warm parts of America. It rises with an irregular stem to the height of eight or ten feet, sending out many crooked diffused branches, which towards their tops are garnished with thick succulent leaves of a lucid green, smooth, and very full of a milky juice. The leaves come out in loose bunches at the end of the branches; they are of a cream colour, having long narrow tubes, and at the top are cut into five obtuse segments, which seem twisted, so as to stand oblique to the tube. The wood of this tree stinks most abominably, and the kernels of the nuts are a deadly poison to which there is no antidote; so that the Indians will not even use the wood for fuel.

CERBERUS, in fabulous history, a dreadful three-headed mastiff, born of Typhon and Echidna, and placed to guard the gates of hell. He fawned upon those who entered, but devoured all who attempted to get back. He was, however, mastered by Hercules, who dragged him up to the earth, when, in struggling, a foam dropped from his mouth, which produced the poisonous herb called *aconite* or *wolf's-bane*.

CERCELE, in heraldry: a cross cercele is a cross, which opening at the ends, turns round both ways like a ram's horn. See *CROSS*.

CERCIS, the **JUDAS-TREE**; a genus of the monogynia order, belonging to the decandria class of plants.

Species 1. The *siliquastrum*, or common Judas-tree, is a native of the south of France, Spain, and Italy. It rises with an upright trunk to the height of 12 or 14 feet, covered with a dark reddish bark, and divides upward into many irregular branches, garnished with round, heart-shaped, smooth leaves, placed irregularly on the branches, having long foot-stalks. The flowers come out on every side of the branches, and many times from the stem of the tree, in clusters, having short foot-stalks; they are of a very bright purple colour, so make a fine appearance, especially when the branches are covered pretty thick with them. The leaves having an agreeable poignancy, are frequently eaten in salads. There are other two varieties of this tree; one with a white, and the other with a flesh-coloured flower; but the first is the most beautiful. 2. The *canadensis*, or red-bud tree, is a native of most parts of North America, and hath flowers resembling the former, but inferior in beauty. These plants are hardy enough to bear the open air, and are easily propagated from seeds. The wood of the first sort is beautifully veined with black and green, and takes a fine polish. By the Portuguese it is called the *tree of love*.

CERCOPTHECI, in natural history, the name given by Mr Ray to monkeys, or the class of apes with long tails. See *APES* and *SIMIA*.

CERDA (John Lewis de la), a learned Jesuit of Toledo, wrote large commentaries on Virgil, which have

Cerbera
||
Cerda.

Cerdonians have been much esteemed; also several other works.

He died in 1643, aged 80.

Cerebellum.

CERDONIANS, ancient heretics, who maintained most of the errors of Simon Magus, Saturninus, and the Manichees. They took their name from their leader *Cerdon*, a Syrian, who came to Rome in the time of Pope Hyginus, and there abjured his errors: but in appearance only; for he was afterwards convicted of perfiting in them, and accordingly cast out of the church again. Cerdon asserted two principles; the one good, and the other evil: this last, according to him, was the creator of the world, and the god that appeared under the old law. The first, whom he called *unknown*, was the father of Jesus Christ; who, he taught, was incarnate only in appearance, and was not born of a virgin; nor did he suffer death but in appearance. He denied the resurrection; and rejected all the books of the Old Testament, as coming from an evil principle. Marcion, his disciple, succeeded him in his errors.

CERFALIA, in antiquity, feasts of Ceres, instituted by Triptolemus, son of Celeus king of Eleusine in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn and making bread.

There were two feasts of this kind at Athens; the one called *Eleusinia*, the other *Thefophoria*. See the article ELEUSINIA. What both agreed in, and was common to all the *cerealia*, was, that they were celebrated with a world of religion and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters. It was not Ceres alone that was honoured here, but also Bacchus. The victims offered were hogs, by reason of the waste they make in the products of the earth: whether there was any wine offered, or not, is matter of much debate among the critics. Plautus and Macrobius seem to countenance the negative side; Cato and Virgil the positive. Macrobius says, indeed, they did not offer wine to Ceres, but *mulsum*, which was a composition of wine and honey boiled up together: that the sacrifice made on the 21st of December to that goddess and Hercules, was a pregnant sow, together with cakes and mulsum; and that this is what Virgil means by *Mili Baccho*. The *cerealia* passed from the Greeks to the Romans, who held them for eight days successively; commencing, as generally held; on the fifth of the ides of April. It was the women alone who were concerned in the celebration, all dressed in white: the men, likewise in white, were only spectators. They eat nothing till after sun-set; in memory of Ceres, who in her search after her daughter took no repast but in the evening.

After the battle of Cannæ, the desolation was so great at Rome, that there were no women to celebrate the feast, by reason they were all in mourning; so that it was omitted that year.

CERFALIA, in botany, from *Ceres* the goddess of corn; Linnaeus's name for the larger esculent seeds of the grasses: these are rice, wheat, rye, barley, oats, millet, panic grass, Indian millet, holcus, zizania, and maize. To this head may be likewise referred *dandel*, (*scilium*); which, by preparation, is rendered esculent.

CEREBELLUM. See ANATOMY, n° 398.

CEREBRUM, the BRAIN. Its structure and use are not so fully known as some other parts of the body, and different authors consider it in various manners. However, according to the observations of those most famed for their accuracy and dexterity in anatomical inquiries, its general structure is as given in ANATOMY, n° 397.

Dr Hunter observes, that the principal parts of the medullary substance of the brain in ideots and madmen, such as the *thalami nervorum opticorum*, and *medulla oblongata*, are found entirely changed from a medullary to a hard, tough, dark-coloured substance, sometimes resembling white leather.

CEREMONIAL, (*ceremoniale*), a book in which is prescribed the order of the ceremonies to be observed in certain actions and occasions of solemnity and pomp. The ceremonial of the Roman church is called *ordo Romanus*. It was published in 1516 by the bishop of Corcyra; at which the college of cardinals were so scandalized, that some of them voted to have the author as well as book burnt, for his temerity in exposing the sacred ceremonies to the eyes of profane people.

CEREMONIAL is also used for the set or system of rules and ceremonies which custom has introduced for regulating our behaviour, and which persons practise towards each other, either out of duty, decency, or civility.

CEREMONIAL, in a more particular sense, denotes the manner in which princes and ambassadors use to receive and to treat one another. There are endless disputes among sovereigns about the *ceremonial*: some endeavouring to be on a level, and others to be superior; inasmuch that numerous schemes have been proposed for settling them. The chief are, 1. to accommodate the difference by compromise, or alternation, so that one shall precede now, the other the next time; or one in one place, and the other in another: 2. By seniority; so that an elder prince in years shall precede a younger, without any other distinction. These expedients, however, have not yet been accepted of by any, except some *alternate princes*, as they are called, in Germany.

CEREMONIAL is more particularly used in speaking of the laws and regulations given by Moses relating to the worship of God among the ancient Jews. In this sense it amounts to much the same with what is called the *Levitical law*, and stands contradistinguished from the moral as well as judicial law.

CEREMONY, an assemblage of several actions, forms and circumstances, serving to render a thing more magnificent and solemn.

In 1646, M. Ponce published a history of ancient ceremonies, tracing the rise, growth, and introduction of each rite into the church, and its gradual advancement to superstition therein. Many of them were borrowed from Judaism; but more, seemingly, from Paganism. Dr Middleton has given a fine discourse on the conformity between the pagan and popish ceremonies, which he exemplifies in the use of incense, holy water, lamps, and candles, before the shrines of saints, votive gifts or offerings round the shrines of the deceased, &c. In effect the altars; images, crosses, processions, miracles, and legends; nay, even the very hierarchy, pontificate, religious orders, &c. of the present

||
Ceremony.

Ceremonies sent Romans, he shews are all copied from their heathen ancestors.—We have an ample and magnificent account of the religious ceremonies and customs of all nations the world, represented in figures designed by Picart, with historical explanations, and many curious dissertations.

Master of the CEREMONIES, an officer instituted by King James I. for the more honourable reception of ambassadors and strangers of quality. He wears about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, *beatæ pacifici*; and on the other, an emblem of war, with *Deum et non dicitur*: his salary is 300 l. per annum.

Assistant Master of the CEREMONIES, is to execute the employment in all points, whenever the master of the ceremonies is absent. His salary is 141 l. 13 s. and 4 d. per annum.

Marshal of the CEREMONIES is their officer, being subordinate to them both. His salary is 100 l. per annum.

CERENZA, a town of Italy in the kingdom of Naples, and in the Hither Calabria, with a bishop's see. It is seated on a rock in E. Long. 17. 5. N. Lat. 39. 23.

CERES, a Pagan deity, the inventor or goddess of corn; in like manner as Bacchus was of wine.

According to the poets, she was the daughter of Saturn and Ops, and the mother of Proserpine, whom she had by Jupiter. Pluto having stolen away Proserpine, Ceres travelled all over the world in quest of her daughter, by the help of a torch, which she had lighted in Mount Ætna.

As Ceres was thus travelling in search of her daughter, she came to Celesus king of Eleusis, and undertook to bring up his infant son Triptolemus. Being desirous to render her charge immortal, she fed him in the day-time with divine milk, and in the night covered him with fire. Celesus observing an unusual improvement in his son, resolved to watch his nurse, to which end he hid himself in that part of the house where she used to cover the child with fire; but when he saw her put the infant under the embers, he cried out and discovered himself. Ceres punished the curiosity and indiscretion of the father with death. Afterwards she taught the youth the art of sowing corn and other fruits, and mounted him in a chariot drawn by winged dragons, that he might traverse the world, and teach mankind the use of corn and fruits. After this, having discovered, by means of the nymph Arethusa, that Proserpine was in the infernal regions, she applied to Jupiter, and obtained of him that Proserpine should be restored, on condition that she had tasted nothing during her stay in that place: but it being discovered, by the information of Alcaphus, that, as she was walking in Pluto's orchard, she had gathered an apple, and had tasted of some of the seeds, he was for ever forbidden to return. Ceres, out of revenge, turned Alcaphus into an owl. At length, Jupiter, to mitigate her grief, permitted that Proserpine should pass one half of the year in the infernal regions with Pluto, and the other half with her mother on earth.

Cicero speaks of a temple of Ceres at Catania in Sicily, where was a very ancient statue of that goddess,

but entirely concealed from the sight of men, every thing being performed by matrons and virgins.

CERET, a town of France in Roussillon, with a magnificent bridge of a single arch. It is seated near the river Tec, in E. Long. 2. 46. N. Lat. 42. 23.

CEREUS, in botany. See **CACTUS**.

CERIGO, an island in the Archipelago, anciently called Cythera; noted for being the birth place of Helen, and, as the poets say, of Venus. At present, there is nothing very delightful in the place; for the country is mountainous, and the soil dry. It abounds in hares, quails, turtle, and excellent falcons. It is about 50 miles in circumference, and had formerly good towns; but there is now none remaining but that which gives name to the island. This is strong both by art and nature, it being seated on a craggy rock. The inhabitants are Christian Greeks, and subject to the Venetians, who keep a governor there, whom they change every two years.

CERINES, a town in the island of Cyprus, with a good castle, an harbour, and a bishop's see. E. Long. 33. 35. N. Lat. 35. 22.

CERINTHE, **HONEYWORT**; a genus of the monogynia order, belonging to the pentandria class of plants. There are three species, natives of Germany, Italy, and the Alps. They are low annual plants with purple, yellow and red flowers, which may be propagated by seed sown in autumn, in a warm situation.

CERINTHIANS, ancient heretics, who denied the deity of Jesus Christ.—They took their name from Cerinthus, one of the first heresiarchs in the church, being cotemporary with St John. See **CERINTHUS**.

They believed that Jesus Christ was a mere man, born of Joseph and Mary: but that, in his baptism, a celestial virtue descended on him in form of a dove; by means whereof he was consecrated by the holy spirit, and made Christ. It was by means of this celestial virtue, therefore, that he wrought so many miracles; which, as he received it from heaven, quitted him after his passion, and returned to the place whence it came: so that Jesus, whom they called a *pure man*, really died and rose again; but that Christ, who was distinguished from Jesus, did not suffer at all. It was partly to refute this sect, that St John wrote his gospel. They received the gospel of St Matthew, to countenance their doctrine of circumcision, from Christ's being circumcised; but they omitted the genealogy. They discarded the epistles of St Paul, because that apostle held circumcision abolished.

CERINTHUS, a heresiarch, cotemporary with the apostles, ascribed the creation not to God, but to angels. He taught that Jesus Christ was the son of Joseph, and that circumcision ought to be retained under the gospel. He is looked upon as the head of the converted Jews, who raised in the church of Antioch the tumult of which St Luke has given the history in the 15th chapter of the Acts. Some authors ascribe the book of the apocalypse to Cerinthus; adding, that he put it off under the name of St John, the better to authorize his reveries touching Christ's reign upon earth: and it is even certain that he published some works of this kind under the title of *Apocalypse*. See **APOCALYPSE**.

Ceret
Cerinthus.

Certhia
|
Certiorari.

CERTHIA, in ornithology, the **CREEPER** or **OX-EYE**, a genus belonging to the order of picæ. The beak of this genus is arched, slender, sharp, and triangular; the tongue is sharp at the point; and the feet are of the walking kind, *i. e.* having the toes open and unconnected. There are 25 species, of which only the *familiaris*, or common ox-eye, is a native of Britain. It is grey above, and white underneath, with brown wings and ten white spots on the ten prime feathers. It creeps up trees; lays about 20 eggs; and feeds upon caterpillars, and the eggs of insects.

CERTIFICATE (*Trial by*), in the law of England, a species of trial allowed in such cases where the evidence of the person certifying is the only proper criterion of the point in dispute *. For when the fact in question lies out of the cognizance of the court, the judges must rely on the solemn averment or information of persons in such a situation as affords them the most clear and competent knowledge of the truth. As therefore such evidence, if given to a jury, must have been conclusive, the law, to save trouble and circuitry, permits the fact to be determined upon such certificate merely. Thus, 1. If the issue be whether A was absent with the king in his army out of the realm in time of war, this shall be tried by the certificate of the marshal of the king's host in writing under his seal, which shall be sent to the justices. 2. If, in order to avoid an outlawry, or the like, it was alleged that the defendant was in prison, *ultra mare*, at Bourdeaux, or in the service of the mayor of Bourdeaux, this should have been tried by the certificate of the mayor; and the like of the captain of Calais. But when this was law, those towns were under the dominion of the crown of England. And therefore, by a parity of reason, it should now hold, that in similar cases arising at Jamaica or Minorca, the trial should be by certificate from the governor of those islands. We also find that the certificate of the queen's messenger, sent to summon home a peeress of the realm, was formerly held a sufficient trial of the contempt in refusing to obey such summons. 3. For matters within the realm; the customs of the city of London shall be tried by the certificate of the mayor and aldermen, certified by the mouth of their recorder; upon a surname from the party alleging it, that the custom ought to be thus tried: else it must be tried by the country. As, the custom of distributing the effects of freemen deceased; of enrolling apprentices; or that he who is free of one trade may use another; if any of these, or other similar points come in issue. 4. The trial of all customs and practice of the courts shall be by certificate from the proper officers of those courts respectively; and what return was made on a writ by the sheriff or under-sheriff, shall be only tried by his own certificate.

CERTIORARI, in law, a writ which issues out of the chancery, directed to an inferior court, to call up the records of a cause there depending, in order that justice may be done. And this writ is obtained upon complaint, that the party who seeks it has received hard usage, or is not like to have an impartial trial in the inferior court. A certiorari is made returnable either in the king's bench, common pleas, or in chancery.

It is not only issued out of the court of chancery,

but likewise out of the king's bench, in which last mentioned court it lies where the king would be certified of a record. Indictments from inferior courts, and proceedings of the quarter-sessions of the peace, may also be removed into the king's bench by a certiorari: and here the very record must be returned, and not a transcript of it; though usually in chancery, if a certiorari be returnable there, it removes only the tenor of the record.

CERTITUDE, considered in the things or ideas which are the objects of our understanding, is a necessary agreement or disagreement of one part of our knowledge with another: as applied to the mind, it is the perception of such agreement or disagreement; or such a firm well-grounded assent, as excludes not only all manner of doubt, but all conceivable possibility of a mistake.

There are three sorts of certitude, or assurance, according to the different natures and circumstances of things.

1. A physical or natural certitude, which depends upon the evidence of sense; as that I see such or such a colour, or hear such or such a sound; no body questions the truth of this, where the organs, the medium, and the object, are rightly disposed. 2. Mathematical certitude is that arising from mathematical evidence; such is, that the three angles of a triangle are equal to two right ones. 3. Moral certitude is that founded on moral evidence, and is frequently equivalent to a mathematical one; as that there was formerly such an emperor as Julius Cæsar, and that he wrote the commentaries which pass under his name; because the historians of these times have recorded it, and no man has ever disproved it since: this affords a moral certitude, in common sense so great, that one would be thought a fool or a madman for denying it.

CERTOSA, a celebrated Carthusian monastery, in the territory of the Pavese, in the duchy of Milan, four miles from Pavia; its park is surrounded with a wall 20 miles in circumference; but there are several small towns and villages therein.

CERVANTES. See **SAAVEDRA**.

CERVERA, a town of Spain in Catalonia, seated on a small river of the same name, in E. Long. 1. 9. N. Lat. 41. 28.

CERVIA, a sea-port town of Italy, in Romagna, with a bishop's see, seated on the gulph of Venice, in E. Long. 13. 5. N. Lat. 44. 16.

CERUSS, **WHITE-LEAD**, a sort of calx of lead, made by exposing plates of that metal to the vapour of vinegar. See **CHEMISTRY**, n° 281.

Ceruls, as a medicine, is used externally either mixed in ointments, or by sprinkling it on old glecting and watery ulcers, and in many diseases of the skin. If, when it is reduced into a fine powder, it is received in with the breath in inspiration, and carried down into the lungs, it causes terrible asthma, that are almost incurable, and at last generally prove fatal: sad instances of the very pernicious effects of this metal are too often seen among those persons who work lead in any form, but particularly among the workers in white-lead.

The painters use it in great quantities; and that it may be afforded cheap to them, it is generally adulterated

rated with common whiting : the English and Dutch cerufs are very bad in this respect : the Venetian ought always to be used by apothecaries.

CERVUS of *Antimony*. See PHARMACY, n° 777.

CERVUS, or DEER, in zoology, a genus of quadrupeds belonging to the order of pecora. The horns are solid, brittle, covered with a hairy skin, and growing from the top ; they likewise fall off and are renewed annually. There are eight fore-teeth in the under jaw, and they have no dog-teeth. The species of this genus enumerated by Linnæus are seven, viz.

1. The Camelopardalis, or Giraffe, with simple or unbranched horns, and the fore-feet remarkably longer than the hind-feet. This is an uncommon animal, few of them having ever been seen in Europe. It is a native of Ethiopia, and is very mild and gentle : the head is like that of a stag ; its horns are blunt and about six inches long. The neck resembles that of a camel, but is much longer, being sometimes seven feet in length. The body is small, covered with white hair, and spotted with red. He is 18 feet in length from the tail to the top of the head ; and when he holds up his head, it is 16 feet from the ground. He feeds principally on the leaves of trees : for, from the strange length of his fore-legs, he cannot graze, without dividing them to a vast distance. He kneels like a camel, when he would lie down.

2. The Alces, or Elk, has palmated horns, without any proper stem, and a fleshy protuberance on the throat. The neck is much shorter than the head, with a short, thick, upright mane, of a light brown colour. The eyes are small ; the ears a foot long, very broad and fouching ; nostrils very large ; the upper lip square, hangs greatly over the lower, and has a deep sulcus in the middle, so as to appear almost bifid. This is the largest animal of the deer kind. At the fair of St Germain at Paris, in the year 1752, a female elk was exhibited as a show. It was caught in the year 1749, in a forest of Red Russia, belonging to a khan of Tartary. The height was six feet seven inches, the length ten feet, and the thickness eight. The hair was long, like that of a wild boar. The elk is a very swift animal ; and he feeds upon leaves of alder, birch, willow, &c. When tamed, he devours large quantities of hay or bread. This animal is found in the northern parts of Europe, Asia, and America. They live amidst the forests for the conveniency of browsing the boughs of trees ; for the great length of their legs, and the shortness of their neck, prevent them from grazing with any sort of ease. They often feed on water-plants, which they can readily get at by wading, and M. Sarrafin says, they are so fond of the *anagris fetida*, or stinking bean-trefoil, as to dig for it with their feet, when covered with snow. They have a singular gait ; their pace is a high shambling trot, but they go with vast swiftness. In old times these animals were made use of in Sweden to draw sledges ; but as they were frequently accessory to the escape of murderers and other great criminals, the use was prohibited under very severe penalties. In passing through thick woods they carry their heads horizontally, to prevent their horns being entangled in the branches. In their common walk they raise their fore-feet very high ; and will with great ease

step over a rail a yard in height. They are inoffensive animals except when wounded, or in the rutting season, when they become very furious, and at that time swim from ille to ille in pursuit of the females. They strike with both horns and hoofs ; are hunted in Canada during winter, when they sink so deep in the snow, as to become an easy prey. The flesh is much commended for being light and nourishing, but the nose is accounted the greatest delicacy in all Canada : the tongues are much esteemed, and are frequently brought here from Russia ; the skin makes excellent buff-leather ; Linnæus says, it will turn a mullet-ball : the hair which is on the neck, withers, and lams of the full grown elk, is used in making mattresses. It is very long, and very elastic. The hoofs were supposed to have great virtues in curing the epilepsy. It was pretended that the elk being subject to that disease, cured itself by scratching its ear with its hoof. The elk was known to the Romans by the name of *Alce* and *Machlis* : they believed that it had no joints in its legs ; and, from the great size of the upper lip, imagined it could not feed without going backward as it grazed.

3. The Elaphus, or Stag, with long cylindrical ramified horns bent backwards. The colour of the stag is generally a reddish brown with some black about the face, and a black list down the hind part of the neck and between the shoulders. This animal is common to Europe, Barbary, the north of Asia, and America. Lives in herds : one male generally supreme in each herd. Furious and dangerous in rutting-time : seeks the female with a violent braying. Rutting season in August. Begins to shed its horns the latter end of February, or beginning of March : recovers them entirely by July. Foud of the sound of the pipe ; will stand and listen attentively. The account of the *cervina fenestus*, or vast longevity of the stag, is fabulous. Hinds go with young above eight months ; bring one at a time, seldom two ; secure the young from the stag, who would destroy it. Flesh of these animals coarse and rank ; skin useful for many purposes. The horns give name to the common volatile alkaline spirits sold in the shops for smelling to.

In Britain the stag is become less common than formerly ; its excessive vicinouness during the rutting season, and the badness of its flesh, induce most people to part with the species. Stags are still found wild in the Highlands of Scotland, in herds of four or five hundred together, ranging at full liberty over the vast hills of the north. Formerly the great Highland chieftains used to hunt with the magnificence of an eastern monarch, assembling four or five thousand of their clan, who drove the deer into the toils, or to the stations the lairds had placed themselves in : but as this pretence was frequently used to collect their vassals for rebellious purposes, an act was passed prohibiting any assemblies of this nature. Stags are likewise met with on the moors that border on Cornwall and Devonshire ; and in Ireland on the mountains of Kerry, where they add greatly to the magnificence of the romantic scenery of the lake of Killarney. The stags of Ireland during its uncultivated state, and while it remained an almost boundless tract of forest, had an exact agreement in habit with those that range at present through

Cervus. the wilds of America. They were less in body, but very fat; and their horns of a size far superior to those of Europe, but in form agreed in all points.

4. The Tarandus, or Rein-deer, is a native of Lapland, and the northern parts of Europe, Asia, and America. The horns are large, cylindrical, branched, and palmated at the tops. Two of the branches hang over the face. He is about the size of a buck, of a dirty whitish colour; the hairs of his skin are thick and strong*. To the Laplanders this animal is the substitute of the horse, the cow, the goat, and the sheep; and is their only wealth: the milk affords them cheese; the flesh, food; the skin, clothing; the tendons, bow-strings; and when split, thread; the horns, glue; the bones, spoons. During the winter it supplies the want of a horse, and draws their sledges with amazing swiftness over the frozen lakes and rivers, or over the snow, which at that time covers the whole country. A rich Laplander is possessed of a herd of 100 rein-deer. In autumn they seek the highest hills, to avoid the Lapland gad-fly, which at that time deposits its eggs in their skin; it is the pest of these animals, and numbers die that are thus visited. The moment a single fly appears, the whole herd instantly perceives it; they fling up their heads, toss about their horns, and at once attempt to fly for shelter amidst the snows of the loftiest Alps. In summer they feed on several plants; but during winter on the rein-liverwort, which lies far beneath the snow, which they remove with their feet and palmated brow antlers, in order to get at their beloved food. They live only 16 years.

5. The Dama, Fallow-deer, or Buck and Doe; with horns branched, compressed, and palmated at the top†. The colour of this deer is various; reddish, deep brown, white, or spotted. Not so universal as the stag; rare in France and Germany. Found in Greece, the Holy Land, and the north of China. In great abundance in England; but, except on a few chases, confined in parks. None originally in America. They are easily tamed; and their flesh, which goes by the name of venison, is in high esteem among the luxurious: during rutting-time they will contest with each other for their mistresses, but are less fierce than the stag; during that season, the male will form a hole in the ground, make the female lie down in it, and then often walk round and smell at her. Moore speaks of a species found on the banks of the Gambia, in the interior parts of Africa, near Barracunda, called *Toncong*, which he says differed not in form from the English fallow-deer; only that its size was equal to that of a small horse, and weighed 300 lb. It had also on its neck an erect black mane, four or five inches long.

6. The Capreolus, or Roe-buck; has erect, cylindrical, branched horns, and forked at the top. The roe-buck is the least of the deer kind; being only three feet nine inches long, two feet three inches high before, and two feet seven inches high behind; weight from 50 to 60 lb. Its make is very elegant, and formed for agility. They prefer a mountainous woody country to a plain one. They were formerly very common in Wales, in the north of England, and in Scotland; but at present the species nowhere exists in

Great Britain, except in the Scottish highlands. In France they are more frequent; they are also found in Italy, Sweden, and Norway; and in Asia they are met with in Siberia. The first that are met with in Great Britain are in the woods on the south-side of Loch-Rannoch, in Perthshire: the last in those of Longwal, on the southern borders of Caithness; but they are most numerous in the beautiful forests of Invercauld, in the midst of the Grampian hills. They are unknown in Ireland. These animals do not keep in herds like other deer, but only in families; they bring two fawns at a time, which the female is obliged to conceal from the buck while they are very young. The flesh of this creature is reckoned a very delicate food. Wild roes, during summer, feed on grass; and are very fond of the *rubus saxatilis*, called in the Highlands the roe-buck berry; but in the winter-time, when the ground is covered with snow, they browse on the tender branches of the fir and birch.

7. The Guineensis, about the size of a cat, is of a greyish colour, and black underneath. It is a native of Guinea, and the size and figure of its horns have not been hitherto described with any precision.

Cervus Volans, in natural history, a name given by authors to the stag-fly, or horned beetle, a very large species of beetle with horns sloped, and something like those of the stag.

CESARE, among logicians, one of the modes of the second figure of syllogisms; the minor proposition of which is an universal affirmative, and the other two universal negatives: thus,

CE No immoral books ought to be read.

SA But every obscene book is immoral;

RE Therefore no obscene books ought to be read.

CESENA, a town of Romagna in Italy, with a bishop's see, subject to the pope, and seated on the river Savio, in E. Long. 12. 46. N. Lat. 44. 8.

CESPITOSÆ PLANTÆ, (from *cespes*, turf or sod,) are those plants which produce many stems from one root, and thence form a close thick carpet on the surface of the earth.

CESPITOSÆ *Paludes*, turf-bogs.

CESSATION, the act of intermitting, discontinuing, or interrupting the course of any thing, work, action, or the like.

CESSATION of Arms, an armistice, or occasional truce. See TRUCE.

When the commander of a place finds things reduced to an extremity, so that he must either surrender, or sacrifice the garrison and inhabitants to the mercy of the enemy, he plants a white flag on the breach, or beats the chamade; on which a cessation of arms and hostilities commences, to give room for a capitulation.

CESSIO BONORUM, in Scots law, the name of that action by which an insolvent debtor may apply for liberation from prison, upon making over his whole real and personal estate to his creditors.

CESSION, in law, an act by which a person surrenders and transmits to another person, a right which belonged to himself. Cession is more particularly used in the civil law for a voluntary surrender of a person's effects to his creditors, to avoid imprisonment. See the article BANKRUPT.

Ceffion
|
Celtus.

In several places the cession carried with it a mark of infamy, and obliged the person to wear a green cap or bonnet; at Lucca, an orange one: to neglect this was to forfeit the privileges of the *cession*. This was originally intended to signify that the cessionary was become poor through his own folly. The Italian lawyers describe the ceremony of cession to consist in striking the bare breech three times against a stone, called *Lapis Vituperii*, in presence of the judge. Formerly it consisted in giving up the girdles and keys in court; the ancients using to carry at their girdles the chief utensils wherewith they got their living; as the scrivener his *escritoire*, the merchant his bag, &c. The form of cession among the ancient Gauls and Romans was as follows. The cessionary gathered up dust in his left hand from the four corners of the house, and standing on the threshold, holding the door-post in his right hand, threw the dust back over his shoulders; then stripping to his shirt, and quitting his girdle and bags, he jumped with a pole over a hedge; hereby letting the world know, that he had nothing left, and that when he jumped all he was worth was in the air with him. This was the cession in criminal matters. In civil cases, it was sufficient to lay a broom, a switch, or a broken straw, on the threshold: this was called *chrenscruda per durpillum et fessucam*.

CESSION, in the ecclesiastical law, is when an ecclesiastical person is created a bishop, or when a parson of a parish takes another benefice, without dispensation, or being otherwise qualified. In both these cases their first benefices became void by cession, without any resignation; and to those livings that the person had, who was created bishop, the king may present for that time, whosoever is patron of them; and in the other case the patron may present: but by dispensation of retainer, a bishop may retain some or all the preferments he was entitled to before he was made bishop.

CESTRUM, BASTARD JASMINE; a genus of the monogynia order, belonging to the pentandria class of plants. There are six species, all of them natives of the warmest parts of America; so cannot be preserved in this country without artificial heat. They are flowering shrubs, rising in height from five to twelve feet, with flowers of a white, herbaceous, or pale yellow colour. The flowers of one species commonly called *Badington Jaspine*, have the property of sending out a strong scent after sunset. They may be propagated either by seeds or cuttings.

CESTUI, a French word, signifying *he or him*, frequently used in the English law writings. Thus, *Cestui qui trust*, a person who has lands, &c. committed to him for the benefit of another; and if such person does not perform his trust, he is compellable to it in chancery. *Cestui qui vie*, one for whose life any lands, &c. are granted. *Cestui qui use*, a person to whose use any one is infeoffed of lands or tenements. Formerly the feelees to uses were deemed owners of the land, but now the possession is adjudged in *cestui qui use*.

CESTUS, among ancient poets, a fine embroidered girdle said to be worn by Venus, to which Homer ascribes the power of charming and conciliating love.

CETACEOUS, an appellation given to the fishes of the whale kind; the characters of which are: they have no gills; there is an orifice on the top of the head, through which they breathe and eject water; and they have a flat or horizontal tail.

Nature on this tribe hath bestowed an internal structure, in all respects agreeing with that of quadrupeds; and in a few others the external parts in both are similar. Cetaceous fish, like land animals, breathe by means of lungs, being destitute of gills. This obliges them to rise frequently to the surface of the water to respire, to sleep on the surface, as well as to perform several other functions. They have the power of uttering sounds, such as bellowing and making other noises denied to genuine fish. Like land animals they have warm blood, are furnished with organs of generation, copulate, bring forth, and suckle their young, shewing a strong attachment to them. Their bodies beneath the skin are entirely surrounded with a thick layer of fat (blubber), analogous to the lard on hogs. The number of their fins never exceeds three, *viz.* two pectoral fins, and one back fin; but in some species the last is wanting. Their tails are placed horizontally, or flat in respect to their bodies; contrary to the direction of those of all other fish which have them in a perpendicular site. This situation of the tail enables them to force themselves suddenly to the surface of the water to breathe, which they are so frequently constrained to do. Many of these circumstances induced Linnæus to place this tribe among his *mammalia*, or what other writers call quadrupeds*. To have preserved the chain of beings * See Zoology, he should in this case have made the genus of *giz*, n° 7. *giz* *phoca* or *seals*, and that of the *trichechus* or *manati*, immediately precede the whale, those being the links that connect the *mammalia* or quadrupeds with the fish: for the seal is, in respect to its legs, the most imperfect of the former class; and in the *manati* the hind feet coalesce, assuming the form of a broad horizontal tail.

Notwithstanding the many parts and properties which cetaceous fish have in common with land animals, yet there still remain others which render it more natural to place them, with Ray, in the rank of fish: the form of their bodies agrees with that of fish; they are entirely naked, or covered only with a smooth skin; they live constantly in the water, and have all the actions of fish.

CETE, the name of Linnæus's seventh order of *mammalia*, comprehending the *MONODON*, *BALÆNA*, *PHYSETER*, and *DELPHINUS*.

CETERACH, in botany, the trivial name of a species of *ASPLENIUM*.

CETTE, a maritime town of France, in Languedoc, seated at the place where the canal of Languedoc begins, between Montpellier and Agde, on the bay of Maguelona in the Mediterranean sea. E. Long. 3. 15. N. Lat. 43. 25.

CETUS, in astronomy, the whale; a large constellation of the southern hemisphere, under Pisces, and next the water of Aquarius. See ASTRONOMY, n° 206.

Cetus is represented by the poets, as the sea-monster which Neptune, at the suit of the nymphs, sent to devour Andromeda for the pride of her mother, and which

Cetaceous.
|
Cetus.

Ceva
|
Ceylon.

which was killed by Perseus. In the mandible of cetus is a variable star which appears and disappears periodically, passing through the several degrees of magnitude both increasing and diminishing, in about 333 days. See ASTRONOMY, n° 9.

CEVA, a strong town of Piedmont in Italy, seated on the river Tanero, with a strong fort, in E. Long. 8. 8. N. Lat. 44. 20.

CEVENNES, mountains of Languedoc in France, remarkable for the frequent meetings of the Protestants there as a place of security against the tyranny of their governors. In queen Anne's reign there was an attempt made to afflict them by an English fleet in the Mediterranean; but to no purpose, for the French had occupied the passages.

CEUTA, a maritime town of Barbary in Africa, and in the kingdom of Fez, seated on the straits of Gibraltar, opposite that place, in W. Long. 6. 25. N. Lat. 36. 35. John king of Portugal took it from the Moors in 1415, but it now belongs to Spain. In 1697, it sustained a vigorous siege by the Moors.

CEYLON, a large island in the East Indies, about 250 miles in length and 200 in breadth. The air is very good; the country full of mountains, but interspersed with fertile valleys; and it is remarkable for producing excellent cinnamon. In some places are rich mines of sapphires, rubies, topazes, and cats-eyes, besides other stones of less value. There is also plenty of wood for dyeing, and all other uses. The animals are cows, buffaloes, goats, hogs, tigers, monkeys, &c. They have large elephants, and monstrous serpents which are very dangerous. The island is also infested with ants, which do a great deal of mischief. It lies from E. Long. 78° to 82° and from N. Lat. 6° to 10°.

The conquest of this island was the first attempt of Albuquerque the celebrated Portuguese admiral. He found it well peopled, and inhabited by two different nations, the *Bedas* inhabiting the northern, and the *Cingalasses* who dwell in the southern parts. The former were very barbarous, but the latter a good deal more polished. Besides the advantages already mentioned, which these nations derived from their mines of precious stones, they carried on the greatest pearl-fishery in the East. These nations the Portuguese conquered, and tyrannized over in such a manner, that they afflicted the Dutch in expelling them from the island; and by their united efforts this was accomplished in 1658, after a bloody and obstinate war. All the Portuguese settlements fell into the hands of the Dutch East India company, who still keep possession of them, excepting a small district on the Eastern coast without any port, from whence the sovereign of the country had his salt. These settlements formed a regular track, extending from two to twelve leagues into the inland parts of the island. The company have appropriated all the productions of the island. The several articles of trade are, 1. Amethysts, sapphires, topazes, and rubies; the last are very small, and very indifferent. The Moors who come from the coast of Coromandel buy them, paying a moderate tax: and when they are cut, sell them at a low price in the different countries of India. 2. Pepper, which the company buy for about 4 d. *per* pound; coffee for which they only pay 2 d. and cardamom which has no

fixed price. These articles are all of an inferior quality, and through the indolence of the inhabitants will never turn to any account. 3. A hundred bales of handkerchiefs, pagnes, and gingham, of a fine red colour, which are fabricated by the Malabars at Jafnapatan. 4. A small quantity of ivory, and about 50 elephants, which are carried to the coast of Coromandel. 5. Areca, which the company buys at about 8 s. 9 d. the ammonian, and sells on the spot at L. 1, 13 s. to the merchants of Bengal, Coromandel, and the Maldives; who give in return rice, coarse linen, and cowries. 6. The pearl-fishery, which was formerly of great consequence; but is now so much exhausted as not to bring in more than L. 8,750 *per annum*. 7. After all, the great object of the company is cinnamon. They purchase the greatest part of their cinnamon of the Indians who are subject to them, and, all expences deducted, it does not cost them above 6 d. *per* pound. The annual expences of the colony may amount to about L. 96,250; their revenues and small branches of commerce produce only about L. 87,500. This deficiency must be supplied out of the profits arising from the cinnamon trade; and they are obliged to provide for the expences of the wars in which they are frequently engaged with the king of Candy, who is at present the sole sovereign of the island. These are very detrimental to the interests of the Hollanders; for which reason they endeavoured to engage the good will of this monarch by shewing him all imaginable civilities. The harmony, however, has been often interrupted. In a bloody war which terminated on the 14th of February 1766, the Ceylonese monarch was driven from his capital, so that the Dutch made a very advantageous treaty. Their sovereignty was acknowledged over all that part of the country they possessed before the troubles broke out; and that part of the coasts held by the natives was ceded to them. They were allowed to gather cinnamon in all the plains; and the court was to sell them the best sort which is produced in the mountains, at the rate of L. 1 : 16 : 1, for 18 *lb*. The government engaged to have no connection with any foreign power; and even to deliver up any Europeans who may happen to stray into the island. In return for so many concessions, the king was to receive annually the value of the produce of the ceded coasts; and from thence his subjects were to be furnished gratis with as much salt as they had occasion for. The Ceylonese are in the most miserable situation: they are in a state of total inactivity; live in huts without any furniture; and subsist upon fruits: those who are the most affluent have no other covering than a piece of coarse linen wrapt about their waist.

CHACE. See CHASE.

CHACO, a large country of South America situated between 19° and 37° S. Lat. It belongs to the Spaniards, by whom it was conquered in 1536. It is not naturally fruitful; but abounds in gold mines, which are so much the more valuable that they are easily worked. The works are carried on by about 8000 blacks, who deliver every day to their masters a certain quantity of gold; and what they can collect above this, belongs to themselves; as well as what they find on those days that are consecrated to religion and rest, upon

Chadchod
Chaffinch.

upon condition that during the festival they maintain themselves. This enables many of them to purchase their liberty; after which they intermarry with the Spaniards.

CHADCHOD, in Jewish antiquity. Ezekiel mentions *chadchod* among the several merchandizes which were brought to Tyre. The old interpreters, not very well knowing the meaning of this term, continued it in their translation. St Jerom acknowledges that he could not discover the interpretation of it. The Chaldee interprets it pearls; others think that the onyx, ruby, carbuncle, crystal, or diamond is meant by it.

CHÆROPHYLLUM, *CHERVIL*; a genus of the dignia order, belonging to the pentandria class of plants. There are seven species, two of which, called cow-weed, and wild chervil, are weeds common in many places of Britain. The roots of the first have been found poisonous when used as parsnips: the rundles afford an indifferent yellow dye; the leaves and stalks a beautiful green. Its preference indicates a fertile and grateful soil. It ought to be rooted out from all pastures early in the spring, as no animal but the ass will eat it. It is one of the most early plants in shooting, so that by the beginning of April the leaves are near two feet high. The leaves are recommended by Geoffroy as aperient and diuretic, and at the same time grateful to the palate and stomach. He even asserts, that dropsies which do not yield to this medicine can scarcely be cured by any other. He directs the juice to be given in the dose of three or four ounces every fourth hour, and continued for some time either alone, or in conjunction with nitre and syrup of the five opening roots.—The other species of *chærophyllum* are not possessed of any remarkable property.

CHÆTODON, in ichthyology, a genus of fishes belonging to the order of thioraci. The teeth are very numerous, thick, setaceous, and flexible; the rays of the gills are six. The back-fin and the fin at the anus are fleshy and squamous. There are 23 species, distinguished from each other principally by the figure of the tail, and the number of spines in the back-fin. The most remarkable is the rostratus, or shooting-fish, having a hollow, cylindrical beak. It is a native of the East Indies, where it frequents the sides of the sea and rivers in search of food, from its singular manner of obtaining which it receives its name. When it spies a fly sitting on the plants that grow in shallow water, it swims on to the distance of four, five, or six feet; and then, with a surprising dexterity, it ejects out of its tubular mouth a single drop of water, which never fails striking the fly into the water, where it soon becomes its prey.

CHAFERY, in the iron-works, the name of one of the two principal forges. The other is called the *finery*. When the iron has been brought at the finery into what is called an ancony, or square mass, hammered into a bar in its middle, but with its two ends rough, the business to be done at the chafery is the reducing the whole to the same shape, by hammering down these rough ends to the shape of the middle part.

CHAFFINCH, in ornithology, the English name of a species of FRINGILLA.

CHAGRE, a fort of America in the province of Darien at the mouth of a river of the same name. It has been taken several times by the bucaners, and last of all by Admiral Vernon in 1740. W. Long. 82. 7. N. Lat. 9. 50.

CHAIN, (*Gutena*), a series of several rings, or links, fitted into one another.

There are *chains* of divers matters, sizes, forms, and for divers uses.—Ports, rivers, streets, &c. are clothed with iron *chains*: rebellious cities are punished by taking away their *chains* and barriers.

The arms of the kingdom of Navarre are, *Chains Or, in a field Gules*. The occasion hereof is referred to the kings of Spain leagued against the Moors; who having gained a celebrated victory against them in 1212, in the distribution of the spoils the magnificent tent of Miralmunin fell to the king of Navarre, as being the first that broke and forced the *chains* thereof.

A *gold chain*, is one of the ornaments or badges of the dignity of the chief magistrates of a city, as the mayor of London, the provost and bailies of Edinburgh, &c.—Something like this obtained among the ancient Gauls: the principal ornament of their persons in power and authority was a gold *chain*, which they wore on all occasions; and even in battle, to distinguish them from the common soldiers.

CHAIN also denotes a kind of string, of twisted wire; serving to hang watches, tweezer-cases, and other valuable toys upon. The invention of this piece of curious work is owing to the English; whence, in foreign countries, it is denominated the *English chain*. These *chains* are usually either of silver or gold, some of gilt copper; the thread, or wire of each kind to be very fine.—For the fabric, or making of these *chains*: a part of the wire is folded into little links of an oval form; the longest diameter about three lines; the shortest, one. These, after they have been exactly folded, are again folded into two; and then bound together, or interwove, by means of several other little threads of the same thickness; some whereof, which pass from one end to the other, imitate the warp of a stuff; and the others, which pass tranverse, the woof. There are at least four thousand little links in a *chain* of four pendants; which are by this means bound so equally, and withal so firmly together, that the eye is deceived, and takes the whole to consist of one entire piece.

CHAIN is also a kind of measure in France, in the trade of wood for fuel. There are chains for wood by tale, for wood by the rope, for faggots, for cleft wood, and for round sticks. There are also chains for measuring the sheaves of all sorts of corn, particularly with regard to the payment of tithes; for measuring portles of hay, and for measuring horses. All these are divided into feet, inches, hands, &c. according to the use they are designed for.

CHAIN, in surveying, a measure of length, made of a certain number of links of iron-wire, serving to take the distance between two or more places.

Gunter's chain consists of 100 such links, each measuring $7\frac{1}{2}$ inches, and consequently equal to 66 feet, or four poles. See SURVEYING.

CHAIN-Pump. See PUMP.

CHAIN-Shot, two bullets with a chain between them.

Chain.
||
Chalcedony.
ny.

them. They are used at sea to shoot down yards or masts, and to cut the shrouds or rigging of a ship.

Top-CHAIN, on board a ship, a chain to sling the fail-yards in time of battle, in order to prevent them from falling down when the ropes by which they are hung happen to be shot away or rendered incapable of service.

CHAIN-WALES, or *Channels*, of a ship, *portebaisoirs*, are broad and thick planks projecting horizontally from the ship's outside, abreast of and somewhat behind the masts. They are formed to extend the shrouds from each other, and from the axis or middle line of the ship, so as to give a greater security and support to the masts, as well as to prevent the shrouds from damaging the gunwale, or being hurt by rubbing against it. Every mast has its chain-wales, which are either built above or below the second deck-ports in a ship of the line: they are strongly connected to the side by knees, bolts, and standards, besides being confined thereto by the chains whose upper ends pass through notches on the outer edge of the chain-wales, so as to unite with the shrouds above.

CHAINS, in ship-building, are strong links or plates of iron, the lower ends of which are bolted through the ship-side to the timbers.

CHAIN-Island, an island lately discovered by captain Wallis in the South-sea. It seemed to be about five miles long and as much broad, lying in the direction of north-west and south-east. It appeared to be a double range of woody islands joined together by reefs, so as to compose one island of an oval figure, with a lake in the middle. The trees are large; and from the smoke that issued from the woods, it appeared to be inhabited. V. Long. 145. 54. S. Lat. 17. 23.

CHAIR, (*Cathedra*), was anciently used for the pulpit, or fagellum, whence the priest spoke to the people. See *PULPIT*, and *CATHEDRA*.

It is still applied to the place whence professors and regents in universities deliver their lectures, and teach the sciences to their pupils: thus we say, the professor's chair, the doctor's chair, &c.

Curule CHAIR. See *CURULE*.

CHAIR is also applied by the Romanists to certain feasts, held anciently in commemoration of the translation of the fee or feat of the vicarage of Christ by St Peter.

The *perforated chair*, wherein the new-elected pope is placed, F. Mabillon observes, is still to be seen at Rome: but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but says there is a mystery in it; and it is intended, forsooth, to explain to the pope those words of scripture, that *God draws the poor from out of the dust and mire*.

Marine CHAIR. See *MARINE CHAIR*.

CHAISE, a fort of light open chariot or calash.

See *CHARIOT*.

CHALAZA, among naturalists, a white knotty sort of string at each end of an egg, formed of a plexus of the fibres of the membranes, whereby the yolk and white are connected together. See *EGG*.

CHALCEDONY, in natural history, a genus of the semipellucid gems: they are of an even and regular, not tabulated structure; of a semi-opaque crystal-

line basis; and variegated with different colours, but those ever diffused in form of mists or clouds, and, if nicely examined, found to be owing to an admixture of various coloured earths, but imperfectly blended in the mists, and often visible in distinct molecules.—It has been doubted by some whether the ancients were at all acquainted with the stone we call *chalcedony*; they having described a Chalcedonian carbuncle and emerald, neither of which can at all agree with the characters of our stone; but we are to consider that they have also described a Chalcedonian jasper which seems to have been the very same stone, as they describe by the word *turbida*, which extremely well agrees with our *chalcedony*.

There are four known species of the *chalcedony*.

1. A bluish white one. This is the most common of all, and is found in the shape of our flints and pebbles, in masses of two or three inches or more in diameter: it is of a whitish colour, with a faint cloud of blue diffused all over it, but always in the greatest degree near the surface. This is a little less hard than the oriental onyx. The oriental chalcedonies are the only ones of any value; they are found in vast abundance on the shores of rivers in all parts of the East Indies, and frequently come over among the balaft of the East-India ships. They are common in Silesia and Bohemia, and other parts of Europe also; but with us are less hard, more opaque, and of very little value. 2. The dull milky-veined *chalcedony*. This is a stone of little value; and is sometimes met with among our lapidaries, who mistake it for a kind of nephritic stone. It is of a somewhat yellowish white or cream colour, with a few milk-white veins. This is principally found in New-Spain. 3. The third is a brownish, black, dull, and cloudy one, known to the ancients by the name of smoky jasper, or jaspis capnitis. This is the least beautiful stone of all the class; it is of a pale brownish white, clouded all over with a blackish mist, as the common *chalcedony* is with a blue. It is common both in the East and West Indies, and in Germany; but is very little valued, and is seldom worked into any thing better than the handles of knives. 4. The yellow and red *chalcedony* is greatly superior to all the rest in beauty; and is in great repute in Italy, though very little known among us. It is naturally composed of an admixture of red and yellow only, on a clouded crystalline basis; but is sometimes blended with the matter of common *chalcedony*, and then is mixed with blue. It is all over of the misty hue of the common *chalcedony*. This is found only in the East-Indies, and there not plentifully. The Italians make it into beads, and call these *castidones*; but they are not determinate in the use of the word, but call beads of several of the agates by the same name.—All the *chalcedonies* readily give fire with steel, and make no effervescence with aquafortis.

CHALCIDIUS, a famous platonic philosopher, in the third century, who wrote a commentary, which is esteemed, on the *Timæus* of Plato. This work has been translated from the Greek into Latin.

CHALCONDYLAS (*Demetrius*), a learned Greek, born at Constantinople, left that city after its being taken by the Turks, and afterwards taught Greek in several

Chalcidius
|
Chalcondylas.

Chalcondylas several cities in Italy. He composed a Greek grammar; and died at Milan in 1513.

CHALCONDYLAS (Laonicus), a famous Greek historian of the fifteenth century, was born at Athens; and wrote an excellent history of the Turks, from Ottoman, who reigned about the year 1300, to Mahomet II. in 1463.

CHALDÆA, or **BABYLONIA**, the name of an ancient kingdom of Asia, now called Eyrac Arabi. See **BABYLONIA**.

CHALDEE LANGUAGE, that spoken by the Chaldeans, or people of Chaldæa. It is a dialect of the HEBREW.

CHALDRON, a dry English measure, consisting of thirty-six bushels, heaped up according to the seal-bushel kept at Guild-hall, London: but on ship-board, twenty-one chaldron of coals are allowed to the score. The chaldron should weigh two thousand pounds.

CHALICE, the cup or vessel used to administer the wine in the sacrament; and by the Roman catholics in the mass.

The use of the chalice, or communicating in both kinds, is, by the church of Rome, denied to the laity, who communicate only in one kind, the clergy alone being allowed the privilege of communicating in both kinds.

CHALK, *Creta*, is a white earth found plentifully in Britain, France, Norway, and other parts of Europe; said to have been anciently dug chiefly in the island of Crete, and thence to have received its name of Creta. They have a very easy way of digging chalk in the county of Kent in England. It is there found on the sides of hills; and the workmen undermine it so far as appears proper; then digging a trench at the top as far distant from the edge as the undermining goes at bottom, they fill this with water, which soaks through in the space of a night, upon which the whole flake falls down at once. In other parts of the kingdom, chalk generally lies deeper, and they are forced to dig for it at considerable depths, and draw it up in buckets.

Chalk is of two kinds; hard, dry, and firm, or soft and unctuous; both of which are adapted to various purposes. The hard and dry kind is much the properest for burning into lime; but the soft and unctuous chalk is best for using as a manure for lands. Chalk, whether burnt into lime or not, is in some cases an excellent manure. Its mode of operating on the soil, is explained under the article **AGRICULTURE**, n° 21.

Pure chalk melts easily with alcali and flint into a transparent colourless glass. With alkaline salts it melts somewhat more difficultly; and with borax somewhat more easily than with flint or sand. It requires about half its weight of borax, and its whole weight of alcali, to fuse it. Sal mirabile, and sandiver, which do not vitrify at all with the crystalline earths, form, with half their weight of chalk, the first a yellowish black, the latter a greenish, glass. Nitre, on the other hand, one of the most active fluxes for flint, does not perfectly vitrify with chalk. This earth notably promotes the vitrification of flint; a mixture of the two requiring less alcali than either of them

separately. If glass made from flint and alcali is further saturated with the flint, so as to be incapable of bearing any further addition of that earth without becoming opaque and milky, it will still in a strong fire take up a considerable proportion, one-third or one-fourth of its weight of chalk, without injury to its transparency; hence chalk is sometimes made use of in compositions for glass, as a part of the salt may then be spared. Chalk likewise has a great effect in melting the stony matters intermixed with metallic ores, and hence might be of use in smelting ores; as indeed limestone is used for that purpose. But it is remarkable, that chalk, when deprived of its fixed air, and converted into limestone, loses much of its disposition to vitrify. It is then found to melt very difficultly and imperfectly, and to render the glass opaque and milky.

Chalk readily imbibes water; and hence masses of it are employed for drying precipitates, lakes, earthy powders that have been levigated with water and other moist preparations. Its economical uses in cleaning and polishing metalline or glass utensils are well known. In this case it is powdered and washed from any gritty matter it may contain, and is then called *whiting*. In medicine it is one of the most useful absorbents, and is to be looked upon simply as such: the astringent virtues which some have attributed to it have no foundation, unless in as far as the earth is saturated with an acid, with which it composes a saline concrete manifestly sub-astringent. For the further properties of chalk, see **CHEMISTRY**, n° 33, 127, 191, 234, 277, 342.

Black CHALK, a name given by painters to a species of earth with which they draw on blue paper, &c. It is found in the earth in pieces from two to ten feet long, and from four inches to 20 in breadth, generally flat, but somewhat rising in the middle, and thinner towards the edges, commonly lying in large quantities together. While in the earth, it is moist and flaky; but being dried, it becomes considerably hard and very light; but always breaks in some particular direction; and if attentively examined when fresh broken, appears of a striated texture. To the touch it is soft and smooth, stains very freely, and by virtue of its smoothness makes very neat marks. It is easily reduced into an impalpable soft powder, without any diminution of its blackness: In this state it mixes easily with oil into a smooth paste; and being diffused through water, it slowly settles in a black slimy or muddy form; properties which make its use very convenient to the painters both in oil and water colours. It appears to be an earth quite different from common chalk, and rather of the slaty bituminous kind. In the fire it becomes white with a reddish cast, and very friable, retaining its flaky structure, and looking much like the white flaky masses which some sorts of pit-coal leave in burning. Neither the chalk nor these allies are at all affected by acids.

The colour-shops are supplied with this earth from Italy or Germany; though some parts of England afford substances nearly, if not entirely, of the same quality, and which are found to be equally serviceable both for marking and as black paints. Such particularly is the black earth called *killow*, said by Dr Merret

Chalk in his *Pinax Rerum Britannicarum*, to be found in Lancashire; and by Mr Da Costa, in his history of fossils, to be plentiful on the side near the top of Cay-Avon, an high hill in Merioneth-shire.

Challenge.

Red Chalk, an earth much used by painters and artificers, and common in the colour-shops. It is properly an indurated clayey ochre; and is dug in Germany, Italy, Spain, and France, but in greatest quantity in Flanders. It is of a fine, even, and firm texture; very heavy, and very hard; of a pale red on the outside, but of a deep dusky chocolate colour within. It adheres firmly to the tongue, is perfectly insipid to the taste, and makes no effervescence with acids.

Chalk-Land. Barley and wheat will succeed very well on the better sort of chalky land, and oats generally do well on any kind of it. The natural produce of this sort of land in weeds, is that sort of small vetch called the *tine-tare*, with poppies, may-weed, &c. Saint-foin and hop-clover will generally succeed tolerably well on these lands; and, where they are of the better sort, the great clover will do. The best manure is dung, old rags, and the sheep-dung left after folding them on it.

Chalk-Stones, in medicine, signify the concretions of calcareous matter in the hands and feet of people violently afflicted with the gout. Lewenhoeck has been at the pains of examining these by the microscope. He divides them into three parts. The first is composed of various small parcels of matter looking like white grains of sand; this is harder and drier, and also whiter, than the rest. When examined with large magnifiers, these are found to be composed of oblong particles laid closely and evenly together; though the whole small stones are opaque, these component parts of them are pellucid, and resemble pieces of horse-hair cut short, only that they are somewhat pointed at both ends. These are so extremely thin, that Mr Lewenhoeck computes that 1000 of them placed together would not amount to the size of one hair of our heads. The whole stones in this harder part of the chalk are not composed of these particles, but there are confusedly thrown in among them some broken parts of other substances, and in a few places some globules of blood and small remains of other juices. The second kind of chalky matter is less hard and less white than the former, and is composed of fragments or irregular parts of those oblong bodies which compose the first or hardest kind, and these are mixed among tough and clear matter, interspersed with the small broken globules of blood discoverable in the former, but in much greater quantity. The third kind appears red to the naked eye; and, when examined with glasses, is found to be a more tough and clammy white matter, in which a great number of globules of blood are interspersed; these give it the red appearance it has.

CHALLENGE, a cartel or invitation to a duel or other combat*. A challenge either by word or letter, or to be the bearer of such challenge, is punishable by fine and imprisonment on indictment or information.

CHALLENGE, among hunters. When hounds or beagles, at first finding the scent of their game, presently open and cry, they are said to challenge.

CHALLENGE, in the law of England, is an exception made to jurors*; and is either in civil or criminal cases.

Challenge.

* See the article Trial.

I. In civil cases challenges are of two sorts; challenges to the array, and challenges to the poll.

I. Challenges to the array are at once an exception *Blackstone's* to the whole panel, in which the jury are arrayed, or *Comment.*

set in order by the sheriff in his return; and they may be made upon account of partiality or some default in the sheriff or his under officer who arrayed the panel. Also, though there be no personal objection against the sheriff, yet if he arrays the panel at the nomination, or under the direction of either party, this is good cause of challenge to the array. Formerly if a lord of parliament had a cause to be tried, and no knight was returned upon the jury, it was a cause of challenge to the array: also by the policy of the ancient law, the jury was to come *de vicineto*, from the neighbourhood of the vill or place where the cause of action was laid in the declaration: and therefore some of the jury were obliged to be returned from the hundred in which such vill lay; and, if none were returned, the array might be challenged from defect of hundreders. For, living in the neighbourhood, these were supposed to know beforehand the characters of the parties and witnesses; and therefore they better knew what credit to give to the facts alleged in evidence. But this convenience was overbalanced by another very natural and almost unavoidable inconvenience; that jurors coming out of the immediate neighbourhood, would be apt to intermix their prejudices and partialities in the trial of right. And this the law was so sensible of, that it for a long time has been gradually relinquishing this practice; the number of necessary hundreders in the whole panel, which in the reign of Edward III. were constantly six, being in the time of Fortescue reduced to four; afterwards by statute 27 Eliz. c. 6. to two; and at length, by statute 4 and 5 Anne, c. 16. it was entirely abolished upon all civil actions, except upon penal statutes; and upon those also by the 24 Geo. II c. 18. the jury being now only to come *de corpore communitatis*, from the body of the county at large, and not *de vicineto*, or from the particular neighbourhood. The array by the ancient law may also be challenged, if an alien be party to the suit, and, upon a rule obtained by his motion to the court for a jury *de medietate lingue*, such a one be not returned by the sheriff pursuant to the statute 25 Edward III. c. 13. enforced by 8 Hen. VI. c. 29. which enact, that where either party is an alien born, the jury shall be one half denizens and the other aliens, (if so many be forthcoming in the place), for the more impartial trial: A privilege indulged to strangers in no other country in the world; but which is as ancient in England as the time of king Ethelred, in whose statute *de monticulis Wallie*, (then aliens to the crown of England) c. 3. it is ordained, that "duodeni legales homines, quorum sex Walli et sex Angli erunt, Anglis et Wallis jus dicunt."

2. Challenges to the polls, *in capita*, are exceptions to particular jurors; and seem to answer the *recusatio judicis* in the civil and canon laws; by the constitutions of which, a judge might be refused upon any suspicion.

Challenge.

spicion of partiality. By the laws of England also, in the times of Bracon and Fleta, a judge might be refused for good cause; but now the law is otherwise, and it is held that judges or justices cannot be challenged. For the law will not suppose a possibility of bias or favour in a judge who is already sworn to administer impartial justice, and whose authority greatly depends on that presumption and idea. And, should the fact at any time prove flagrantly such, as the delicacy of the law will not presume beforehand, there is no doubt but that such misbehaviour would draw down a heavy censure from those to whom the judge is accountable for his conduct. But challenges to the polls of the jury (who are judges of fact) are reduced to four heads by Sir Edward Coke: *propter honoris respectum; propter defectum; propter affectum; and propter delictum*. 1. *Propter honoris respectum*; as, if a lord of parliament be impanelled on a jury, he may be challenged by either party, or he may challenge himself. 2. *Propter defectum*; as, if a jurymen be an alien born, this is defect of birth; if he be a slave or bondman, this is defect of liberty, and he cannot be a *liber et legalis homo*. Under the word *homo* also, though a name common to both sexes, the female is however excluded, *propter defectum sexus*: except when a widow feigns herself with child in order to exclude the next heir, and a supposititious birth is suspected to be intended; then, upon the writ *de ventre inspiciendo*, a jury of women is to be impanelled to try the question whether with child or not. But the principal deficiency is defect of estate sufficient to qualify him to be a juror, which depends upon a variety of statutes*. 3. Jurors may be challenged *propter affectum*, for suspicion of bias or partiality. This may be either a principal challenge, or to the favour. A principal challenge is such, where the cause assigned carries with it, *prima facie*, evident marks of suspicion either of malice or favour; as, that a juror is of kin to either party within the ninth degree; that he has an interest in the cause; that there is an action depending between him and the party; that he has taken money for his verdict, &c. which, if true, cannot be overruled, for jurors must be *omni exceptione majores*. Challenges to the favour, are where the party hath no principal challenge; but objects only some probable circumstances of suspicion, as acquaintance, and the like; the validity of which must be left to the determination of *triori*, whose office it is to decide whether the juror be favourable or unfavourable. 4. Challenges *propter delictum*, are for some crime or misdemeanour that affects the juror's credit, and renders him infamous: As for a conviction of treason, felony, perjury, or conspiracy; or if, for some infamous offence, he hath received judgment of the pillory or the like.

II. In criminal cases, challenges may be made either on the part of the king, or on that of the prisoner; and either to the whole array, or to the separate polls, for the very same reasons that they may be in civil causes. For it is here at least as necessary as there, that the sheriff or returning officer be totally indifferent; that, where an alien is indicted, the jury should be *de medietate*, or half foreigners, if so many are found in the place (which does not indeed hold in treasons, aliens being very improper judges of the

breach of allegiance; nor yet in the case of Egyptians under the statute 22 Hen. VIII. c. 10.) that on every panel there should be a competent number of hundreds; and that the particular jurors should be *omni exceptione majores*, not liable to objections either *propter honoris respectum, propter defectum, propter affectum, or propter delictum*.

Challenges on any of the foregoing accounts are styled challenges *for cause*; which may be without stint in both civil and criminal trials. But in criminal cases, or at least in capital ones, there is, *in favorem vite*, allowed to the prisoner an arbitrary and capricious species of challenge to a certain number of jurors, without shewing any cause at all; which is called a peremptory challenge: a provision full of that tenderness and humanity to prisoners for which our laws are justly famous. This is grounded on two reasons: 1. As every one must be sensible what sudden impressions and unaccountable prejudices we are apt to conceive upon the bare looks and gestures of another; and how necessary it is, that a prisoner, when put to defend his life, should have a good opinion of his jury, the want of which might totally disconcert him; the law wills not that he should be tried by any one man against whom he has conceived a prejudice even without being able to assign a reason for such his dislike. 2. Because upon challenges for cause shewn, if the reason assigned prove insufficient to set aside the juror, perhaps the bare questioning his indifference may sometimes provoke a resentment; to prevent all ill consequences from which, the prisoner is still at liberty, if he pleases, peremptorily to set him aside.

This privilege of peremptory challenges, though granted to the prisoner, is denied to the king by the statute 33 Edward I. stat. 4. which enacts, that the king shall challenge no jurors without assigning a cause certain to be tried and approved by the court. However, it is held that the king need not assign his cause of challenge, till all the panel is gone through, and unless there cannot be a full jury without the persons so challenged. And then, and not sooner, the king's counsel must shew the cause: otherwise the juror shall be sworn.

The peremptory challenges of the prisoner must, however, have some reasonable boundary; otherwise he might never be tried. This reasonable boundary is settled by the common law to be the number of 35; that is, one under the number of three full juries. For the law judges, that 35 are fully sufficient to allow the most timorous man to challenge through mere caprice; and that he who peremptorily challenges a greater number, or three full juries, has no intention to be tried at all. And therefore it deals with one who peremptorily challenges above 35, and will not retract his challenge, as with one who stands mute or refuses his trial; by sentencing him to the *peine forte et dure* in felony, and by attainting him in treason. And so the law stands at this day with regard to treason of any kind. But by statute 22 Hen. VIII. c. 14. (which, with regard to felonies, stands unrepealed), no person arraigned for felony can be admitted to make more than 20 peremptory challenges.

CHALLON-SUR-SAONE, an ancient town of France, in Burgundy, and capital of the Chalonnois,

Challenge.

Challons-
sur-Marne
|
Chaloner.

with a citadel and bishop's fee. It is seated on the river Saone, in E. Long. 5. 7. N. Lat. 46. 47.

CHALLONS-sur-Marne, a large episcopal town of France, in Champagne. It carries on a considerable trade in shallons, and other woollen stuffs. It is seated between two fine meadows on the rivers Marne, Mau, and Nau, in E. Long. 4. 37. N. Lat. 48. 57.

CHALONER (Sir Thomas), a statesman, soldier, and poet, descended from a good family in Denbigh in Wales, was born at London about the year 1515. Having been educated in both universities, but chiefly at Cambridge, he was introduced at the court of Henry VIII. who sent him abroad in the retinue of Sir Henry Knevet ambassador to Charles V. and he had the honour to attend that monarch on his fatal expedition against Algiers in 1541*. Soon after the fleet left that place, he was shipwrecked on the coast of Barbary in a very dark night: and having exhausted his strength by swimming, he chanced to strike his head against a cable, which he had the presence of mind to catch hold of with his teeth; and, with the loss of several of them, was drawn up by it into the ship to which he belonged. Mr Chaloner returned soon after to England, and was appointed first clerk of the council, which office he held during the rest of that reign. On the accession of Edward VI. he became a favourite of the Duke of Somerset, whom he attended to Scotland, and was knighted by that nobleman after the battle of Muffelburgh, in 1547. The protector's fall put a stop to Sir Thomas Chaloner's expectations, and involved him in difficulties. During the reign of queen Mary, being a determined protestant, he was in some danger; but having many powerful friends, he had the good fortune to escape. On the accession of queen Elizabeth, he appeared again at court; and was so immediately distinguished by her majesty, that she appointed him ambassador to the emperor Ferdinand I. being the first ambassador she nominated. His commission was of great importance; and the queen was so well satisfied with his conduct, that, soon after his return, she sent him in the same capacity to Spain: but Sir Thomas was by no means satisfied with this instance of her majesty's confidence: the courts of England and Spain being at this time extremely dissatisfied with each other, he foresaw that his situation would be very disagreeable; and so it proved; but Elizabeth must be obeyed. He embarked for Spain in 1561, and returned to London in 1564, in consequence of a request to his sovereign, in an elegy written in imitation of Ovid. After his return, he resided in a house built by himself in Clerkenwell-clofe, where he died in the year 1565, and was buried in St Paul's. Sir William Cecil assisted as chief mourner at his funeral.

So various were the talents of Sir Thomas Chaloner, that he excelled in every thing to which he applied

himself. He made a considerable figure as a poet. His poetical works were published, by William Malim, master of St Paul's school, in 1579. His capital work was that "Of restoring the English republic, in ten books," which he wrote when he was ambassador in Spain. It is remarkable, that this great man, who knew how to transact as well as write upon the most important affairs of states and kingdoms, could descend to compose a *dictionary for children*, and to translate from the Latin a book *Of the office of servants*, merely for the utility of the subjects.

CHALONER (Sir Thomas) the younger, though inconsiderable as an author, deserves to be recorded as a skilful naturalist, in an age wherein natural history was very little understood in this or any other country; and particularly as the founder of the alum-works in Yorkshire, which have since proved so exceedingly advantageous to the commerce of this kingdom. He was the only son of Sir Thomas Chaloner mentioned in the last article, and was born in the year 1559. Being very young at the time of his father's death, the lord treasurer Burleigh taking charge of his education, sent him to St Paul's school, and afterwards to Magdalen college in Oxford, where, like his father, he discovered extraordinary talents for Latin and English poetry. About the year 1580, he made the tour of Europe, and returned to England before 1584, for, in that year, we find him a frequent attendant in the court of queen Elizabeth. About this time he married the daughter of Sir William Fleetwood, recorder of London. In 1591 he was knighted; and, some time after, discovered the alum-mines on his estate at Gilsborough, near the river Tees in Yorkshire†.

Towards the latter end of the queen's reign, Sir Thomas visited Scotland; and returning to England in the retinue of king James I. found such favour in the sight of his majesty, that he was immediately appointed governor to prince Henry, whom he constantly attended, and, when his royal pupil visited Oxford, was honoured with the degree of master of arts. How he was employed after the death of the prince is not known. Some years before that event, he married a second wife, the daughter of Mr William Blount of London, by whom he had some children. He died in the year 1615, and was buried at Chiswick in Middlesex. His eldest son William was created a baronet in the 18th of James anno 1620. The title was extinct in 1681. He wrote, 1. *Dedication to lord Burleigh of his father's poetical works*, dated 1579. 2. *The virtue of nitre*, wherein is declared the sundry cures by the same effected. Lond. 1584, 4to.

CHALYBEAT, in medicine, an appellation given to any liquid, as wine or water, impregnated with particles of iron or steel.

Dr Monro, professor of anatomy at Edinburgh, by pouring a tincture of galls into common water, and dissolving

Chaloner
|
Chalybeat

* See *Algiers*, n^o 14.
—20.

† Sir Thomas, during his residence in Italy, being particularly fond of natural history, spent some time at Puzoli, where he was very attentive to the art of producing alum. This attention proved infinitely serviceable to his country, though of no great benefit to himself or family; his attempt being attended with much difficulty and expence. It was begun about the year 1600, in the reign of queen Elizabeth; but was not brought to any degree of perfection till some time in the reign of Charles I. by the assistance of one Ruffel a Walloon, and two other workmen brought from the alum-works at Rochelle. By one of the arbitrary acts of Charles, it was then deemed a mine royal, and granted to Sir Paul Pindar. The long parliament adjudged it a monopoly, and justly restored it to the original proprietors.

Chalybeated dissolving therein a small quantity of sal martis, adding some filing of iron, and oil of vitrol, procured a water exactly like the natural chalybeate water; and he is of opinion, that where these are not to be had, the artificial water may be made to answer all their intentions, according to its being more or less closely kept, or exposed in the air or heat, &c.

CHALYBEATED TARTAR. See **CHEMISTRY**, n^o 299.

CHAM, or **KHAN**, a word of much the same import with *king* in English: It is the title of the sovereign princes of Tartary, and is likewise applied to the principal noblemen in Persia.

CHAM, in geography, a town of the Bavarian palatinate, situated on a river of the same name, about 25 miles north-east of Ratibon; E. Long. 13. N. Lat. 49. 15.

CHAMA, in zoology, a genus of shell-fish belonging to the order of vermes testacea. The shell is thick, and has two valves; it is an animal of the oyster kind. Linnaeus enumerates 14 species, principally distinguished by the figure of their shells.

CHAMADE, in war, a certain beat of a drum, or sound of a trumpet, which is given the enemy as a signal to inform them of some proposition to be made to the commander, either to capitulate, to have leave to bury their dead, make a truce, or the like.——Menage derives the word from the Italian *chiamata*, or *clamare* to “cry.”

CHAMÆDRYS, in botany. See **VERONICA**.

CHAMÆLEON, in zoology, the trivial name of a species of **LACERTA**.

CHAMÆPITYS, in botany. See **TEUCRIUM**.

CHAMÆROPS, DWARF PALM, or PALMETTO; a genus of the palmæ flabellifoliz of Linnaeus. There are two species, the most remarkable of which is the glabra, a native of the West Indies, and warm parts of America, also of the corresponding latitudes of Asia and Africa. It never rises with a tall stem; but when the plants are old, their leaves are five or six feet long, and upwards of two feet broad; these spread open like a fan, having many foldings, and at the top are deeply divided like the fingers of a hand. This plant the Americans call *thatch*, from the use to which the leaves are applied.—Under the name of palmetto, however, Mr Adanson describes a species of palm which grows naturally at Senegal, whose trunk rises from 50 to 60 feet in height: from the upper end of the trunk issues a bundle of leaves, which, in turning off, form a round head; each leaf represents a fan of five or six feet in expansion, supported by a tail of the same length. Of these trees, some produce male flowers, which are consequently barren; others are female, and loaded with fruit, which succeed each other uninterruptedly almost the whole year round. The fruit of the large palmettos, Mr Adanson affirms to be of the bigness of an ordinary melon, but rounder: it is enveloped in two skins as tough as leather, and as thick as strong parchment; within the fruit is yellowish, and full of filaments fastened to three large kernels in the middle. The negroes are very fond of this fruit, which, when baked under the ashes, is said to taste like a quince.

The little palmetto may be easily raised in this country from seeds brought from America; but, as

the plants are tender, they must be constantly kept in a bark-stove.

CHAMANIM, in the Jewish antiquities, is the Hebrew name for that which the Greeks call *Pyreia* or *Pyrateria*; and St Jerom in Leviticus has translated *Simulachra*, in Isaiah, *d. labra* *. These chamanim were, according to Rabbi Solomon, idols exposed to the sun upon the tops of houses. Abenezra says they were portable chapels or temples made in the form of chariots, in honour of the sun. What the Greeks call *Pyreia*, were temples consecrated to the sun and fire, wherein a perpetual fire was kept up. They were built upon eminences; and were large inclosures without covering, where the sun was worshipped. The Guebres, or worshippers of fire, in Persia and the East Indies, have still these *Pyreia*. The word *chamanim* is derived from *Chaman*, which signifies to warm, or burn.

CHAMARIM, a word which occurs in several places of the Hebrew bible, and is generally translated the *priests of the idols*, or the *priests clothed in black*, because *chamar* signifies “black,” or “blackness.” St Jerom in the second book of Kings†, renders it *aruspices*. In Hosea and Zephaniah‡, he translates it *adui* or church-wardens. But the best commentators are of opinion, that by this word we are to understand the priests of the false gods, and in particular the worshippers of fire; because they were, as they say, dressed in black; or perhaps the Hebrews gave them this name in derision, because as they were continually employed in taking care about the fowel, and keeping up the fire, they were always as black as smiths or colliers. We find priests, among those of Isis, called *melanchori*, that is to say, that wear black; but whether this may be by reason of their dressing in black, or whether it were because they wore a certain shining black veil in the processions of this goddess, is not certain. *Gamar*, in Arabic, signifies the “moon.” Isis is the same deity. Grotius thinks the Roman priests, called *camilli*, came from the Hebrew *chamarim*. Those among the heathens who sacrificed to the infernal gods were dressed in black.

CHAMBER, in building, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in; and called by the Latins *cubiculum*. The word comes from the Latin *camera*; and that, according to Nicod, from the Greek *καμαρα*, *vault* or *curve*; the term *chamber* being originally confined to places arched over.

A complete apartment is to consist of a hall, anti-chamber, *chamber*, and cabinet.

Privy-CHAMBER. Gentlemen of the privy-chamber, are servants of the king, who are to wait and attend on him and the queen at court, in their diversions, &c. Their number is forty-eight under the lord-chamberlain, twelve of whom are in quarterly waiting, and two of these lie in the privy-chamber.

In the absence of the lord-chamberlain, or vice-chamberlain, they execute the king's orders: at coronations, two of them personate the dukes of Aquitaine and Normandy; and six of them, appointed by the lord-chamberlain, attend ambassadors from crowned heads to their audiences, and in public entries. The gentlemen of the privy-chamber were instituted by Henry VII.

Chamber.

CHAMBER, in policy, the place where certain assemblies are held, also the assemblies themselves. Of these some are established for the administration of justice, others for commercial affairs.

Of the first kind are, 1. Star-chamber, so called, because the roof was painted with stars; the authority, power and jurisdiction of which are absolutely abolished by the statute 17, Car. 1. 2. Imperial chamber of Spire, the supreme court of judicatory in the empire, erected by Maximilian I. This chamber has a right of judging by appeal; and is the last resort of all civil affairs of the states and subjects of the empire, in the same manner as the aulic council of Vienna. Nevertheless it is restrained in several cases: it takes no notice of matrimonial causes, these being left to the pope; nor of criminal causes, which either belong to particular princes or towns in their respective territories, or are cognizable by all the states of the empire in a diet. By the treaty of Osnaburg, in 1648, fifty assessors were appointed for this chamber, whereof twenty-four were to be Protestants, and twenty-six Catholics; besides five presidents, two of them Protestants, and the rest Catholics. 3. Chamber of accounts, a sovereign court in France, where accounts are rendered of all the king's revenues, inventories, and avowals thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. There are nine in France, that of Paris is the chief; it registers proclamations, treaties of peace, naturalizations, titles of nobility, &c. All the members wear long black gowns of velvet, of sattin, or damask, according to their places. 4. Ecclesiastical chambers in France, which judge by appeal of differences about collecting the tithes. 5. Chamber of audience, or grand chamber, a jurisdiction in each parliament of France, the counsellors of which are called *juges*, or judges, as those of the chamber of inquests are called *rapportheurs*, reporters of processes by writing. 6. Chamber of the edict, or miparty, a court established by virtue of the edict of pacification in favour of those of the reformed religion. This chamber is now suppressed. 7. Apostolical chamber of Rome, that wherein affairs relating to the revenues of the church and the pope are transacted. This council consists of the cardinal-camerlingo, the governor of the rota, a treasurer, an auditor, a president, one advocate-general, a solicitor-general, a commissary, and 12 clerks. 8. Chamber of London, an apartment in Guildhall, where the city-money is deposited.

Of the last sort are, 1. The chambers of commerce. 2. The chambers of affluance. And, 3. The royal or syndical chamber of bookfellers in France.

The chamber of commerce is an assembly of merchants and traders, where the affairs relating to trade are treated of. There are several established in most of the chief cities of France; and in our own country, we have lately seen chambers of this kind erected for carrying on the British herring-fishery. Chamber of affluance in France, denotes a society of merchants and others for carrying on the business of insuring; but in Holland, it signifies a court of justice, where causes relating to insurances are tried. Chamber of bookfellers in Paris, an assembly consisting of a syndic and assistants, elected by four delegates from the prin-

ters, and twelve from the bookfellers, to visit the books imported from abroad, and to search the houses of fellers of marbled paper, printfellers, and dealers in printed paper for hangings, who are prohibited from keeping any letters proper for printing books. In the visitation of books, which ought to be performed by three persons at least from among the syndic and assistants, all libels against the honour of God and the welfare of the state, and all books printed either within or without the kingdom in breach of their regulations and privileges, are swept, even with the merchandises that may happen to be in the bales with such libels or other prohibited books. The days appointed for this chamber to meet, are Tuesdays and Fridays, at two o'clock in the afternoon.

CHAMBER, in military affairs. 1. Powder-chamber, or bomb-chamber; a place sunk under ground for holding the powder, or bombs, where they may be out of danger, and secured from the rain. 2. Chamber of a mine; the place, most commonly of a cubical form, where the powder is confined. 3. Chamber of a mortar; that part of the chase, much narrower than the rest of the cylinder, where the powder lies. It is of different forms; sometimes like a reversed cone; sometimes globular, with a neck for its communication with the cylinder, whence it is called a bottled chamber; but most commonly cylindrical, that being the form which is found by experience to carry the ball to the greatest distance.

CHAMBERLAIN, an officer charged with the management and direction of a chamber. See CHAMBER, in policy.

There are almost as many kinds of chamberlains as chambers, the principal whereof are as follows.

Lord CHAMBERLAIN of Great Britain, the sixth great officer of the crown; to whom belongs lively and lodging in the king's court; and there are certain fees due to him from each archbishop or bishop when they perform their homage to the king, and from all peers at their creation or doing their homage. At the coronation of every king, he is to have forty ells of crimson velvet for his own robes. This officer, on the coronation-day, is to bring the king his shirt, coif, and wearing cloths; and after the king is dressed, he claims his bed, and all the furniture of his chamber, for his fees: he also carries at the coronation, the coif, gloves, and linen, to be used by the king on that occasion; also the sword and scabbard, the gold to be offered by the king, and the robes-royal and crown: he dresses and undresses the king on that day, waits on him before and after dinner, &c.

To this officer belongs the care of providing all things in the house of lords, in the time of parliament; to him also belongs the government of the palace of Westminster: he disposes likewise of the sword of state, to be carried before the king, to what lord he pleases.

Lord CHAMBERLAIN of the Household, an officer who has the oversight and direction of all officers belonging to the king's chambers, except the precinct of the king's bed-chamber.

He has the oversight of the officers of the wardrobe at all his majesty's houses, and of the removing wardrobes, or of beds, tents, revels, music, comedians, hunting,

Chamber

Chamber-lain.

hunting, messengers, &c. retained in the king's service. He moreover has the oversight and direction of the serjeants at arms, of all physicians, apothecaries, surgeons, barbers, the king's chaplain, &c. and administers the oath to all officers above stairs.

Other chamberlains, are those of the king's court of exchequer, of North Wales, of Chester, of the city of London, &c. in which cases this officer is generally the receiver of all rents and revenues belonging to the place whereof he is chamberlain.

In the exchequer there are two chamberlains, who keep a controulment of the pells of receipts and exits, and have certain keys of the treasury, records, &c.

CHAMBERLAIN of London keeps the city money, which is laid up in the chamber of London: he also presides over the affairs of masters and apprentices, and makes free of the city, &c.

His office lasts only a year; but the custom usually obtains to re-chule the same person, unless charged with any misdemeanour in his office.

CHAMBERLAYNE (Edward), descended from an ancient family, was born in Gloucestershire 1616, and made the tour of Europe during the distractions of the civil war. After the restoration, he went as secretary with the earl of Carlisle, who carried the order of the Garter to the king of Sweden; was appointed tutor to the duke of Grafton, natural son of Charles II. and was afterwards pitched on to instruct prince George of Denmark in the English tongue. He died in 1703, and was buried in a vault in Chelsea churchyard: his monumental inscription mentions six books of his writing; and that he was so desirous of doing service to posterity, that he ordered some copies of his books to be covered with wax, and buried with him. That work by which he is best known, is his *Anglæ Notitiæ, or the Present State of England*, which has been often since printed.

CHAMBERRY, a considerable and populous town of Italy, in Savoy, with a castle. It is capital of the duchy, and well built, but has no fortifications. It is watered by several streams, which have their sources in St Martin's-hill, and run through several of the streets. There are piazzas under most part of the houses, where people may walk dry in the worst weather. It hath large and handsome suburbs; and in the center of the town is the royal palace. The parliament meet here, which is composed of four prebends, and a pretty large number of senators, being the supreme tribunal of the whole duchy. The principal church is St Legar, and the Jesuits college is the most magnificent of all the monasteries. E. Long. 5. 50. N. Lat. 45. 35.

CHAMBERS (David), a Scots historian, priest, and lawyer, was born in the shire of Ross, about the year 1530, and educated in the university of Aberdeen. From thence he went to France and Italy, where he continued some time, particularly at Bologna, where, in 1556, he was a pupil of Marianus Sozenus.

After his return to Scotland, he was appointed, by queen Mary, parson of Suddy and chancellor of Ross. He was soon after employed in digesting the laws of Scotland, and was principally concerned in publishing the acts of parliament of that kingdom by authority in 1566. He was also appointed one of the lords of

session, and continued her majesty's faithful servant till her declining fortune obliged her adherents to seek for refuge in other kingdoms. Chambers went first to Spain, where he was graciously received by king Philip; and thence he travelled to Paris, where he was no less kindly received by Charles IX. of that kingdom, to whom, in 1572, he presented his history of Scotland, &c. He died at Paris in the year 1592, much regretted (says Mackenzie) by all who knew him. His writings were chiefly calculated to assist his royal mistresses, and to extol the wisdom of the Scots nation.

CHAMBERS (Ephraim), an eminent philosopher and fellow of the royal society, who has perpetuated his name by a most laborious work, first published in 1727, in two folio volumes, under the title of *Cyclopædia; or, An Universal Dictionary of Arts and Sciences*. All we know of Mr Chambers, is, that he served an apprenticeship to Senex a globe and map maker; but finding himself under no necessity to follow business, he took chambers in Gray's-Inn, devoted himself to study, and died about the year 1740.—The proprietors of the above work afterwards procured a *Supplement* to be compiled, which extended to two volumes more. Of both these the compilers of the *ENCYCLOPEDIA BRITANNICA* have availed themselves, by extracting every thing of value; every thing that, in the present improved state of science, seemed admissible, or concerning which no better information could be obtained.

CHAMBRE (Martin Cureau de la), physician in ordinary to the French king, was distinguished by his knowledge in medicine, philosophy, and polite learning. He was born at Mons; and was received into the French academy in 1635, and afterwards into the academy of sciences. He wrote a great number of works, the principal of which are, 1. The characters of the passions. 2. The art of knowing men. 3. On the knowledge of beasts, &c. He died at Paris in 1669.

CHAMELEON. See LACERTA.

CHAMFERING, in architecture, a phrase used for cutting any thing aslope on the under side.

CHAMIER (Daniel), an eminent protestant divine, born in Dauphiné. He was many years preacher at Montellimart; from whence he went, in 1612, to Montauban, to be professor of divinity in that city, and was killed by a cannon-ball during the siege in 1621. The most considerable of his works is his *L'assuetude Catholique*, or "Wars of the Lord," in four volumes, folio, in which he treats very learnedly of the controversies between the Protestants and Roman Catholics.

CHAMOIS, or CHAMOIS-GOAT, in zoology. See CAPRA.

CHAMOMILE. See ANTHEMIS.

CHAMOS, or CEMOSH, the idol or god of the Moabites.

The name of *chamos* comes from a root which, in Arabic, signifies to *make haste*; for which reason many believe *chamos* to be the sun, whose precipitate course might well procure it the name of swift or speedy. Others have confounded *chamos* with the god *Hammon*, adored not only in Libya and Egypt, but also in Arabia, Ethiopia, and the Indies.

Macrobius

Champagne
Champer-
try.

Macrobius shews that Hammon was the sun; and the horns, with which he was represented, denoted his rays. Calmet is of opinion, that the god Hamonus, and Apollo Chomeus, mentioned by Strabo and Ammianus Marcellinus, was the very same as chamos or the sun. These deities were worshipped in many of the eastern provinces. Some who go upon the resemblance of the Hebrew term *chamos*, to that of the Greek *comos*, have believed chamos to signify the god Bacchus the god of drunkenness, according to the signification of the Greek *comos*. St Jerom, and with him most other interpreters, take Chamos and Peor for the same deity. But it seems that Baal-Peor was the same as Tammuz or Adonis; so that Chamos must be the god whom the heathens call the Sun.

CHAMPAGNE, a considerable province of France, about 162 miles in length, and 112 in breadth, bounded on the north by Hainhalt and Luxemburg, on the east by Lorrain and the Franche-Comté, on the south by Burgundy, and on the west by the ile of France and Soissonois. It has a great number of rivers, the principal of which are the Meuse, the Seine, the Marne, the Aube, and the Aine. Its principal trade consists in excellent wine, all sorts of corn, linen, cloth, woollen stuffs, cattle, and sheep. It is also divided into the higher and lower, and Troys is the capital town. Its sub-divisions are Champagne Proper, and Rheimois, the Retelois, the Pertois, the Vallage, Bassigni, the Senois, and the Brie Champenois.

CHAMPAGNE Proper, is one of the eight parts of Champagne, which comprehend the towns of Troys, Chalons, St Menchold, Epemey, and Vertus.

CHAMPAIN, or Point CHAMPAIN, in heraldry, a mark of dishonour in the coat of arms of him who kills a prisoner of war after he has cried quarter.

CHAMPERTRY, in law, a species of MAINTRENANCE, and punished in the same manner; being a bargain with the plaintiff or defendant *champum partire*, "to divide the land," or other matter sued for between them, if they prevail at law; whereupon the champertor is to carry on the party's suit at his own expence. Thus *champart*, in the French law, signifies a similar division of profits, being a part of the crop annually due to the landlord by bargain or custom. In our sense of the word, it signifies the purchasing of a suit, or right of suing; a practice so much abhorred by our law, that it is one main reason why a *chose* in action, or thing of which one hath the right but not the possession, is not assignable in common law; because no man should purchase any pretence to sue in another's right. These pests of civil society, that are perpetually endeavouring to disturb the repose of their neighbours, and officiously interfering in other mens quarrels, even at the hazard of their own fortunes, were severally animadverted on by the Roman law; and were punished by the forfeiture of a third part of their goods and perpetual infamy. Hitherto also must be referred the provision of the statute 32 Henry VIII. c. 9. that no one shall sell or purchase any pretended right or title to land, unless the vender hath received the profits thereof for one whole year before such grant, or hath been in actual possession of the land, or of the reversion or remainder; on pain that both purchaser and vender shall each for-

Champion.
Chance.

feit the value of such land to the king and the profecutor. CHAMPION, a person who undertakes a combat in the place or quarrel of another; and sometimes the word is used for him who fights in his own cause.

It appears that champions, in the just sense of the word, were persons who fought instead of those that, by custom, were obliged to accept the duel, but had a just excuse for dispensing with it, as being too old, infirm, or being ecclesiastics, and the like. Such causes as could not be decided by the course of common law, were often tried by single combat; and he who had the good fortune to conquer, was always reputed to have justice on his side. See the article BATTLE.

CHAMPION of the King, (*campio regis*), is an ancient officer, whose office is, at the coronation of our kings, when the king is at dinner, to ride armed *cap-a-pee*, into Westminster-Hall, and by the proclamation of an herald make a challenge, "That if any man shall deny the king's title to the crown, he is there ready to defend it in single combat, &c." which being done, the king drinks to him, and sends him a gilt cup with a cover full of wine, which the champion drinks, and hath the cup for his fee. This office, at the coronation of king Richard II. when Baldwin Freville exhibited his petition for it, was adjudged from him to his competitor Sir John Dymocke (both claiming from Marmion), and hath continued ever since in the family of the Dymockes; who hold the manor of Sinvellby in Lincolnshire, hereditary from the Marmions by grand fejeantry, viz. that the lord thereof shall be the king's champion as aforesaid. Accordingly Sir Edward Dymocke performed this office at the coronation of king Charles II. and a person of the name of Dymocke performed at the coronation of his present majesty George the third.

CHAMPLAIN (Samuel de), a celebrated French navigator, the founder of the colony of New France, or Canada. He built Quebec; and was the first governor of the colony in 1603. Died after 1649. See QUEBEC.

CHANCE, a term we apply to events, to denote that they happen without any necessary or foreknown cause. See CAUSE.

Our aims, to ascribe those things to *chance*, which are not necessarily produced as the natural effects of any proper cause: but our ignorance and precipitancy lead us to attribute effects to *chance*, which have a necessary and determinate cause.

When we say a thing happens *by chance*, we really mean no more, than that its cause is unknown to us: not, as some vainly imagine, that *chance* itself can be the cause of any thing.

The case of the painter, who, unable to express the foam at the mouth of a horse he had painted, threw his sponge in despair at the piece, and, *by chance*, did that which he could not before do by design, is an eminent instance of the force of *chance*: yet, it is obvious, all we here mean by *chance*, is, that the painter was not aware of the effect; or that he did not throw the sponge with such a view: not but that he actually did every thing necessary to produce the effect; inasmuch, that, considering the direction wherein he threw his sponge, together with its form, specific

Chance.

specific gravity, the colours wherewith it was lineared, and the distance of the hand from the piece, it was impossible, on the present system of things, the effect should not follow.

Chance is frequently personified, and erected into a chimerical being, whom we conceive as acting arbitrarily, and producing all the effect whose real causes do not appear to us: in which sense the word coincides with the *τὸν, fortuna*, of the ancients.

CHANCE is also used for the manner of deciding things, the conduct or direction whereof is left at large, and not reducible to any determinate rules or measures; or where there is no ground for preference: as at cards, dice, lotteries, &c.

For the Laws of CHANCE, or the Proportion of Hazard in Gaming. See *GAME*.

The ancient *forts* or *chance*, M. Placetote observes, was instituted by God himself; and in the Old Testament we find several standing laws and express commands which prescribed its use on certain occasions: hence, the scripture says, "The lot, or *chance*, fell on Matthias," when it was in question who should fill Judas's place in the apostolate.

Hence also arose the *sortes sanctorum*; or method of determining things, among the ancient Christians, by opening some of the sacred books, and pitching on the first verse they cast their eye on, as a sure prognostic of what was to befall them. The *sortes Homerice, Virgiliane, Prænestine*, &c. used by the heathens, were with the same view, and in the same manner. See *SORTES*.

St Augustin seems to approve of this method of determining things future, and owns that he had practised it himself; grounded on this supposition, that God presides over *chance*; and on *Prov. xvi. 33*.

Many among the modern divines hold *chance* to be conducted in a particular manner by providence; and esteem it an extraordinary way which God uses to declare his will, and a kind of immediate revelation.

CHANCE-Medley, in law, is where one is doing a lawful act, and a person is killed by chance thereby; for if the act be unlawful, it is felony. If a person casts, not intending harm, a stone, which happens to hit one, whereof he dies; or shoots an arrow in an highway, and another that passeth by is killed thereby; or if a workman, in throwing down rubbish from a house, after warning to take care, kills a person; or a schoolmaster in correcting his scholar, a master his servant, or an officer in whipping a criminal in a reasonable manner, happens to occasion his death; it is chance-medley and misadventure. But if a man throw stones in a highway, where persons usually pass; or shoot an arrow, &c. in a market place among a great many people; or if a workman cast down rubbish from a house, in cities and towns where people are continually passing; or a school-master, &c. correct his servant or scholar, &c. exceeding the bounds of moderation; it is manslaughter; and if with an improper instrument of correction, as with a sword or iron bar, or by kicking, stamping, &c. in a cruel manner, it is murder. If a man whips his horse in a street to make him gallop, and the horse runs over a child and kills it, it is manslaughter.

VOL. III.

slaughter: but if another whips the horse, it is manslaughter in him, and chance-medley in the rider. And if two are fighting, and a third person coming to part them is killed by one of them without any evil intent, yet this is murder in him; and not manslaughter by chance-medley or misadventure. In chance-medley, the offender forfeits his goods; but hath a pardon of course.

CHANCELLER, is properly that part of the choir of a church, between the altar or communion-table, and the balustrade or rail that incloses it; where the minister is placed at the celebration of the communion. The word comes from the Latin *cancellus*, which in the lower Latin is used in the same sense, from *cancelli*, "lattices or cross bars," wherewith the *chancels* were anciently incompassed, as they now are with rails. The right of a seat and a sepulchre in the *chancels*, is one of the privileges of founders.

CHANCELLOR, was at first only a chief notary or scribe under the emperors; and was called *cancellarius*, because he sat behind a lattice (in Latin *cancellus*) to avoid being crowded by the people: though some derive the word from *cancellare* to cancel; (see *CHANCERY*.) This officer was afterwards invested with several judicial powers, and a general superintendency over the rest of the officers of the prince. From the Roman empire it passed to the Roman church, ever emulous of imperial state; and hence every bishop has to this day his chancellor, the principal judge of his consistory. And when the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preferred its chancellor with different jurisdictions and dignities, according to their different constitutions. But in all of them he seems to have had the supervision of all charters, letters, and such other public instruments of the crown as were authenticated in the most solemn manner: and therefore, when seals came in use, he had always the custody of the king's great seal.

Lord High CHANCELLOR of Great Britain, or *Lord Keeper of the Great Seal*, is the highest honour of the long robe, being created by the mere delivery of the king's great seal into his custody: whereby he becomes, without writ or patent, an officer of the greatest weight and power of any now subsisting in the kingdom; and superior, in point of precedence, to every temporal lord. He is a privy counsellor by his office; and, according to Lord Chancellor Ellesmere, prolocutor of the house of lords by prescription. To him belongs the appointment of all the justices of the peace throughout the kingdom. Being in former times usually an ecclesiastic, (for none else were then capable of an office so conversant in writing,) and presiding over the royal chapel, he became keeper of the king's conscience; visitor, in right of the king, of all hospitals and colleges of the king's foundation; and patron of all the king's livings under the value of *L. 20 per annum*, in the king's books. He is the general guardian of all infants, idiots, and lunatics; and has the general superintendency of all charitable uses in the kingdom. And all this over and above the vast extensive jurisdiction which he exercises in his judicial capacity in the court of chancery. See *CHANCERY*.

Chancel
|
Chancellor.

Chancellor

Chancery.

CHANCELLOR of a *Cathedral*, an officer that hears lessons and lectures read in the church, either by himself or his vicar; to correct and set right the reader when he reads amiss; to inspect schools; to hear causes; apply the seal; write and dispatch the letters of the chapter; keep the books; take care that there be frequent preachings, both in the church and out of it; and assign the office of preaching to whom he pleases.

CHANCELLOR of the *Duchy of Lancaster*, an officer appointed chiefly to determine controversies between the king and his tenants of the duchy-land, and otherwise to direct all the king's affairs belonging to that court. See *DUCHY-Court*.

CHANCELLOR of the *Exchequer*, an officer who presides in that court, and takes care of the interest of the crown. He is always in commission with the lord-treasurer, for the letting of crown-lands, &c. and has power, with others, to compound for forfeitures of lands, upon penal statutes: He has also great authority in managing the royal revenues, and in matters relating to the first-fruits.

CHANCELLOR of the *Order of the Garter*, and other *Military Orders*, is an officer who seals the commissions and mandates of the chapter and assembly of the knights, keeps the register of their proceedings, and delivers acts thereof under the seal of their order.

CHANCELLOR of an *University*, is he who seals the diplomas, or letters of degrees, provision, &c. given in the university.

The chancellor of Oxford is usually one of the prime nobility, chosen by the students themselves in convocation. He is their chief magistrate; his office is, *durante vita*, to govern the university, preserve and defend its rights and privileges, convoke assemblies, and do justice among the members under his jurisdiction.

Under the chancellor is the vice-chancellor, who is chosen annually, being nominated by the chancellor, and elected by the university in convocation: He is always the head of some college, and in holy orders. His proper office is to execute the chancellor's power, to govern the university according to her statutes, to see that officers and students do their duty, that courts be duly called, &c. When he enters upon his office, he chuses four pro-vice-chancellors out of the heads of the colleges, to execute his power in his absence.

The chancellor of Cambridge is also usually one of the prime nobility, and in most respects the same as that in Oxford; only he does not hold his office *durante vita*, but may be elected every three years. Under the chancellor there is a commissary, who holds a court of record for all privileged persons and scholars under the degree of master of arts, where all causes are tried and determined by the civil and statute law, and by the custom of the university.

The vice-chancellor of Cambridge is chosen annually by the senate, out of two persons nominated by the heads of the several colleges and halls.

CHANCERON, in natural history, a name given by the French writers to the small caterpillar that eats the corn, and does vast mischief in their granaries. See the article *CORN-Butterfly*.

CHANCERY, the highest court of justice in Britain

next to the parliament, and of very ancient institution. It has its name chancery (*cancellaria*) from the judge who presides here, the lord chancellor, or *cancellarius*; who, according to Sir Edward Coke, is so termed a *cancellando*, from cancelling the king's letters patent when granted contrary to law, which is the highest point of his jurisdiction. In chancery there are two distinct tribunals: the one ordinary, being a court of common law; the other extraordinary, being a court of equity.

1. The ordinary legal court holds pleas of recognizances acknowledged in the chancery, writs of *scire facias*, for repeal of letters patent, writs of partition, &c. and also of all personal actions by or against any officer of the court. Sometimes a *superfideas*, or writ of privilege, hath been here granted to discharge a person out of prison: one from hence may have a *habeas corpus* prohibition, &c. in the vacation; and here a *subpena* may be had to force witnesses to appear in other courts, when they have no power to call them. But, in prosecuting causes, if the parties descend to issue, this court cannot try it by jury; but the lord chancellor delivers the record into the king's bench to be tried there; and after trial had, it is to be remanded into the chancery, and there judgment given: though if there be a demurrer in law, it shall be argued in this court.

In this court is also kept the *officina justitie*; out of which all original writs that pass under the great seal, all commissions of charitable uses, sewers, bankruptcy, idiocy, lunacy, and the like, do issue; and for which it is always open to the subject, who may there at any time demand and have, *ex debito justitie*, any writ that his occasions may call for. These writs, relating to the business of the subject, and the returns to them, were, according to the simplicity of ancient times, originally kept in a hamper, *in hanaperie*; and the others, (relating to such matters wherein the crown is mediately or immediately concerned,) were preserved in a little sack or bag, *in parva бага*; and hence hath arisen the distinction of the *hanaper* office, and the *petty-bag* office, which both belong to the common law-court in chancery.

2. The extraordinary court, or court of equity, proceeds by the rules of equity and conscience; and moderates the rigour of the common law, considering the *intention* rather than the *words* of the law. It gives relief for and against infants notwithstanding their minority, and for and against married women notwithstanding their coverture. All frauds and deceits, for which there is no redress at common law; all breaches of trust and confidence; and accidents, as to relieve obligors, mortgagers, &c. against penalties and forfeitures, where the intent was to pay the debt, are here remedied: for in chancery, a forfeiture, &c. shall not bind, where a thing may be done after, or compensation made for it. Also this court will give relief against the extremity of unreasonable engagements entered into without consideration; oblige creditors, that are unreasonable, to compound with an unfortunate debtor; and make executors, &c. give security and pay interest for money that is to lie long in their hands. This court may confirm title to lands, though one hath lost his writings; and render conveyances, defective through

Chancery.

Chancery
Chandler.

Chandler
Changes.

through mistake, &c. good and perfect. In chancery, copy-holders may be relieved against the ill usage of their lords; inclosures of lands that are common, be decreed; and this court may decree money or lands given to charitable uses, oblige men to account with each other, &c. But, in all cases where the plaintiff can have his remedy at law, he ought not to be relieved in chancery; and a thing which may be tried by a jury is not triable in this court.

The proceedings in chancery are, first to file the bill of complaint, signed by some counsel, setting forth the fraud or injury done, or wrong sustained, and praying relief; after the bill is filed, process of *subpoena* issues to compel the defendant to appear; and when the defendant appears, he puts in his answer to the bill of complaint, if there be no cause for the plea to the jurisdiction of the court, in disability of the person, or in bar, &c. Then the plaintiff brings his replication, unless he files exceptions against the answer as insufficient, referring it to a master to report whether it be sufficient or not; to which report exceptions may also be made. The answer, replication, rejoinder, &c. being settled, and the parties come to issue, witnesses are to be examined upon interrogatories, either in court, or by commission in the country, wherein the parties usually join; and when the plaintiff and defendant have examined their witnesses, publication is to be made of the depositions, and the cause is to be set down for hearing, after which follows the decree. But it is now usual to appeal to the house of lords; which appeals are to be signed by two noted counsel, and exhibited by way of petition: the petition or appeal is lodged with the clerk of the house of lords, and read in the house, whereon the apellee is ordered to put in his answer, and a day fixed for hearing the cause; and after counsel heard, and evidence given on both sides, the lords will affirm or reverse the decree of the chancery, and finally determine the cause by a majority of votes, &c.

CHANDELIER, in fortification, a kind of moveable parapet, consisting of a wooden frame, made of two upright stakes, about six feet high, with cross planks between them; serving to support fascines to cover the pioneers.

CHANDERNAGORE, a French settlement in the kingdom of Bengal in the East Indies. It lies on the river Ganges, two leagues and a half above Calcutta. The district is hardly a league in circumference, and has the disadvantage of being somewhat exposed on the western side; but its harbour is excellent, and the air is as pure as it can be on the banks of the Ganges. Whenever any building is undertaken that requires strength, it must here, as well as in all other parts of Bengal, be built upon piles: it being impossible to dig three or four feet without coming at water.

CHANDLER (Mary), distinguished by her talent for poetry, was the daughter of a dissenting minister at Bath; and was born at Malmesbury in Wiltshire, in 1687. She was bred a milliner; but from her childhood had a turn for poetry, and in her riper years applied herself to the study of the poets. Her poems, for which she was complimented by Mr Pope, breathe the spirit of piety and philosophy. She had the misfortune to be deformed, which determined her to live

single; though she had great sweetness of countenance, and was solicited to marry. She died in 1745, aged 58.

CHANDLER (Dr Samuel), a learned and respectable dissenting minister, descended from ancestors heartily engaged in the cause of religious liberty, and sufferers for the sake of conscience and nonconformity; was born at Hungerford in Berks, where his father was a minister of considerable worth and abilities. Being by his literary turn destined to the ministry, he was first placed at an academy at Bridgewater, and from thence removed to Gloucester under Mr Samuel Jones. Beginning to preach in 1714, he was two years afterwards chosen minister of a congregation at Peckham in Surry; and then joint preacher with the learned Dr Lardner, of a winter weekly evening lecture at the meeting-house in the Old Jewry London: in which meeting he was established assistant preacher about the year 1725, and then as the pastor. Here he ministered to the religious improvement of a very respectable congregation for 40 years with the greatest applause; and with what diligence and application he improved the vacancies of time from his pastoral duties, for improving himself and benefiting the world, will appear from his many writings on a variety of important subjects. While he was thus laudably employed, not only the universities of Edinburgh and Aberdeen gave him, without any application, testimonies of their esteem in diplomas, conferring on him the degree of D. D. but he also received offers of preferment from some of the governors of the established church, which he nobly declined. Dr Chandler first formed the plan of the fund for the widows and orphans of poor dissenting ministers; to which, by his interest and industry, he procured very generous subscriptions. He died in 1766.

CHANGER, an officer belonging to the king's mint, who changes money for gold, or silver bullion. See MINT.

Money-CHANGER, is a banker, who deals in the exchange, receipt, and payment, of moneys. See BANKER.

CHANGES, in arithmetic, &c. the permutations or variations of any number of quantities; with regard to their position, order, &c. See COMBINATION.

To find all the possible CHANGES of any Number of Quantities, or how oft their Order may be varied. Suppose two quantities a and b . Since they may be either wrote a or b , it is evident their changes are 2.—2. 1. Suppose three quantities a b c : their changes will be as in the margin; as is evident by combining c first with a , then with b ; and hence the number of changes arises 3. 2. 1.—6. If the quantities be 4, each may be combined four ways with each order of the other three; whence the number of changes arises 6. 4.—24. 3. 2. 1.—24. Wherefore, if the number of quantities be supposed n , the number of changes will be $n.n-1.n-2.n-3.n-4$, &c. If the same quantity occur twice, the changes of two will be found bb ; of three, bab , abb , bcb ; of four, $cbab$, $cbac$, $babc$, &c. And thus the number of changes in the first case will be 1.—(2. 1) : 2. 1; in the second, 2.—(3. 2. 1) : 2. 1; in the third, 12.—(4. 3. 2. 1) : 2. 1.

Changes
Channa.

If a fifth letter be added, in each series of four quantities, it will beget five *changes*, whence the number of all the *changes* will be $6 \times (5.4.3.2.)1, : 2.1$. Hence if the number of quantities be n , the number of *changes* will be $(n.n-1.n-2.n-3.n-4. \&c.) : 2.1$. From these special formulæ may be collected a general one, *viz.* if n be the number of quantities, and m the number which shews how oft the same quantity occurs; we shall have $(n.n-1.n-2.n-3.n-4.n-5.n-6.n-7.n-8.n-9. \&c.) : m-1.m-2.m-3.m-4. \&c.)$. The series being to be continued, till the continual subtraction of unity from n and m leave 0. After the same manner we may proceed further, till putting n for the number of quantities, and $l, m, r, \&c.$ for the number that shews how oft any of them is repeated, we arrive at an universal form. $(n.n-1.n-2.n-3.n-4.n-5.n-6.n-7.n-8. \&c.) : (l.l-1.l-2.l-3.l-4.l-5. \&c. m.m-1.m-2.m-3. \&c. r.r-1.r-2.r-3.r-4.r-5. \&c.)$.

Suppose, for instance, $n=6, l=3, r=0$. The number of *changes* will be $(6.5.4.3.2.1) : (3.2.1.3.2.1) = (6.5.4) : (3.2.2.5.2=20)$.

Hence, suppose thirteen persons at a table, if it be required how oft they may *change* places; we shall find the number 13.12.11.10.9.8.7.6.5.4.3.2.1. = 6227020800.

In this manner may all the possible anagrams of any word be found in all languages, and that without any study: suppose, *v.g.* it were required to find the anagrams of the word *amor*, the number of *changes* will be

a	e a m	r m o a	m a r o	a r o m
—	a o m	m r o a	m a o r	a o r m
m a	a m o	m o r a	—	a o m r
a m	—	m o a r	r a o m	—
—	r o m a	—	o r a m	r a m o
o m a	o r m a	r m a o	a r m o	a r m o
m o a	o m r a	m r a o	o a m r	a m r o
m a o	o m a r	—	a m o r	—
		r a o m		

The anagrams therefore of the word *amor*, in the Latin tongue, are *roma, mora, maro, ramo, armo*. See ANAGRAM.

Whether this new method of anagramatizing be like to prove of much service to that art, is left to the poets.

CHANNA, in zoology, the name of a fish caught in great plenty in the Mediterranean, and brought to market in Italy and elsewhere, among the sea-perch, which it so nearly resembles, that it would not be distinguishable from it, but that the sea-perch is bigger, and has only broad transverse lines on its back, whereas the channa has them both transverse and longitudinal. It has a very wide mouth, and its lower jaw is longer than its upper; so that its mouth naturally falls open. Its eyes are small, and its teeth very sharp: its back is of a blackish red; it has several longitudinal lines of a reddish hue, and its tail is marked with reddish spots. There is an observation, that in all the fish of this kind which have been examined by naturalists, there have been found none but females. This is as old as the days of Aristotle. Whether this be true in fact, would require many observations. If it should prove so, the whole seems to end in this, that the channa is no distinct species, but only the female

of some other fish. There is another fish not unlike this, called *cannadella*, or rather *channadella*, which at Marseilles is known by the name of *charina*.

CHANNEL, in geography, an arm of the sea, or a narrow sea between two continents, or between a continent and an island. Such are the British channel, St George's channel, the channel of Constantinople, &c.

CHANNELS of a Ship. See CHAIN-WALES.

CHANT, (*cantus*), is used for the vocal music of churches.

In church-history we meet with divers kinds of *chant* or *song*. The first is the *Ambrosian*, established by St Ambrose. The second, the *Gregorian chant*, introduced by Pope Gregory the great, who established schools of chantors, and corrected the church-song. This is still retained in the church under the name of *plain song*: at first it was called the *Roman song*. The *plain* or *Gregorian chant*, is where the choir and people sing in unison, or all together in the same manner.

CHANTILLY, a village in France, about seven leagues from Paris, where there is a magnificent palace and fine forest belonging to the duke of Bourbon.

CHANTOR, a singer of a choir in a cathedral. The word is almost grown obsolete, *chorister* or *singing-man* being commonly used instead of it. All great chapters have chantors and chaplains to assist the canons, and officiate in their absence.

CHANTOR is used by way of excellence for the precentor or master of the choir, which is one of the first dignities of the chapter. At St David's in Wales, where there is no dean, he is next in dignity to the bishop. The ancients called the chantor *prætorinus cantorum*. To him belonged the direction of the deacons and other inferior officers.

Chantors in the temple of Jerusalem, were a number of Levites employed in singing the praises of God, and playing upon instruments before his altar. They had no habits distinct from the rest of the people; yet in the ceremony of removing the ark to Solomon's temple, the chantors appeared dressed in tunics of byssus or fine linen. 2 Chron. v. 12.

CHAUNTRY, or CHANTRY, was anciently a church or chapel endowed with lands, or other yearly revenue, for the maintenance of one or more priests, daily saying or singing mass for the souls of the donors, and such others as they appointed. Hence *chantry-rents* are rents paid to the crown by the tenants or purchasers of *chantry-lands*.

CHAOLGY, the history or description of the chaos. See CHAOS.

Orpheus, in his chaology, sets forth the different alterations, secretions, and divers forms which matter went through till it became inhabitable, which amounts to the same with what we otherwise call *cosmogony*. Dr Burnet, in his theory of the earth, represents the chaos as it was at first, entire, undivided, and universally rude and deformed; or the *tohu bohu*: then shews how it came to be divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened, and became a solid habitable globe. See EARTH.

CHAOS, that confusion in which matter lay when newly

Channel
Chaos.

Chaos
|
Chapelain.

newly produced out of nothing at the beginning of the world, before God, by his almighty word, had put it into the order and condition wherein it was after the six days creation. See EARTH.

CHAOS, in zoology, a genus of insects belonging to the order of vermes zoophyta. The body has no shell or covering, and is capable of reviving after being dead to appearance for a long time: it has no joints or external organs of sensation. There are five species, mostly obtained by infusions of different vegetables in water, and only discoverable by the microscope. See ANIMALCULE.

CHAPÉAU, in heraldry, an ancient cap of dignity worn by dukes, being scarlet-coloured velvet on the outside, and lined with a fur. It is frequently borne above an helmet instead of a wreath, under gentlemen's crests. See HERALDRY, n° 27.

CHAPEL: a place of divine worship, so called. The word is derived from the Latin *capella*. In former times, when the kings of France were engaged in war, they always carried St Martin's hat into the field, which was kept in a tent as a precious relic: from whence the place was called *capella*; and the priests, who had the custody of the tent, *capellani*. Afterwards the word *capella* became applied to private oratories.

In Britain there are several sorts of chapels. 1. Parochial chapels: these differ from parish-churches only in name; they are generally small, and the inhabitants within the district few. If there be a presentation *ad ecclesiam*, instead of *capellani*, and an admission and institution upon it, it is no longer a chapel, but a church. 2. Chapels, which adjoin to and are part of the church: such were formerly built by honourable persons, as burying-places for themselves and their families. 3. Chapels of ease; these are usually built in very large parishes, where all the people cannot conveniently repair to the mother-church. 4. Free chapels; such as were founded by kings of England. They are free from all episcopal jurisdiction, and only to be visited by the founder and his successors; which is done by the lord chancellor: yet the king may license any subject to build and endow a chapel, and by letters patent exempt it from the visitation of the ordinary. 5. Chapels in the universities, belonging to particular colleges. 6. Domestic chapels, built by noblemen or gentlemen for the private service of God in their families. See CHAPLAIN.

Knights of the CHAPEL, called also "Poor knights of Windsor," were instituted by Henry VIII. in his testament. Their number was at first thirteen, but has been since augmented to twenty-six. They assist in the funeral services of the kings of England: they are subject to the office of the canons of Windsor, and live on pensions assigned them by the order of the garter. They bear a blue or red cloak, with the arms of St George on the left shoulder.

CHAPÉLAIN (James), an eminent French poet born at Paris in 1595, and often mentioned in the works of Balzac, Menage, and other learned men. He wrote several works, and at length distinguished himself by an heroic poem called *La Pucelle, ou France Délivrée*, which employed him several years; and which, raising the expectation of the public, was as much derided by some as extolled by others. He was

one of the king's confessors; and died in 1674, very rich, but was very covetous and fordid.

CHAPELET, in the menage, a couple of stirrup-leathers, mounted each of them with a stirrup, and joined at top in a sort of leather buckle, called the head of the chapellet, by which they are made fast to the pommel of the saddle, after being adjusted to the rider's length and bore. They are used both to avoid the trouble of taking up or letting down the stirrups, every time that the gentleman mounts on a different horse and saddle, and to supply the place of the academy saddles, which have no stirrups to them.

CHAPELLE (Claudius Emanuel Luillier,) the natural son of Francis Luillier, took the name of Chapellet from a village between Paris and St Denys, where he was born. He distinguished himself by writing small pieces of poetry, in which he discovered great delicacy, an easy turn, and an admirable facility of expression. He was the friend of Gassendi and Moliere; and died in 1636.

CHAPITERS, in architecture, the same with CAPITALS.

CHAPITERS, in law, formerly signified a summary of such matters as were inquired of, or presented before justices in eyre, justices of assize, or of the peace, in their sessions.

Chapters, at this time, denote such articles as are delivered by the audience of the justice in his charge to the inquest.

CHAPLAIN, an ecclesiastic who officiates in a chapel. See CHAPEL.

The king of Great Britain hath 48 chaplains in ordinary, usually eminent doctors in divinity, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the closet. Besides, there are 24 chaplains at Whitehall, fellows of Oxford or Cambridge, who preach in their turns, and are allowed 30*l.* *per annum* each. According to a statute of Henry VIII. the persons vested with a power of retaining chaplains, together with the number each is allowed to qualify, is as follows: An archbishop, eight; a duke or bishop, six; a marquis or earl, five; a viscount, four; a baron, knight of the garter, or lord-chancellor, three; a dutches, marchioness, countess, baroness, the treasurer and comptroller of the king's house, clerk of the closet, the king's secretary, dean of the chapel, almoner, and master of the rolls, each of them two; chief justice of the king's bench, and warden of the cinque-ports, each one. All these chaplains may purchase a licence or dispensation, and take two benefices with cure of souls. A chaplain must be retained by letters testimonial under hand and seal; for it is not sufficient that he serve as chaplain in the family.

CHAPLAIN of the *Order of Malta*, otherwise called *diaco*, and *clerk conventual* the second class of the order of Malta. The knights make the first rank.

CHAPELET, an ancient ornament for the head, like a garland or wreath; but this word is frequently used to signify the circle of a crown. There are instances of its being borne in a coat of arms, as well as for crests; the paternal arms for Lascelles are argent, three chapellets, gules.

Chapelet
|
Chaplet.

CHAPLET also denotes a string of beads used by the Roman Catholics, to count the number of their prayers. The invention of it is ascribed to Peter the hermit, who probably learned it of the Turks, as they owe it to the East-Indians.

Chaplets are sometimes called *pater-nosters*; and are made of coral, of diamonds, of wood, &c. The common chaplet contains fifty ave-marias, and five pater-nosters. There is also a chaplet of our Saviour, consisting of 33 beads, in honour of his 33 years living on earth, instituted by father Michael the Camaldulian.

The Orientals have a kind of chaplets which they call *chains*, and which they use in their prayers, rehearsing one of the perfections of God on each link or bead. The Great Mogul is said to have 18 of these chains, all precious stones; some diamonds, others rubies, pearls, &c. The Turks have likewise chaplets, which they bear in the hand, or hang at the girdle: but father Dandini observes, they differ from those used by the Romanius, in that they are all of the same bigness, and have not that distinction into decads; though they consist of six decads, or 60 beads. He adds, that the muslimans run over the chaplet almost in an instant, the prayers being extremely short, as containing only these words, "praise to God," or "glory to God," for each bead. Besides the common chaplet they have likewise a larger one consisting of 100 beads, where there is some distinction, as being divided by little threads into three parts; on one of which they repeat 30 times *subhan Allah*, i. e. "God is worthy to be praised;" on another, *ellamb Allah*, "glory be to God;" and on the third, *Allah echer*, "God is great." These thrice thirty times making only 90; to complete the number 100, they add other prayers for the beginning of the chaplet.—He adds, that the Mahometan chaplet, appears to have had its rise from the *mea veracoth*, or "hundred benedictions;" which the Jews are obliged to repeat daily, and which we find in their prayer-books; the Jews and Mahometans having this in common, that they scarce do any thing without pronouncing some laud or benediction.

Menage derives the word *chaplet* from *chapeau*, "hat." The modern Latins call it *chapellina*, the Italians more frequently *corona*.

CHAPMAN (George), born in 1557, a man highly esteemed in his time for his dramatic and poetic works. He wrote 17 plays; translated Homer and some other ancient poets; and was thought no mean genius. He died in 1634; and was buried in St Giles's in the fields, where his friend Inigo Jones erected a monument to him.

CHAPPE, in heraldry, the dividing an escutcheon by lines drawn from the centre of the upper edge to the angles below, into three parts, the sections on the sides being of different metal or colour from the rest.

CHAPPEL IN FRITH, a market-town of Derbyshire, about 26 miles north-west of Derby; W. Long. 1. 50. N. Lat. 53. 22.

CHAPPEL (William) a learned and pious bishop of Cork, Cloyne, and Ross, in Ireland, born in Nottinghamshire in 1582. When the troubles began under Char. I. he was prosecuted by the puritan party in parliament; and retired to Derby, where he devoted himself to

study until his death in 1649. He wrote *Methodus Concionandi*, i. e. "the method of preaching;" and is one of those to whom the *Whole Duty of Man* has been attributed. He left behind him also his own life written by himself in Latin, which has been twice printed.

CHAPTER, in ecclesiastical polity, a society or community of clergymen belonging to the cathedrals and collegiate-churches.

It was in the eighth century that the body of canons began to be called a chapter. The chapter of the canons of a cathedral were a standing council to the bishop, and, during the vacancy of the see, had the jurisdiction of the diocese. In the earlier ages, the bishop was head of the chapter; afterwards abbots and other dignitaries, as deans, provosts, treasurers, &c. were preferred to this distinction. The deans and chapters had the privilege of choosing the bishops in England; but Henry VIII. got this power vested in the crown: and as the same price expelled the monks from the cathedrals, and placed secular canons in their room, those he thus regulated were called deans and chapters of the new foundation; such as Canterbury, Winchester, Ely, Carlisle, &c. See **DEAN**.

CHAPTER, in matters in literature, a division in a book for keeping the subject treated of more clear and distinct.

CHAR, in ichthyology, a species of **SALMO**.

CHARABON, a sea-port town on the northern coast of the island of Java in the East-Indies; E. Long. 10. 8. S. Lat. 6.

CHARACTER, in a general sense, signifies a mark, or figure, drawn on paper, metal, stone, or other matter, with a pen, graver, chisell, or other instrument, to signify or denote any thing.

The word is Greek, *χαρακτῆρ*, formed from the verb *χαράσσειν*, *insculpare*, to engrave, impress, &c.

The various kinds of characters may be reduced to three heads, *viz.* *Literal Characters*, *Numeral Characters*, and *Abbreviations*.

1. *Literal CHARACTER*, is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea or conception of the mind. See **ALPHABET**.

2. These may be divided, with regard to their nature and use, into *Nominal Characters*, or those we properly call *letters*; which serve to express the names of things: See **LETTER**. *Real Characters*; those that instead of names express things and ideas: See **IDEA**, &c. *Emblematical*, or *Symbolical Characters*; which have this in common with real ones, that they express the things themselves; but have this further, that they in some measure personate them, and exhibit their form: such are the hieroglyphics of the ancient Egyptians. See **HIEROGLYPHIC**, **SYMBOL**, &c.

3. *Literal CHARACTERS* may be again divided, with regard to their invention and use, into *particular* and *general* or *universal*.

Particular CHARACTERS, or those peculiar to this or that nation. Such are the Roman, Italian, Greek, Hebrew, Arabic, Gothic, Chinese, &c. characters. See **HEBREW**, **GOthic**, **CHINESE**, &c.

Universal CHARACTERS, are also *real characters*, and make what some authors call a *Philosophical Language*.

That diversity of *characters* used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of *characters* that should be universal, and which each people should read in their own language. The *character* here is to be real, not nominal: to express things and notions; not, as the common ones, letters or sounds: yet to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, every nation should retain its own language, yet every one understand that of each other, without learning it; only by seeing a real or universal *character*, which should signify the same things to all people, by what sounds forever each express it in their particular idiom. For instance, by seeing the *character* destined to signify to *drink*, an Englishman should read to *drink*; a Frenchman, *boire*; a Latin, *bibere*; a Greek, *πινεν*; a Jew, *שָׁוּ*; a German, *trinken*; and so of the rest: in the same manner as seeing a horse, each people expresses it after their own manner; but all mean the same animal.

This real *character* is no chimera; the Chinese and Japanese have already something like it. They have a common *character* which each of those nations understand alike in their several languages; though they pronounce them with such different sounds, that they do not understand one another in speaking.

The first and most considerable attempts for a real *character*, or philosophical language, in Europe, are those of bishop Wilkins, and Dalgarnie: but these, with how much art forever they were contrived, have yet proved ineffectual.

M. Leibnitz had some thoughts the same way; he thinks those great men did not hit the right method. It was probable, indeed, that by their means, people, who do not understand one another, might easily have a commerce together; but they have not hit on true real *characters*.

According to him, the *characters* should resemble those used in algebra: which, in effect, are very simple, yet very expressive; without any thing superfluous or equivocal; and contain all the varieties required.

The real *character* of bishop Wilkins has its just applause: Dr Hook recommends it on his own knowledge and experience, as a most excellent scheme; and to engage the world to the study thereof, publishes some fine inventions of his own therein.

M. Leibnitz tells us, he had under consideration an *alphabet of human thoughts*; in order to a new philosophical language, on his own scheme: but his death prevented its being brought to maturity.

M. Lodwic, in the *philosophical transactions*, gives us a plan of an universal *alphabet* or *character* of another kind: this was to contain an enumeration of all such single sounds, or letters, as are used in any language; by means whereof, people should be enabled to pronounce truly and readily any language; to describe the pronunciation of any language that shall be pronounced in their hearing, so as others accustomed to this language, though they had never heard the language pronounced, shall at first be able truly to pronounce it: and, lastly, this *character* to serve as a stan-

dard to perpetuate the sounds of any language. In the Journal Litteraire, an. 1720, we have a very ingenious project for an universal *character*. The author, after obviating the objections that might be made against the feasibility of such schemes in the general, proposes his own: his *characters* are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new *character* at once saved; the Arabic figures having already all the universality required.

The advantages are immense. For, 1^o, We have here a stable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2^o, Whereas the difficulty of pronouncing a foreign language is such as usually gives the learner the greatest trouble, and there are even some sounds which foreigners never attain to; in the *character* here proposed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the acquainting the pen and the eye to affix certain notions to *characters* that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflections of words are here to be expressed by the common letters. For instance, the same *character* shall express a *filly*, or a *colt*, a *horse*, or a *mare*, an *old horse*, or an *old mare*, as accompanied with this or that distinctive letter, which shall shew the sex, youth, maturity, or old age: a letter also to express the bigness or size of things; thus, *e. g.* a man with this or that letter, to signify a *great man*, or a *little man*, &c.

The use of these letters belongs to the grammar; which, once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declension, and one conjugation: those numerous anomalies of grammarians are exceeding troublesome; and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the *character* here proposed, men of sense having the introduction of it, would have a new ground, whereon to build regularly.

But the difficulty is not in inventing the most simple, easy, and commodious *character*, but in engaging the several nations to use it; there being nothing they agree less in, than the understanding and pursuing their common interest.

3. Literal *characters* may again be divided, with respect to the nations among whom they have been invented, into Greek characters, Roman characters, Hebrew characters, &c. The Latin character now used through all Europe, was formed from the Greek, as the Greek was from the Phœnician; and the Phœnician, as well as the Chaldee, Syriac, and Arabic characters, were formed from the ancient Hebrew, which subsisted till the Babylonish captivity; for after that event the character of the Assyrians, which is the square Hebrew now in use, prevailed, the ancient being only found

Characters. found on some Hebrew medals, commonly called Samaritan medals. It was in 1097 that the Gothic characters, invented by Uthlas, were abolished, and the Latin ones established in their room.

Medallists observe, that the Greek character, consisting only of majuscule letters, has preserved its uniformity on all medals, as low as the time of Gallienus; from which time it appears somewhat weaker and rounder: from the time of Constantine to Michael we find only Latin characters: after Michael, the Greek characters recommence; but from that time they began to alter with the language, which was a mixture of Greek and Latin. The Latin medals preserve both their character and language as low as the translation of the seat of the empire to Constantinople: towards the time of Decius the character began to lose its roundness and beauty; some time after, it retrieved, and subsisted tolerably till the time of Justin, when it degenerated gradually into the Gothic. The rounder, then, and better formed a character is upon a medal, the fairer pretence it has to antiquity.

II. **Numeral CHARACTERS**, or characters used to express numbers, are either letters or figures.

The Arabic character, called also the common one, because it is used almost throughout Europe in all sorts of calculations, consists of these ten digits 1, 2, 3, 4, 5, 6, 7, 8, 9, 0.

The Roman numeral character consists of seven majuscule letters of the Roman alphabet, viz. I, V, X, L, C, D, M. The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand. The I repeated twice makes two, II; thrice, three, III; four is expressed thus IV, as I before V or X takes an unit from the number expressed by these letters. To express six, an I is added to a V, VI; for seven, two, VII: and for eight, three, VIII. nine is expressed by an I before X, thus IX. The same remark may be made of the X before L or C, except that the diminution is by tens; thus, XL denotes forty, XC ninety, and LX sixty. The C before D or M diminishes each by a hundred. The number five hundred is sometimes expressed by an I before a C inverted, thus, IC; and instead of M, which signifies a thousand, an I is sometimes used between two Cs, the one direct, and the other inverted, thus CIO. The addition of C and O before or after raises, CIO by tens, thus, CCIOO expresses ten thousand, CCCIOOO, a hundred thousand. The Romans also expressed any number of thousands by a line drawn over any numeral less than a thousand; thus \overline{V} denotes five thousand, \overline{LX} , sixty thousand: so likewise \overline{M} is one million, \overline{MM} is two millions, &c.

The Greeks had three ways of expressing numbers: 1. Every letter, according to its place in the alphabet, denoted a number, from α , one, to ω , twenty-four. 2. The alphabet was divided into eight units, α one, β two, γ three, &c.; into eight tens, ι ten, κ twenty, λ thirty, &c.; and eight hundreds, ρ one hundred, σ two hundred, τ three hundred, &c. 3. I stood for one, II five, Δ ten, H a hundred, X a thousand, M ten thousand; and when the letter II inclosed any of these, except I, it shewed the inclosed letter to be

five times its value; as $\overline{\Delta}$ fifty, \overline{H} five hundred, \overline{X} five thousand, \overline{M} fifty thousand.

The French CHARACTER used in the chamber of accounts, and by persons concerned in the management of the revenue, is, properly speaking, nothing else than the Roman numerals, in letters that are not majuscule: thus, instead of expressing fifty-six by LVI, they denote it by smaller characters lvj.

III. **CHARACTERS of Abbreviations, &c.** in several of the arts, are symbols contrived for the more concise and immediate conveyance of the knowledge of things. For the

CHARACTERS used in Music, and of musical Notes with
 their proportions, are as follow.

♩ character of a large	8	♩ crotchet	$\frac{1}{2}$
♪ a long	4	♪ quaver	$\frac{1}{4}$
♫ a breve	2	♫ semiquaver	$\frac{1}{8}$
♬ a semibreve	1	♬ demisemiquaver	$\frac{1}{16}$
♭ a minim	$\frac{1}{2}$		

character of a sharp note: this character at the
 beginning of a line or space, denotes that all the notes
 in that line are to be taken a semitone higher than in
 the natural series; and the same affects all the octaves
 above and below, though not marked: but when pre-
 fixed to any particular note, it shews that note alone
 to be taken a semitone higher than it would be with-
 out such character.

b or b, character of a flat note: this is the contra-
 ry to the other above; that is, a semitone lower.

h character of a natural note: when in a line or
 series of artificial notes, marked at the beginning b or
 #, the natural note happens to be required, it is de-
 noted by this character.

♯ character of the treble cliff.

♭ character of the mean cliff.

♮ bass cliff.

2, or 4 characters of common duple time, signify-
 VOL. III.

ing the measure of two crotchets to be equal to two
 notes, of which four make a semibreve.

C ♯ ♭, characters that distinguish the move-
 ments of common time, the first implying slow, the
 second quick, and the third very quick.

$\frac{1}{2}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{1}{4}$, characters of simple triple time,
 the measure of which is equal to three semibreves, or
 to three minims.

$\frac{4}{8}$, $\frac{6}{8}$, or $\frac{6}{4}$, characters of mixed triple time, where
 the measure is equal to six crotchets, or six qua-
 vers.

$\frac{9}{8}$ or $\frac{3}{2}$, or $\frac{9}{16}$, or $\frac{3}{4}$, or $\frac{3}{8}$, characters of compound
 triple time.

$\frac{1}{12}$, $\frac{8}{12}$, $\frac{1}{6}$, or $\frac{1}{3}$, or $\frac{1}{4}$, characters of that spe-
 cies of triple time called the measure of twelve times.

CHARACTER, in epic and dramatic poetry, that
 which is peculiar in the manners of any person, and
 distinguishes him from all others.

The poetical character, says Mr Boswell, is not pro-
 perly any particular virtue or quality, but a compo-
 sition of several which are mixed together, in a diffe-
 rent degree, according to the necessity of the fable and
 the unity of the action: there must be one, however,
 to reign over all the rest; and this must be found, in
 some degree, in every part. The first quality in
 Achilles, is wrath; in Ulysses, dissimulation; and in
 Æneas, mildness: but as these characters cannot be
 alone, they must be accompanied with others to em-
 bellish them, as far as they are capable, either by
 hiding their defects, as in the anger of Achilles, which
 is palliated by extraordinary valour; or by making
 them center in some solid virtue, as in Ulysses, whose
 dissimulation makes a part of his prudence; and in
 Æneas, whose mildness is employed in a submission to
 the will of the gods. In the making up of which
 union, it is to be observed, the poets have joined to-
 gether such qualities as are by nature the most com-
 patible; valour with anger, piety with mildness, and
 prudence with dissimulation. The fable requires pru-
 dence in Ulysses, and piety in Æneas; in this, there-
 fore, the poets were not left to their choice: but Ho-
 mer might have made Achilles a coward without a-
 bating any thing from the justness of his fable: so that
 it was the necessity of adorning his character that
 obliged him to make him valiant: the character, then,
 of a hero in the epic poem, is compounded of three
 sorts of qualities; the first essential to the fable; the
 second, embellishments of the first; and valour, which
 sustains the other two, makes the third.

Unity of character is as necessary as the unity of
 the fable. For this purpose a person should be the
 same from the beginning to the end: not that he is
 always to betray the same sentiments, or one passion;
 but that he should never speak nor act inconsistently
 with his fundamental character. For instance, the
 weak may sometimes fall into a warmth, and the
 break of the passionate be calm, a change which of-
 ten introduces in the drama a very affecting variety;
 but if the natural disposition of the former was to be
 represented as boisterous, and that of the latter mild
 and soft, they would both act out of character, and
 contradict their persons.

True characters are such as we truly and really see
 in men, or may exist without any contradiction to
 nature:

R r

nature:

Character.

Character. nature: no man questions but there have been men as generous and as good as *Æneas*, as passionate and as violent as *Achilles*, as prudent and wife as *Ulysses*, as impious and atheistical as *Mezentius*, and as amorous and passionate as *Dido*; all these characters, therefore, are true, and nothing but just imitations of nature. On the contrary, a character is false when an author foigns it, that one can see nothing like it in the order of nature wherein he designs it shall stand: these characters should be wholly excluded from a poem, because, transgressing the bounds of probability and reason, they meet with no belief from the readers; they are fictions of the poet's brain, not imitations of nature; and yet all poetry consists in an imitation of nature.

CHARACTER is also used for certain visible qualities, which claim respect or reverence to those vested therewith.—The majesty of kings gives them a *character* which procures respect from the people. A bishop should sustain his *character* by learning and solid piety, rather than by worldly lustre, &c. The law of nations secures the *character* of an ambassador from all insults.

CHARACTERS, among botanists, is synonymous with the definition of the genera of plants.—The term *character* is not extended by Linnæus to the species of plants, because he never gives the complete description of any species; but only enumerates those characters or circumstances in which it differs from all the other species of the same genus. The characters which are known by the sense of sight, are only to be depended on in distinguishing bodies; those which are acquired by the other senses, as the taste and smell, being rarely or never to be admitted as marks of distinction. The characteristic mark of each genus is to be fixed from the figure, situation, connection, number, and proportion, of all the parts*. Linnæus has suggested four different characters; the artificial, the natural, and the habitual; which are all equally applicable to the higher and lower divisions. The first is drawn indiscriminately from different parts of the plant, and admits of more or fewer characteristic marks than are absolutely necessary for distinguishing the classes, genera, and species. Linnæus establishes for a criterion of the artificial character, that it can never distinguish the genera in a natural order; being calculated merely for discriminating such as arrange themselves under the same artificial order. In the sexual system the classical characters are only considered as artificial. The essential character distinguishes one plant from another by means of a single mark so striking and particular as to distinguish the plant in which it is found, from every other, at first sight. It serves to distinguish such genera as arrange themselves under the same natural order. The essential character of the classes and genera ought to be taken from one of the seven parts of fructification; that of the species from any of the other parts; as the stem, leaf, root, buds, &c. The natural character includes the two former, and collects all the possible marks of plants. It is useful, says Linnæus, in every method; lays the foundation of the system; remains unchanged though new genera are daily discovered; and is capable of emendation by the detection of new spe-

cies alone which afford an opportunity of excluding such characteristical marks as are totally superfluous. The habitual character drawn from the habit or port of plants, was the invention of the earlier botanists who knew no better rule for the distribution of vegetables. This character has never been employed but in distinguishing the species; though Linnæus seems to think that it may be used with caution, and in default of other characters, for ascertaining the genera. See **BOTANY**.

CHARACTERISTIC, in the general, is that which *characterizes* a thing, or person, *i. e.* constitutes its *character*, whereby it is distinguished. See **CHARACTER**.

CHARACTERISTIC, is peculiarly used in grammar, for the principal letter of a word: which is preserved in most of its tenes and moods, its derivatives and compounds.

CHARACTERISTIC of a *Logarithm*, is its index or exponent. See **LOGARITHM**.

CHARACTERISTIC Triangle of a *Curve*, in the higher geometry, is a rectilinear right-angled triangle, whose hypotenuse makes a part of the curve, not sensibly different from a right line. It is so called, because curve lines are used to be distinguished hereby. See **CURVE**.

CHARADE, the name of a new species of composition or literary amusement. It owes its name to the idler who invented it. Its subject must be a word of two syllables, each forming a distinct word; and these two syllables are to be concealed in an enigmatical description, first separately, and then together. The exercise of charades, if not greatly instructive, is at least innocent and amusing. At all events, as it has made its way into every fashionable circle, and has employed even Garrick, it will scarcely be deemed unworthy of attention. The silliness indeed of most that have appeared in the papers under this title, are not only destitute of all pleantry in the stating, but are formed in general of words utterly unfit for the purpose. They have therefore been treated with the contempt they deserved. In trifles of this nature, inaccuracy is without excuse. The following examples therefore are at least free from this blemish.

I.

My *first*, however here abused,
 Designs the sex alone;
 In Cambria, such is custom's pow'r,
 'Tis Jenkin, John, or Joan.
 My *second* oft is loudly call'd,
 When men prepare to sit it:
 It's name delights the female ear;
 Its force, may none resist it!
 It binds the weak, it binds the strong,
 The wealthy and the poor;
 Still 'tis to joy a passport deem'd,
 For sullied fame a cure.
 It may insure an age of bliss,
 Yet mil'ries oft attend it;
 To fingers, ears, and noses too,
 Its various lords commend it.
 My *whole* may chance to make one drink,
 Though vendid in a fish-shop;
 'Tis now the monarch of the seas,
 And has been an archbishop.

Her-ring.
 My

Charade

II.

Charadrius.

My *first*, when a Frenchman is learning English, serves him to swear by. My *second*, is either hay or corn. My *whole*, is the delight of the present age, and will be the admiration of posterity. *Gar-rich*.

III.

My *first*, is plowed for various reasons, and grain is frequently buried in it to little purpose. My *second*, is neither riches nor honours; yet the former would generally be given for it, and the latter is often tasteless without it. My *whole* applies equally to spring, summer, autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. *Sea-sun*.

IV.

My *first*, with the most rooted antipathy to a Frenchman, prides himself, whenever they meet, upon sticking close to his jacket. My *second* has many virtues, nor is it its least that it gives name to my *first*. My *whole*, may I never catch! *Tar-tar*.

V.

My *first* is one of England's prime boasts; it rejoices the ear of a horse, and anguishes the toe of a man. My *second*, when brick, is good, when stone, better; when wooden, best of all. My *whole* is famous alike for rottenness and tin. *Corn-wall*.

VI.

My *first* is called bad or good,
May pleasure or offend ye;
My *second*, in a thirsty mood,
May very much besfriend ye.
My *whole*, tho' styled "a cruel word,"
May yet appear a kind one;
It often may with joy be heard,
With tears may often blind one. *Fare-well*.

VII.

My *first* is equally friendly to the thief and the lover, the toper, and the student. My *second* is light's opposite: yet they are frequently seen hand in hand; and their union, if judicious, gives much pleasure. My *whole*, is tempting to the touch, grateful to the sight, fatal to the taste. *Night-shade*.

CHARADRIUS, in ornithology, a genus belonging to the order of grallæ. The beak is cylindrical and blunt; the nostrils are linear; and the feet have three toes. There are 12 species, *viz*.

1. The *Hiaticula*, or Sea-lark of Ray, has a black breast; a white streak along the front; the top of the head is brown; and the legs and beak are reddish. It is found on the shores of Europe and America. They frequent our shores in the summer, but are not numerous. They lay four eggs, of a dull whitish colour, sparingly sprinkled with black: at approach of winter they disappear.

2. The *Alexandrinus*, or Alexandrian Dotterel, is of a brownish colour, with the forehead, collar, and belly white; the prime tail-feathers on both sides are white; and the legs are black. It is about the size of a lark, and lives upon insects.

3. The *Vociferus*, or Noisy Plover of Cateby, has black streaks on the breast, neck, forehead, and cheeks; and the feet are yellow. It is a native of North America.

4. The *Ægyptius* has a black streak on the breast, white eye-brows, the prime tail-feathers streaked with black at the points, and bluish legs. It is found in the plains of Egypt, and feeds on insects.

5. The *Morinellus* has an iron-coloured breast, a small white streak on the breast and eye-brows, and black legs. It is the Dotterel of Ray, and a native of Europe. They are found in Cambridgeshire, Lincolnshire, and Derbyshire: on Lincoln-heath, and on the moors of Derbyshire, they are migratory; appearing there in small flocks of eight or ten only in the latter end of April, and stay there all May and part of June, during which time they are very fat, and much esteemed for their delicate flavour. In the months of April and September, they are taken on the Wiltshire and Berkshire downs: they are also found in the beginning of the former month on the sea-side at Mcale in Lancashire, and continue there about three weeks, attending the barley fallows: from thence they remove northward to a place called *Leyton Hawi*, and stay there about a fortnight; but where they breed, or where they reside during the winter, we have not been able to discover. They are reckoned very foolish birds, so that a dull fellow is proverbially styled a *dotterel*. They were also believed to mimic the action of the fowler, to stretch out a wing when he stretches out an arm, &c. continuing their imitation, regardless of the net that is spreading for them.

To this method of taking them, Michael Drayton alludes in his panegyrical verses on *Coryate's Crudities*:

Most worthy man, with thee it is ev'n thus,
As men take *dotterels*, so hast thou ta'en us;
Which as a man his arm or leg doth set,
So this fond bird will likewise counterfeit.

At present sportsmen watch the arrival of the dotterels, and shoot them; the other method having been long disused.

6. The *Apricarius* has a black belly; the body is brown, and variegated with white and yellow spots; and the legs are ash-coloured. It is the spotted Plover of Edwards, and a native of Canada.

7. The *Pluvialis* is black above, with green spots, white underneath, and the feet are ash-coloured. It is the green Plover of Ray, and is a native of Europe. They lay four eggs, sharply pointed at the lesser end, of a dirty white colour, and irregularly marked, especially at the thicker end, with blotches and spots. It breeds on several of our unfrequented mountains; and is very common on those of the isle of Rum, and others of the loftier Hebrides. They make a shrill whistling noise; and may be enticed within shot by a skilful imitator of the note.

8. The *Torquatus* has a black breast, and a white front; the top of the head and the collar is black; and the beak and feet are bluish. It is a native of St Domingo.

9. The *Calidris* has black feet, and a black bill; the rump is greyish; and the body is pure white below. It frequents the shores of Europe.

10. The *Ædicnemus*, or Stone-curlew of Ray, is of a grey colour, with two of the prime wing-feathers black, but white in the middle; it has a sharp bill, and ash-coloured feet; and is about the size of a crow. In Hampshire, Norfolk, and on Lincoln-heath, it is

Charaims
|
Charcoal.

called the stone-curler, from a similarity of colours to the curler. It breeds in some places in rabbit-burrows; also among stones on the bare ground, laying two eggs of a copper colour spotted with a darker red. The young run soon after they are hatched. These birds feed in the night on worms and caterpillars: they will also eat toads, and will catch mice. They inhabit fallow lands and downs; affect dry places, never being seen near any waters. When they fly, they extend their legs straight out behind: are very shy birds; run far before they take to wing; and often squat: are generally seen single; and are esteemed very delicate food. — Hasselquist informs us, that this bird is also "met with in Lower Egypt, in the Acacia groves, near the villages Abufir and Sackhara, near the sepulchres of the ancient Egyptians, and in the deserts. The Arabians call it Kervan. It has a shrill voice, somewhat resembling that of the black woodpecker which it raises and lowers successively, uttering agreeable notes. The Turks and Egyptians value it much if they can get it alive; and keep it in a cage for the sake of its singing. Its flesh is hard, and of a very good taste, inclined to aromatic. It is a very voracious bird, catching and devouring rats and mice, which abound in Egypt. It seldom drinks; and when taken young, and kept in a cage in Egypt, they give it no water for several months, but feed it with fresh meat macerated in water, which it devours very greedily. It is found in deserts, and is therefore accustomed to be without water.

11. The Himantopus is white below, with a black back, and a long black bill; the feet are red, and very long. It is the autumnal dotterel of the English authors, and frequents the sea-shores of Europe. It is also found in the lakes of Egypt in the month of October.

12. The Spinus, armed Dotterel, or Lapwing, has a black breast, legs, and wings; it has a crest on the hinder part of the head. It is of the size of a pigeon; the French call it *dominicanus*, from the resemblance it has to the dress of a Dominican monk. It is a native of Egypt.

CHARAIMS, a sect of the Jews in Egypt. They live by themselves, and have a separate synagogue; and as the other Jews are remarkable for their eyes, so are those for their large noses, which run through all the families of this sect. These are the ancient Essenes. They strictly observe the five books of Moses, according to the letter; and receive no written traditions. It is said that the other Jews would join the Charaims; but those not having observed the exact rules of the law with regard to divorces, these think they live in adultery.

CHARANTIA, in botany. See MOMORDICA.

CHARBON, in the menage, that little black spot or mark which remains after a large spot in the cavity of the corner teeth of a horse: about the seventh or eighth year when the cavity fills up, the tooth being smooth and equal, it is said to be rased.

CHARCAS, the southern division of Peru in South America, remarkable for the silver mines of Potosi.

CHARCOAL, a sort of artificial coal, or fuel, consisting of wood half burnt; chiefly used where a clear strong fire, without smoke, is required; the humidity

of the wood being here mostly dissipated, and exhaled in the fire wherein it is prepared.

The microscope discovers a surprising number of pores in charcoal: they are diffused in order, and traverse it lengthwise; so that there is no piece of charcoal, how long soever, but may be easily blown through. If a piece be broken pretty short, it may be seen through with a microscope. In a range the 18th part of an inch long, Dr Hook reckoned 150 pores; whence he concludes, that in a charcoal of an inch diameter, there are not less than 5,724,000 pores. It is to this prodigious number of pores, that the blackness of charcoal is owing: for the rays of light striking on the charcoal, are received and absorbed in its pores, instead of being reflected; whence the body must of necessity appear black, blackness in a body being no more than a want of reflection. Charcoal was anciently used to distinguish the bounds of estates and inheritances; as being incorruptible, when let very deep within ground. In effect, it preserves itself so long, that there are many pieces found entire in the ancient tombs of the northern nations. M. Dodart says, there is charcoal made of corn, probably as old as the days of Cæsar: he adds, that it has kept so well, that the wheat may be still distinguished from the rye; which he looks on as a proof of its incorruptibility.

The operation of charring wood, is performed in the following manner: The wood intended for this purpose is cut into proper lengths, and piled up in heaps near the place where the charcoal is intended to be made: when a sufficient quantity of wood is thus prepared, they begin constructing their stacks, for which there are three methods. The first is this: They level a proper spot of ground, of about twelve or fifteen feet in diameter, near the piles of wood; in the center of this area a large billet of wood, split across at one end and pointed at the other, is fixed with its pointed extremity in the earth, and two pieces of wood inserted through the clefts of the other end, forming four right-angles; against these cross pieces four other billets of wood are placed, one end on the ground, and the other leaning against the angles.

This being finished, a number of large and straight billets are laid on the ground to form a floor, each being as it were the radius of the circular area: on this floor a proper quantity of brush or small wood is strewed, in order to fill up the interstices, when the floor will be complete; and in order to keep the billets in the same order and position they were first arranged, pegs or flumps are driven into the ground in the circumference of the circle, about a foot distant from one another: upon this floor a stage is built with billets set upon one end, but something inclining towards the central billet; and on the tops of these another floor is laid in a horizontal direction, but of shorter billets, as the whole is, when finished, to form a cone.

The second method of building the stacks for making charcoal is performed in this manner: A long pole is erected in the center of the area above described, and several small billets ranged round the pole on their ends: the interstices between these billets and the pole is filled with dry brush-wood, then a floor is laid, on that a stage in a reclining position, and on that a second

Charenel.

Charcoal.

Charcoal.

cond floor, &c. in the same manner as described above; but in the lower floor there is a billet larger and longer than the rest, extending from the central pole to some distance beyond the circumference of the circle.

The third method is this: A chimney, or aperture of a square form, is built with billets in the center, from the bottom to the top; and round these, floors and inclined stages are erected, in the same manner as in the stacks above described, except that the base of this, instead of being circular like the others, is square; and the whole stack, when completed, forms a pyramid.

The stack of either form being thus finished, is covered over with turf, and the surface plastered with a mixture of earth and charcoal-dust well tempered together.

The next operation is the setting the stack on fire. In order to this, if it be formed according the first construction, the central billet in the upper stage is drawn out, and some pieces of very dry and combustible wood are placed in the void space, called, by workmen, the chimney, and fire set to these pieces. If the stack be built according to the second construction, the central pole is drawn out, together with the large horizontal billet above described; and the void space occupied by the latter being filled with pieces of very dry combustible wood, the fire is applied to it at the base of the stack. With regard to the third construction, the square aperture or chimney is filled with small pieces of very dry wood, and the fire applied to it at the top or apex of the pyramidal stack. When the stack is set on fire, either at the top or bottom, the greatest attention is necessary in the workman; for in the proper management of the fire the chief difficulty attending the art of making good charcoal consists. In order to this, care is taken, as soon as the flame begins to issue some height above the chimney, that the aperture be covered with a piece of turf, but not so close as to hinder the smoke from passing out: and whenever the smoke appears to issue very thick from any part of the pile, the aperture must be covered with a mixture of earth and charcoal dust. At the same time time, as it is necessary that every part of the stack should be equally burnt, it will be requisite for the workman to open vents in one part and shut them in another. In this manner the fire must be kept up till the charcoal be sufficiently burnt, which will happen in about two days and a half, if the wood be dry; but if green, the operation will not be finished in less than three days. When the charcoal is thought to be sufficiently burnt, which is easily known from the appearance of the smoke, and the flames no longer issuing with impetuosity through the vents; all the apertures are to be closed up very carefully with a mixture of earth and charcoal-dust, which, by excluding all access of the external air, prevents the coals from being any further consumed, and the fire goes out of itself. In this condition it is suffered to remain, till the whole is sufficiently cooled; when the cover is removed, and the charcoal is taken away. If the whole process is skilfully managed, the coals will exactly retain the figure of the pieces of wood: some are said to have been so dextrous, as to char an arrow without altering even the figure of the feather.

There are considerable differences in the coals of different vegetables, in regard to their habitude to fire: the very light coals of linen, cotton, fume fungi, &c. readily catch fire from a spark, and soon burn out; the more dense ones of woods and roots are set on fire more difficultly, and burn more slowly: the coals of the black berry-bearing alder, of the hazel, the willow, and the lime-tree, are said to answer best for the making of gunpowder and other pyrotechnical compositions, perhaps from their being easily inflammable: for the reduction of metallic calces those of the heavier woods, as the oak and the beech, are preferable, these seeming to contain a larger proportion of the phlogistic principle, and that, perhaps, in a more fixed state: considered as common fuel, those of the heavy woods give the greatest heat, and require the most plentiful supply of air to keep them burning; those of the light woods preserve a glowing heat, without much draught of air, till the coals themselves are consumed; the bark commonly crackles and flies about in burning, which the coal of the wood itself very seldom does.

Mathematical-instrument makers, engravers, &c. find charcoal of great use to polish their brass, and copper-plates after they have been rubbed clean with powdered pumice-stone. Plates of horn are polishable in the same way, and a gloss may be afterwards given with tripoli.

The coals of different substances are also used as pigments; hence the bone-black, ivory-black, &c. of the shops. Most of the paints of this kind, besides their incorruptibility, have the advantage of a full colour, and work freely in all the forms in which powdery pigments are applied; provided they have been carefully prepared, by thoroughly burning the subject in a close vessel, and afterwards grinding the coal into a powder of due fineness. Pieces of charcoal are used also in their entire state for tracing the outlines of drawings, &c.; in which intention they have an excellence, that their mark is easily wiped out. For these purposes, either the finer pieces of common charcoal are picked out and cut to a proper shape; or the pencils are formed of wood, and afterwards burnt into charcoal in a proper vessel well covered. The artists commonly make choice of the smaller branches of the tree freed from the bark and pith; and the willow and vine are preferred to all others. This choice is confirmed by the experiments of Dr Lewis, who has found that the wood of the trunks of trees produces charcoal of a harder nature than their small twigs or branches; and the hard woods, such as box and guaiacum, produced coals very sensibly harder than the softer woods. Willow he prefers to all others. The shells and stones of fruits yielded coals so hard that they would scarce mark on paper at all; while the coals of the kernels of fruits were quite soft and mellow. The several coals produced by the doctor's experiments, were levigated into fine powder, mixed both with gum-water and oil, and applied as paints both thin and thick, and diluted with different degrees of white. All of them, when laid on thick, appeared of a strong full black, nor could it be judged that one was of a finer colour than another; diluted with white, or when spread thin, they had all somewhat of a bluish cast.

Horns,

Chardin
||
Charge.

Horns, and the bones both of fishes and land-animals, gave coals rather glossier and deeper-coloured than vegetables; and which, in general, were very hard, so as difficulty, or not at all, to stain paper. Here also the hardnels of the coal seemed to depend on that of the subject from whence it was prepared; for silk, woollen, leather, blood, and the fleshy parts of animals, yielded soft coals. Some of these differed from others very sensibly in colour: that of ivory is superior to all the rest, and undistubably the finest of all the charcoal blacks. The animal coals had much less of the bluish cast in them than the vegetable, many of them inclining rather to a brown. Charred pit-coal, on the other hand, seemed to have this blueness in a greater degree.

Charcoal is not soluble in any of the acids; but may be dissolved in considerable quantities by a solution of *hyper sulphuris*, to which it communicates a green colour. Melted with colourless fritts or glasses, it gives a pale yellow, dark yellow, reddish, brownish, or blackish colour, according as the inflammable matter is in greater or less proportion; as the phlogiston, or inflammable matter of the coal, seeming to be the direct tinging substance. When the phlogistic matter is thus diffused through glass, it is no more affected by continued strong fire than charcoal is when excluded from the air.

The vapour of burning charcoal is found to be highly noxious, being no other than *fixed air*. How this affects the animal system is explained under the article *Blood*, n° 30, 3r.

CHARDIN (Sir John), a celebrated traveller, was born at Paris in 1642. His father, who was a jeweller, had him educated in the Protestant religion; after which he travelled into Persia and India. He traded in jewels, and died at London in 1713. The account he wrote of his travels is much esteemed.

CHARENTON, the name of two towns of France, the one upon the Marmaude in the Bourbonnois; the other in the isle of France, near the confluence of the Marne with the Seine.

CHARES the Lydian, a celebrated statuary, was the disciple of Lyfippus; and made the famous Colossus of the sun in the city of Rhodes. Flourished 288 years before Christ.

CHARGE, in gunnery, the quantity of powder and ball wherewith a gun is loaded for execution.

The rules for charging large pieces in war are, That the piece be first cleaned or scoured within: that the proper quantity of powder be next driven in and rammed down; care, however, being taken, that the powder, in ramming, be not bruised, because that weakens its effect: that a little quantity of paper, hay, lint, or the like, be rammed over it; and that the ball or shot be intruded. If the ball be red-hot, a tompon, or trencher of green wood, is to be driven in before it. The common allowance for a charge of powder of a piece of ordnance, is half the weight of the ball. In the British navy, the allowance for 32 pounders is but seven sixteenths of the weight of the bullet. But a late author is of opinion, that if the powder in all ship cannon whatever, was reduced to one-third weight of the ball, or even less, it would be of considerable advantage, not only by saving ammunition, but by keep-

ing the guns cooler and quieter, and at the same time more effectually injuring the vessels of the enemy. With the present allowance of powder the guns are heated, and their tackle and furniture strained; and this only to render the bullets less efficacious: for a bullet which can but just pass through a piece of timber, and loses almost all its motion thereby, has a much better chance of rending and fracturing it, than if it passes through with a much greater velocity.

CHARGE, in heraldry, is applied to the figures represented on the escutcheon, by which the bearers are distinguished from one another; and it is to be observed, that too many charges are not so honourable as fewer.

CHARGE of Lead, denotes a quantity of 36 pgs. See *FIG.*

CHARGE to enter Heir, in Scots law, a writing passing under the signet, obtained at the instance of a creditor, either against the heir of his debtor, for fixing upon him the debt as representing the debtor, which is called a general charge: or, against the debtor himself, or his heir, for the purpose of vesting him in the right of any heritable subject to which he has made up no title, in order the creditor may attach that subject for payment of his debt, in the same manner as if his debtor or his heir were legally vested in it by service or otherwise. This last kind is called a *special charge*.

CHARGED, in heraldry, a shield carrying someimpresa or figure, is said to be charged therewith; so also, when one bearing, or charge, has another figure added upon it, it is properly said to be charged.

CHARGED, in electrical experiments, is when a vial, pane of glass, or other electric substance, properly coated on both sides, has a quantity of electricity communicated to it; in which case the one side is always electrified positively, and the other negatively.

CHARIOT, a half coach, having only a seat behind, with a stool, at most, before. See *СОАЩ*.

The chariots of the ancients, chiefly used in war, were called by the several names *bigea*, *trigæ*, &c. according to the number of horses applied to draw them. Every chariot carried two men, who were probably the warrior and the charioteer; and we read of several men of note and valour employed in driving the chariot. When the warriors came to encounter in close fight, they alighted out of the chariot, and fought on foot; but when they were weary, which often happened by reason of their armour, they retired into their chariot, and thence annoyed their enemies with darts and missive weapons. These chariots were made so strong, that they lasted for several generations.

Besides this sort, we find frequent mention of the *currus falcati*, or those chariots armed with hooks, or scythes, with which whole ranks of soldiers were cut off together, if they had not the art of avoiding the danger; these were not only used by the Persians, Syrians, Egyptians, &c. but we find them among the ancient Britons; and notwithstanding the imperfect state of some of the most necessary arts among that nation before the invasion of the Romans, it is certain that they had war-chariots in great abundance. By the Greek and Roman historians, these chariots are described by the
fix

Chariots
I
Chariota.

six following names; *viz.* Benna, Petoritum, Currus or Carrus, Covinus, Effedum, and Rheda. The benna seems to have been a chariot designed rather for travelling than war. It contained two persons, who were called *combenones*, from their sitting together in the same machine. The petoritum seems to have been a larger kind of chariot than the benna; and is thought to have derived its name from the British word *pet-war*, signifying *four*; this kind of carriage having four wheels. The carrus or currus was the common cart or waggon. This kind of chariot was used by the ancient Britons, in times of peace, for the purposes of agriculture and merchandise; and, in time of war, for carrying their baggage, and wives and children, who commonly followed the armies of all the Celtic nations. The covinus was a war-chariot, and a very terrible instrument of destruction; being armed with sharp scythes and hooks for cutting and tearing all who were so unhappy as to come within its reach. This kind of chariot was made very slight, and had few or no men in it besides the charioteer; being designed to drive with great force and rapidity, and to do execution chiefly with its hooks and scythes. The effedum and rheda were also war-chariots, probably of a large size, and stronger made than the covinus, designed for containing a charioteer for driving it, and one or two warriors for fighting. The far greatest number of the British war-chariots seem to have been of this kind. These chariots, as already observed, were to be found in great numbers among the Britons; inasmuch that Cæsar relates that Cassibelanus, after dismissing all his other forces, retained no fewer than 4000 of these war-chariots about his person. The same author relates, that, by continual experience, they had at last arrived at such perfection in the management of their chariots, that "in the most steep and difficult places they could stop their horses upon full stretch, turn them which way they pleased, run along the pole, rest on the harness, and throw themselves back into their chariots, with incredible dexterity."

CHARIOTS, in the heathen mythology, were sometimes consecrated to the sun; and the scripture observes, that Jothab burnt those which had been offered to the sun by the king's predecessors. This superstitious custom was an imitation of the heathens, and principally of the Persians, who had horses and chariots consecrated in honour of the sun. Herodotus, Xenophon, and Quintus Curtius, speak of white chariots crowned, which were consecrated to the sun, among the Persians, which in their ceremonies were drawn by white horses consecrated to the same luminary.

Triumphal CHARIOT, was one of the principal ornaments of the Roman celebration of a victory.

The Roman triumphal chariot was generally made of ivory, round like a tower, or rather of a cylindrical figure; it was sometimes gilt at the top, and ornamented with crowns; and, to represent a victory more naturally, they used to stain it with blood. It was usually drawn by four white horses; but oftentimes by lions, elephants, tigers, bears, leopards, dogs, &c.

CHARISIA, in the heathen theology, a wake, or night-festival, instituted in honour of the graces. It

continued the whole night, most of which time was spent in dancing; after which, cakes made of yellow flour mixed with honey, and other sweetmeats, were distributed among the assistants.—*Charisia* is also sometimes used to signify the sweetmeats used on such occasions.

CHARISIUS, in the heathen theology, a surname given to Jupiter. The word is derived from *χαρις*, *gratia*, "grace" or "favour;" he being the god by whose influence men obtain the favour and affection of one another. On which account the Greeks used at their meals to make a libation of a cup to Jupiter Charisius.

CHARISTA, a festival of the ancient Romans, celebrated in the month of February, wherein the relations by blood and marriage met, in order to preserve a good correspondence; and that, if there happened to be any difference among them, it might be the more easily accommodated, by the good-humour and mirth of the entertainment. *Ovid, Fasti*, i. 617.

CHARITY, among divines, one of the three grand theological virtues, consisting in the love of God and of our neighbour, or the habit and disposition of loving God with all our heart, and our neighbour as ourselves.

CHARITY is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, assistance or the like.

CHARITY-Schools, are schools erected and maintained in various parishes by the voluntary contributions of the inhabitants, for teaching poor children to read, write, and other necessary parts of education. See SCHOOL.

CHARITY of *St Hippolitus*, a religious congregation founded about the end of the XIVth century, by one Bernardin Alvarez, a Mexican, in honour of *St Hippolitus* the martyr, patron of the city of Mexico; and approved by Pope Gregory XIII.

CHARITY of *our Lady*, in church-history, a religious order in France, which, though charity was the principal motive of their union, grew in length of time so disorderly and irregular, that their order dwindled, and at last became extinct.

There is still at Paris a religious order of women, called "Nuns hospitaliers of the charity of our lady." The religious of this hospital are by vow obliged to administer to the necessities of the poor and the sick, and those only women.

CHARLATAN, or CHARLETAN, signifies an empiric or quack, who retails his medicines on a public stage, and draws people about him with his buffooneries, feats of activity, &c. The word, according to Calpine, comes from the Italian *certano*; of *Cereto*, a town near Spoleto in Italy, where these impostors are said to have first risen. Menage derives it from *charlatano*, and that from *circulatorius*, of *circulator*, a quack.

CHARLEMAGNE, or Charles I. king of France by succession, and emperor of the west by conquest in 800, (which laid the foundation of the dynasty of the western Franks, who ruled the empire 472 years, till the time of Radolphus Aufpurgensis, the founder of the house of Austria). Charlemagne was as illustrious in the cabinet as in the field; and, though he could not write his name, was the patron of men of letters, the restorer of learning, and a wise legislator: he wanted only the virtue of humanity to render him the most accomplished

Charissus.
I

Charlemont
||
Charles V.

accomplished of men; but when we read of his beheading 4500 Saxons, solely for their loyalty to their prince, in opposing his conquests, we cannot think he merits the extravagant encomiums bestowed on him by some historians. He died in 814, in the 74th year of his age, and 47th of his reign.

France had nine sovereigns of this name, of whom Charles V. merited the title of "the wife," (crowned in 1364, died in 1380): and Charles VIII. signalized himself in the field by rapid victories in Italy; crowned 1483, died in 1498. The rest do not deserve particular mention in this place. See (*History of*) FRANCE.

CHARLEMONT, a town of the province of Namur in the Austrian Netherlands, about 18 miles south of Namur. E. Long. 4. 40. N. Lat. 50. 10.

CHARLEMONT is also the name of a town of Ireland, situated on the river Blackwater, in the county of Armagh, and province of Ulster, about six miles south-east of Dungannon. W. Long. 6. 50. N. Lat. 50. 16.

CHARLEROY, a strong town in the province of Namur, in the Austrian Netherlands, situated on the river Sambre, about 19 miles west of Namur. E. Long. 4. 20. N. Lat. 50. 30.

CHARLES MARTEL, a renowned conqueror in the early annals of France. He deposed and restored Chilperic king of France; and had the entire government of the kingdom, once with the title of mayor of the palace, and afterwards as duke of France; but he would not accept the crown. He died, regretted, in 741.

CHARLES *le Gros*, emperor of the west in 881, king of Italy and Suabia, memorable for his reverse of fortune; being dethroned at a diet held near Mentz, by the French, the Italians, and the Germans, in 887: after which he was obliged to subsist on the bounty of the archbishop of Mentz. He died in 888.

CHARLES V. (emperor and king of Spain), was son of Philip I. archduke of Austria, and of Jane queen of Castile. He was born at Ghent, February 24. 1500; and succeeded to the crown of Spain in 1517. Two years afterwards he was chosen emperor at Francfort after the death of Maximilian his grandfather. He was a great warrior and politician: and his ambition was not satisfied with the many kingdoms and provinces he possessed; for he is supposed, with reason, to have aspired at universal empire. He is said to have fought 60 battles, in most of which he was victorious. He took the king of France (Francis I.) prisoner, and sold him his liberty on very hard terms: yet afterwards, when the people of Ghent revolted, he asked leave to pass through his dominions; and though the generous king thus had him in his power, and had an opportunity of revenging his ill-treatment, yet he received and attended him with all pomp and magnificence. He sacked Rome, and took the Pope prisoner; and the cruelties which his army exercised there are said to have exceeded those of the northern barbarians. Yet the pious emperor went into mourning on account of this conquest; forbade the ringing of bells; commanded processions to be made, and prayers to be offered up, for the deliverance of the Pope his prisoner; yet did not inflict the least punishment

on those who treated the holy father and the holy see with such inhumanity. He is acented by some Romish writers of favouring the Lutheran principles, which he might easily have extirpated. But the truth is, he found his account in the divisions which that sect occasioned; and he for ever made his advantage of them, sometimes against the Pope, sometimes against France, and at other times against the empire itself. He was a great traveller, and made 50 different journeys into Germany, Spain, Italy, Flanders, France, England, and Africa. Though he had been successful in many unjust enterprises, yet his last attempt on Metz, which he besieged with an army of 100,000 men, was very just and very unsuccessful.

Vecked at the reverse of fortune which seemed to attend his latter days, and oppressed by sickness, which unfitted him any longer from holding the reins of government with steadiness, or to guide them with address, he resigned his dominions to his brother Ferdinand and his son Philip; and retreated to the monastery of St. Justus near Placentia in Estremadura.

When Charles entered this retreat, he formed such a plan of life for himself as would have suited a private gentleman of moderate fortune. His table was neat, but plain; his domestics few; his intercourse with them familiar; all the cumbersome and ceremonious forms of attendance on his person were entirely abolished, as destructive of that social ease and tranquillity which he courted in order to sooth the remainder of his days. As the mildness of the climate, together with his deliverance from the burdens and cares of government, procured him at first a considerable remission from the acute pains of the gout, with which he had been long tormented, he enjoyed perhaps more complete satisfaction in this humble solitude than all his grandeur had ever yielded him. The ambitious thoughts and projects which had so long engrossed and disquieted him, were quite effaced from his mind. Far from taking any part in the political transactions of the princes of Europe, he restrained his curiosity even from an inquiry concerning them; and he seemed to view the busy scene which he had abandoned with all the contempt and indifference arising from his thorough experience of its vanity, as well as from the pleasing reflection of having disentangled himself from its cares.

Other amusements, and other objects, now occupied him. Sometimes he cultivated the plants in his garden with his own hands; sometimes he rode out to the neighbouring wood on a little horse, the only one that he kept, attended by a single servant on foot. When his infirmities confined him to his apartment, which often happened, and deprived him of these more active recreations, he either admitted a few gentlemen who resided near the monastery to visit him, and entertained them familiarly at his table; or he employed himself in studying mechanical principles, and in forming curious works of mechanism, of which he had always been remarkably fond, and to which his genius was peculiarly turned. With this view he had engaged Turriano, one of the most ingenious artists of that age, to accompany him in his retreat. He laboured together with him in framing models of the most useful machines, as well as in making experiments with regard

Charles V.

Charles. regard to their respective powers; and it was not seldom that the ideas of the monarch assisted or perfected the inventions of the artist. He relieved his mind at intervals with lighter and more fantastic works of mechanism, in fashioning puppets, which, by the structure of internal springs, mimicked the gestures and actions of men, to the no small astonishment of the ignorant monks, who, beholding movements which they could not comprehend, sometimes distrusted their own senses, and sometimes suspected Charles and Turriano of being in compact with invisible powers. He was particularly curious with regard to the construction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is said, with a mixture of surprise as well as regret on his own folly, in having bestowed so much time and labour in the more vain attempt of bringing mankind to a precise uniformity of sentiment concerning the intricate and mysterious doctrines of religion.

But in what manner sever Charles disposed of the rest of his time, he constantly reserved a considerable portion of it for religious exercises. He regularly attended divine service in the chapel of the monastery every morning and evening; he took great pleasure in reading books of devotion, particularly the works of St Augustine and St Bernard; and conversed much with his confessor, and the prior of the monastery, on pious subjects. Thus did Charles pass the first year of his retreat in a manner not unbecoming a man perfectly disengaged from the affairs of this present life, and standing on the confines of a future world, either in innocent amusements which soothed his pains, and relieved a mind worn out with excessive application to business; or in devout occupations, which he deemed necessary in preparing for another state.

But, about six months before his death, the gout, after a longer intermission than usual, returned with a proportional increase of violence. His shattered constitution had not strength enough remaining to withstand such a shock. It enfeebled his mind as much as his body; and from this period we hardly discern any traces of that sound and masculine understanding which distinguished Charles among his contemporaries. An illiberal and timid superstition depressed his spirit. He had no relish for amusements of any kind. He endeavoured to conform, in his manner of living, to all the rigour of monastic austerity. He desired no other society than that of monks, and was almost continually employed in chanting with them the hymns of the missal. As an expiation for his sins, he gave himself the discipline in secret with such severity, that the whip of cords which he employed as the instrument of his punishment, was found, after his decease, tinged with his blood. Nor was he satisfied with these acts of mortification, which, however severe, were not unexampled. The timorous and distrustful solicitude which always accompanies superstition, still continued to disquiet him, and depreciating all that he had done, prompted him to aim at something extraordinary, at some new and, singular act of piety that would display his zeal, and merit the favour of heaven. The act on which he fixed was as wild and

uncommon as any that superstition ever suggested to a disordered fancy. He resolved to celebrate his own obsequies before his death. He ordered his tomb to be erected in the chapel of the monastery. His domestics marched thither in funeral procession, with black tapers in their hands. He himself followed in his shroud. He was laid in his coffin with much solemnity. The service for the dead was chanted; and Charles joined in the prayers which were offered up for the rest of his soul, mingled his tears with those which his attendants shed, as if they had been celebrating a real funeral. The ceremony closed with sprinkling holy water on the coffin in the usual form, and, all the assistants retiring, the doors of the chapel were shut. Then Charles rose out of the coffin, and withdrew to his apartment, full of those awful sentiments which such a singular solemnity was calculated to inspire. But either the fatiguing length of the ceremony, or the impression which this image of death left on his mind, affected him so much, that next day he was seized with a fever. His feeble frame could not long resist its violence; and he expired on the 21st of September, after a life of 58 years, six months, and 21 days.

CHARLES I. } Kings of Britain. See BRITAIN,
CHARLES II. } n° 49,—254.

CHARLES XII. king of Sweden, was born in 1682. By his father's will, the administration was lodged in the hands of the queen-dowager Eleonora with five senators, till the young prince was 18: but he was declared major at 15, by the states convened at Stockholm. The beginning of his administration raised no favourable ideas of him, as he was thought both by Swedes and foreigners to be a person of mean capacity. But the difficulties that gathered round him, soon afforded him an opportunity to display his real character. Three powerful princes, Frederic king of Denmark, Augustus king of Poland and elector of Saxony, and Peter the Great czar of Muscovy, presuming on his youth, conspired his ruin almost at the same instant. Their measures alarming the council, they were for diverting the storm by negotiations; but Charles, with a grave resolution that astonished them, said, "I am resolved never to enter upon an unjust war, nor to put an end to a just one but by the destruction of my enemies. My resolution is fixed: I will attack the first who shall declare against me; and when I have conquered him, I may hope to strike a terror into the rest." The old counsellors received his orders with admiration; and were still more surprised when they saw him on a sudden renounce all the enjoyments of a court, reduce his table to the utmost frugality, dress like a common soldier, and, full of the ideas of Alexander and Cæsar, propose those two conquerors for his models in every thing but their vices. The king of Denmark began by ravaging the territories of the duke of Holstein. Upon this, Charles carried the war into the heart of Denmark; and made such a progress, that the king of Denmark thought it best to accept of peace, which was concluded in 1700. He next resolved to advance against the king of Poland, who had blocked up Riga. He had no sooner given orders for his troops to go into winter-quarters, than he received advice,

Charles.

that Narva, where count Horne was governor, was besieged by an army of 100,000 Muscovites. This made him alter his measures, and move toward the Czar; and at Narva he gained a surprising victory, which cost him not above 2000 men killed and wounded. The Muscovites were forced to retire from the provinces they had invaded. He pursued his conquests, till he penetrated as far as where the diet of Poland was sitting; when he made them declare the throne of Poland vacant, and elect Stanislaus their king: then making himself master of Saxony, he obliged Augustus himself to renounce the crown of Poland, and acknowledge Stanislaus by a letter of congratulation on his accession. All Europe was surprised with the expeditious finishing of this great negotiation, but more at the disinterestedness of the king of Sweden, who satisfied himself with the bare reputation of this victory, without demanding an inch of ground for enlarging his dominions. After thus reducing the king of Denmark to peace, placing a new king on the throne of Poland, having humbled the emperor of Germany, and protected the Lutheran religion, Charles prepared to penetrate into Muscovy in order to dethrone the Czar. He quickly obliged the Muscovites to abandon Poland, pursued them into their own country, and won several battles over them. The Czar, disposed to peace, ventured to make some proposals; Charles only answered, "I will treat with the Czar at Moscow." When this haughty answer was brought to Peter, he said, "My brother Charles still affects to act the Alexander, but I flatter myself he will not in me find a Darius." The event justified him: for the Muscovites, already beaten into discipline, and under a prince of such talents as Peter, entirely destroyed the Swedish army at the memorable battle of Pultowa, July 8. 1709; on which decisive day, Charles lost the fruits of nine years labour, and of almost 100 battles! The king, with a small troop, pursued by the Muscovites, passed the Boristhenes to Oczakow in the Turkish territories; and from thence, through desert countries, arrived at Bender; where the Sultan, when informed of his arrival, sent orders for accommodating him in the best manner, and appointed him a guard. Near Bender, Charles built a house, and intrenched himself; and had with him 1800 men, who were all clothed and fed, with their horses, at the expense of the Grand Signior. Here he formed a design of turning the Ottoman arms upon his enemies; and is said to have had a promise from the Vizir of being sent into Muscovy with 200,000 men. While he remained here, he insensibly acquired a taste for books: he read the tragedies of Corneille and Racine; with the works of Despreaux, whose satires he relished, but did not much admire his other works. When he read that passage in which the author represents Alexander as a fool and a madman, he tore out the leaf. He would sometimes play at chess: but when he recovered of his wounds, he renewed his fatigues in exercising his men; he tired three horses a day; and those who courted his favour were all day in their hoots. To dispose the Ottoman Porte to this war, he detached about 800 Poles and Cossacks of his retinue, with orders to pass the Neister, that runs by Bender, and

to observe what passed on the frontiers of Poland. The Muscovite troops, dispersed in those quarters, fell immediately upon this little company, and pursued them even to the territories of the Grand Signior. This was what the king expected. His ministers at the Porte excited the Turks to vengeance; but the Czar's money removed all difficulties, and Charles found himself in a manner prisoner among the Tartars. He imagined the sultan was ignorant of the intrigues of his Grand Vizir. Poniatofky undertook to make his complaints to the Grand Signior. The sultan, in answer, some days after, sent Charles five Arabian horses, one of which was covered with a saddle and housings of great riches; with an obliging letter, but conceived in such general terms, as gave reason to suspect that the minister had done nothing without the sultan's consent: Charles therefore refused them. Poniatofky had the courage to form a design of deposing the Grand Vizir; who accordingly was deprived of his dignity and wealth, and banished. The seal of the empire was given to Numan Cuproughly: who persuaded his master, that the law forbid him to invade the Czar, who had done him no injury; but to succour the king of Sweden as an unfortunate prince in his dominions. He sent his majesty 800 purjes, every one of which amounted to 500 crowns, and advised him to return peaceably to his own dominions. Charles rejected this advice, threatening to hang up the bashaws, and shave the beards of any janissaries who brought him such messages; and sent word that he should depend upon the Grand Signior's promise, and hoped to re-enter Poland as a conqueror with an army of Turks. After various intrigues at the Porte, an order was sent to attack this *head of iron*, as he was called, and to take him either alive or dead. He stood a siege in his house, with forty domestics, against the Turkish army; killed no less than 20 janissaries with his own hand; and performed prodigies of valour on a very unnecessary and unwarrantable occasion. But the house being set on fire, and himself wounded, he was at last taken prisoner, and sent to Adrianople; where the Grand Signior gave him audience, and promised to make good all the damages he had sustained. At last, after a stay of above five years, he left Turkey; and, having disguised himself, traversed Wallachia, Transylvania, Hungary, and Germany, attended only by one person; and in 16 days riding, during which time he never went to bed, came to Stralsund at midnight, November 21. 1714. His boots were cut from his swollen legs, and he was put to bed; where when he had slept some hours, the first thing he did was to review his troops, and examine the state of the fortifications. He sent out orders that very day, to renew the war with more vigour than ever. But affairs were now much changed: Augustus had recovered the throne of Poland; Sweden had lost many of its provinces; and was without money, trade, credit, or troops. The kings of Denmark and Prussia seized the island of Rugen; and besieged him in Stralsund, which surrendered; but Charles escaped to Carelskroon. When his country was threatened with invasion by so many princes, he, to the surprise of all Europe, marched into Norway with 20,000 men. A very few

Charles.

Charles's-
Cape
|
Charlock.

few Danes might have stopped the Swedish army ; but such a quick invasion they could not foresee. Europe was yet more at a loss to find the Czar so quiet, and not making a descent upon Sweden, as he had before agreed with his allies. This inaction was the consequence of one of the greatest designs, and at the same time the most difficult of any that were ever formed by the imagination of man. In short, a scheme was set on foot for a reconciliation with the Czar ; for replacing Stanislaus on the throne of Poland ; and setting James the second's son upon that of England, beside restoring the duke of Holstein to his dominions. Charles was pleased with these grand ideas, though without building much upon them, and gave his minister leave to act at large. In the mean time, Charles was going to make a second attempt upon Norway in 1718 ; and he flattered himself with being master of that kingdom in six months ; but he was killed at Frederickshall, a place of great strength and importance, which is reckoned to be the key of that kingdom, as he was examining the works.—This prince experienced the extremes of prosperity and of adversity, without being softened by the one, or disturbed for a moment at the other ; but was a man rather extraordinary than great, and fitter to be admired than imitated. He was honoured by the Turks for his rigid abstinence from wine, and his regularity in attending public devotion. In religion he was a Lutheran, and a strong believer in predestination. He wrote some observations on war, and on his own campaigns from 1700 to 1709 ; but the MS. was lost at the unfortunate battle of Pultowa.

CHARLES'S-CAPE, a promontory of Virginia, in North America, forming the northern head-land of the strait that enters the bay of Chesapeake.

CHARLES'S-FORT, a fortress in the county of Cork, and province of Munster, in Ireland, situated at the mouth of Kinfale harbour. W. Long. 8. 20. and N. Lat. 51. 21.

CHARLES'S-TOWN, or *Charleston*, the capital of South Carolina, in North America, situated on a peninsula formed by Ashley and Cooper rivers, the former of which is navigable for ships twenty miles above the town. W. Long. 79. 0. and N. Lat. 32. 30.

CHARLES'S-WAIN, in astronomy, seven stars in the constellation called *ursa major* or the Great Bear.

CHARLETON, an island at the bottom of Hudson's-bay, in North America, subject to Great Britain. W. Long. 80. 0. and N. Lat. 52. 30.

CHARLETON (Walter), a learned English physician born in 1619, was physician in ordinary to Charles I. and Charles II. one of the first members of the royal society, and president of the college of physicians. He wrote on various subjects ; but at last his narrow circumstances obliged him to retire to the island of Jersey, where he died in 1707.

CHARLOCK, the English name of the *RAPHANUS* ; it is a very troublesome weed among corn, being more frequent than almost any other. There are two principal kinds of it ; the one with a yellow flower, the other with a white. Some fields are particularly subject to be over-run with it, especially those which have been manured with cow-dung alone, that being a manure very favourable to the growth of it. The

farmers in some places are so sensible of this, that they always mix horse-dung with their cow-dung, when they use it for arable land. When barley, as is often the case, is infested with this weed to such a degree as to endanger the crop, it is a very good method to mow down the charlock in May, when it is in flower, cutting it so low as just to take off the tops of the leaves of barley with it ; by this means the barley will get up above the weed ; and people have got four quarters of grain from an acre of such land as would have scarce yielded any thing without this expedient. Where any land is particularly subject to this weed, the best method is to sow it with grafs-seed, and make a pasture of it ; for then the plant will not be troublesome, it never growing where there is a coat of grafs upon the ground.

Queen CHARLOTTE'S ISLAND, an island in the south sea, first discovered by captain Wallis in the Dolphin, in 1767, who took possession of it in the name of King George III. Here is good water, and plenty of cocoa-nuts, palm-nuts, and scurvy-grafs. The inhabitants are of a middle stature, and dark complexion, with long hair hanging over their shoulders ; the men are well made, and the women handsome ; their clothing is a kind of coarse cloth, or matting, which they fasten about their middle.

Queen CHARLOTTE'S ISLANDS, a cluster of south-sea islands discovered in 1767 by captain Carteret. He counted seven, and there were supposed to be many more. The inhabitants of these islands are described as extremely nimble and vigorous, and almost as well qualified to live in the water, as upon land : they are very warlike ; and, on a quarrel with some of captain Carteret's people, they attacked them with great resolution ; mortally wounded the master and three of the sailors ; were not at all intimidated by the firearms ; and at last, notwithstanding the aversion of captain Carteret to shed blood, he was obliged to secure the watering places by firing grape-shot into the woods which destroyed many of the inhabitants. These islands lie in S. Lat. 11°. E. Long. 164°. They are supposed to be the Santa Cruz of Mandana, who died there in 1595.

CHARM, a term derived from the Latin *carmen*, a " verse ;" and used to denote a magic power, or spell, by which, with the assistance of the devil, forcerers and witches were supposed to do wonderful things, far surpassing the power of nature.

CHARNEL, or **CHARNEL-HOUSE**, a kind of portico or gallery, usually in or near a church-yard, over which were anciently laid the bones of the dead, after the flesh was wholly consumed. Charnel-houses are now usually adjoining to the church.

CHARON, in fabulous history, the son of Erebus and Nox, whose office was to ferry the souls of the deceased over the waters of Acheron, for which each soul was to pay a piece of money. For this reason the Pagans had a custom of putting a piece of money into the mouth of the dead, in order that they might have something to pay Charon for their passage.

CHARONDAS, a celebrated legislator of the Thuriars, and a native of Catanea in Sicily, flourished 446 before Christ. He forbade any person's appearing armed in the public assemblies of the nation ; but one

Charlotte's
|
Charondas.

day going thither in haste, without thinking of his sword, he was no sooner made to observe his mistake than he ran it through his body.

CHAROST, a town of France, in Berry, with the title of a duchy. It is seated on the river Arnon, E. Long. 2. 15. N. Lat. 46. 56.

CHAROUX, a town of France, in the Bourbonnois, seated on an eminence, near the river Sioulle. It has two parishes, which are in different dioceses. E. Long. 3. 15. N. Lat. 46. 10.

CHARPENTIER (Francis) dean of the French academy, was born in 1620. His early capacity inclined his friends to educate him for the bar: but he was much more delighted with the study of languages and antiquity, than of the law; and preferred repose to tumult. M. Colbert made use of him in establishing his new academy of medals and inscriptions; and no person of that learned society contributed more than himself toward that noble series of medals which were struck on the considerable events, that distinguished the reign of Lewis XIV. He published several works, which were all well received; and died in 1702.

CHARR, in ichthyology. See **SALMO**.

CHARRON (Peter), the author of a book intitled *Of Wisdom*, which gained him great reputation, was born at Paris in the year 1541. After being advocate in the parliament of Paris for five or six years, he applied himself to divinity; and became to great a preacher, that the bishops of several dioceses offered him the highest dignities in their gift. He died at Paris, suddenly in the street, November 16, 1603.

CHART, or **SEA-CHART**, an hydrographical map, or a projection of some part of the earth's superficies *in plano*, for the use of navigators.

Charts differ very considerably from geographical or land maps, which are of no use in navigation. Nor are sea-charts all of the same kind, some being what we call plane-charts, others mercator-charts, and others globular charts.

Plane CHART, is a representation of some part of the superficies of the terraqueous globe, in which the meridians are supposed parallel to each other, the parallels of latitude at equal distances, and consequently the degrees of latitude and longitude every where equal to each other. See **PLANE CHART**.

Mercator's CHART, is that where the meridians are straight lines, parallel to each other, and equidistant; the parallels are also straight lines, and parallel to each other: but the distance between them increases from the equinoctial towards either pole, in the ratio of the secant of the latitude to the radius. See **NAVIGATION**, Sect. iv.

Globular CHART, a meridional projection, wherein the distance of the eye from the plane of the meridian, upon which the projection is made, is supposed to be equal to the sine of the angle 45°. This projection comes the nearest of all to the nature of the globe, because the meridians therein are placed at equal distances; the parallels also are nearly equidistant, and consequently the several parts of the earth have their proper proportion of magnitude, distance, and situation, nearly the same as on the globe itself. See **GLOBULAR Projection**.

Chorographic CHARTS, descriptions of particular countries. See **CHOROGRAPHY**.

Heliographic CHART, descriptions of the body of the sun, and of the maculae or spots observed in it. See **ASTRONOMY**, n° 14,—18. and 33,—39. and 2^d Plate XLII. fig. 1.

Hydrographic CHARTS, sheets of large paper, whereon several parts of the land and sea are described, with their respective coasts, harbours, sounds, flats, rocks, shelves, sands, &c. together with the longitude and latitude of each place, and the points of the compass. See **MERCATOR's CHART**.

Selenographic CHARTS, particular descriptions of the spots, appearances, and maculae of the moon. See **ASTRONOMY**, n° 19. and 40,—43. and 3^d Plate XLII.

Topographic CHARTS, draughts of some small parts of the earth only, or of some particular places, without regard to its relative situation, as London, York, &c.

CHARTA, or **CARTA**, primarily signifies a sort of paper made of the plant *papyrus* or *biblus*. See **PAPER**, and **CHARTER**.

CHARTA Emporetica, in pharmacy, &c. a kind of paper made very soft and porous, used to filter withal. See **FILTRATION**, &c.

CHARTA is also used in our ancient customs for a charter, or deed in writing. See **CHARTER**.

CHARTA Magna, the great charter, is an ancient instrument, containing several privileges and liberties granted to the church and state by Edward the confessor; together with others relating to the feudal laws of William the conqueror, granted by Henry I.; all confirmed by the succeeding princes above thirty times. See **LAW**, n° 31. par. penult.

CHARTER, in law, a written instrument, or evidence of things acted between one person and another. The word charter comes from the Latin *carta*, anciently used for a public and authentic act, a donation, contract, or the like; from the Greek *χαρτα*, "thick paper" or "pasteboard," whereon public acts were wont to be written. Britton divides charters into those of the king, and those of private persons. 1. Charters of the king, are those whereby the king passeth any grant to any person or body politic, as a *charter of exemption of privilege*, &c.; *charter of pardon*, whereby a man is forgiven a felony, or other offence committed against the king's crown and dignity; *charter of the forest*, wherein the laws of the forest are comprised, such as the charter of Canutus, &c. 2. Charters of private persons, are deeds and instruments for the conveyance of lands, &c. And the purchaser of lands shall have all the charters, deeds, and evidences, as incident to the time, and for the maintenance of his title.

CHARTER-Governments in America. See **COMMONS**.

CHARTER-Land, such land as a person holds by charter; that is, by evidence in writing, otherwise called freehold.

CHARTERPARTY, in commerce, denotes the instrument of freightage, or articles of agreement for the hire of a vessel. See **FREIGHT**, &c.

The *charterparty* is to be in writing; and to be signed both by the proprietor or the master of the ship, and the merchant who freights it. It is to contain the name and the burden of the vessel; those of the master and the freighter; the price or rate of freight; and

Chartophylax *lax* *l* *Charybdis*. the time of loading and unloading; and the other conditions agreed on. It is properly a deed, or policy, whereby the master or proprietor of the vessel engages to furnish immediately a tight sound vessel, well equipped, caulked, and stopp'd, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship with all its furniture, and the cargo, are respectively subjected to the conditions of the *charterparty*. The *charterparty* differs from a *bill of lading*, in that the first is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, or at most only for the voyage one way.

The president Boyer says, the word comes from hence, that *per medium charta incidebatur, et sic fiebat charta partita*; because, in the time when notaries were less common, there was only one instrument made for both parties: this they cut in two, and gave each his portion; and joined them together at their return, to know if each had done his part. This he observes to have been practised in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a staff, each party retaining a moiety thereof as a mark.

CHARTOPHYLAX, the name of an officer of the church of Constantinople, who attends at the door of the rails when the sacrament is administered, and gives notice to the priests to come to the holy table. He represents the patriarch upon the bench, tries all ecclesiastical causes, keeps all the marriage registers, assists at the consecration of bishops, and presents the bishop elect at the solemnity, and likewise all other subordinate clergy. This office resembles in some shape that of the *bibliothecarius* at Rome.

CHARTRES, a large city of France, in the province of Orleans, situated on the river Eure, in E. Long. 1. 32. N. Lat. 48. 47. It is a bishop's see.

CHARTREUSE, or **CHARTREUSE-GRAND**, a celebrated monastery, the capital of all the convents of the Carthusian monks, situated on a steep rock in the middle of a large forest of fir-trees, about seven miles north-east of Grenoble, in the province of Dauphine in France: E. Long. 5. 5. N. Lat. 45. 20. See **CARTHUSIANS**.

From this mother-convent, all the others of the same order take their name; among which was the Chartreuse of London, corruptly called the charterhouse, now converted into an hospital, and endowed with a revenue of 600 l. *per ann.*

Here are maintained 80 decayed gentlemen, not under 50 years of age: also 40 boys are educated and fitted either for the university or trades. Those sent to the university, have an exhibition of 20 l. a-year for eight years; and have an immediate title to nine church-livings in the gift of the governors of the hospital, who are sixteen in number, all persons of the first distinction, and take their turns in the nomination of pensioners and scholars.

CHARYBDIS, a celebrated whirlpool in the straits of Messina between Italy and Sicily; much taken notice of by the ancient historians and poets, and de-

scribed by them in terms of the greatest horror. It is still dangerous, but not so formidable as in former ages; Mr Brydone only says, that "it often occasions such an intestine and irregular motion in the water, that the helm loses most of its power, and ships have the greatest difficulty to get into the harbour of Messina, even with the fairest wind that can blow." He conjectures that it is formed by the calciform promontory of the island of Sicily, which makes part of the harbour above mentioned, along with some other causes unknown.

CHARTULARY, **CHARTULARIUS**, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs. The chartulary presided in ecclesiastical judgments, in lieu of the pope. In the Greek church the chartulary was called *chartophylax*; but his office was there much more considerable; and some even distinguish the chartulary from the *chartophylax* in the Greek church. See **CHARTOPHYLAX**.

CHASE, or **CHACE**, in law, is used for a driving of cattle to or from any place; as to a distress, or forelet, &c.

CHASE, or **Chace**, is also a place of retreat for deer and wild beasts; of a middle kind between a forest and a park, being usually less than a forest, and not possessed of so many privileges; but wanting, *v. g.* courts of attachment, *swainmote*, and *justice-seat*. *See *Forest*. Yet it is of a large extent, and stocked both with a greater diversity of wild beasts or game, and more keeper than a park. Crompton observes, that a forest cannot be in the hands of a subject but it forthwith loses its name, and becomes a *chafe*; in regard all those courts lose their nature when they come into the hands of a subject; and that none but a king can make a lord chief justice in eyre of the forest. See **JUSTICE in Eyre**.

The following history of the English chases is given by Mr Pennant: "At first the beasts of chafe had this whole island for their range; they knew no other limits than the ocean, nor confessed any particular master. When the Saxons had established themselves in the heptarchy, they were reserved by each sovereign for his own particular diversion: hunting and war, in those uncivilized ages, were the only employ of the great; their active, but uncultivated minds, being susceptible of no pleasures but those of a violent kind, such as gave exercise to their bodies, and prevented the pain of thinking.

"But as the Saxon kings only appropriated those lands to the use of forests which were unoccupied, so no individuals received any injury: but when the conquest had settled the Norman line on the throne, this passion for the chase was carried to an excess, which involved every civil right in a general ruin: it superseded the consideration of religion even in the superstitious age: the village-communities, nay even the most sacred edifices, were turned into one vast waste, to make room for animals, the objects of a lawless tyrant's pleasure. The new forest in Hampshire is too true an instance to be dwelt on; sanguinary laws were enacted to preserve the game; and in the reigns of William Rufus, and Henry I. it was less criminal to destroy one of the human species than a beast of chafe. Thus it continued while the Norman line filled

Chartulary
l *Chafe*.

+ *Brit. Zool. i. 42.*

Chafe.

led the throne; but when the Saxon line was restored under Henry II. the rigour of the forest laws was immediately softened.

"When our barons began to form a power, they claimed a vault, but more limited tract for a diversion that the English were always fond of. They were very jealous of any encroachments on their respective bounds, which were often the cause of deadly feuds; such a one gave cause to the fatal day of *Chewy-chace*; a fact which, though recorded only in a ballad, may, from what we know of the manners of the times, be founded on truth: not that it was attended with all the circumstances which the author of that natural but heroic composition hath given it; for, on that day, neither a *Percy*, nor a *Douglas* fell: here the poet seems to have claimed his privilege, and mixed with this fray some of the events of the battle of *Otterbourne*.

"When property became happily more divided by the relaxation of the feudal tenures, these extensive hunting-grounds became more limited; and as tillage and husbandry increased, the beasts of chase were obliged to give way to others more useful to the community. The vast tracts of land, before dedicated to hunting, were then contracted; and, in proportion as the useful arts gained ground, either lost their original destination, or gave rise to the invention of parks. Liberty and the arts seem coeval; for when once the latter got footing, the former protected the labours of the industrious from being ruined by the licentious sportsman, or being devoured by the objects of his diversion: for this reason, the subjects of a despotic government still experience the inconveniences of vast wastes, and forests, the terrors of the neighbouring husbandmen; while in our well regulated monarchy very few chases remain. The English still indulge themselves in the pleasures of hunting; but confine the deer-kind to parks, of which England boasts of more than any other kingdom in Europe. The laws allow every man his pleasure; but confine them in such bounds as prevents them from being injurious to the meanness of the community. Before the Reformation, the prelates seem to have guarded sufficiently against this want of amusement, the see of Norwich, in particular, being possessed, about that time, of thirteen parks.

CHASE, in the sea-language, is to pursue a ship; which is also called *giving chase*.

Stern Chase, is when the chaser follows the chased astern directly upon the same point of the compass.

To lie with a Ship's fore-foot in a Chase, is to fall and meet with her by the nearest distance; and so to cross her in her way, or to come across her fore-foot.

A ship is said to have a *good chase*, when she is so built forward on, or a-stern, that she can carry many guns to shoot forwards or backwards; according to which she is said to have a *good forward*, or *good stern*, *chase*.

CHASE-Guns, are such whose ports are either in the head (and then they are used in chasing of others); or in the stern, which are only useful when they are pursued or chased by any other ship.

CHASE of a Gun, is the whole bore or length of a piece taken within-side.

Chafe

Chateau.

Wild-geese Chase, a term used to express a sort of racing on horseback used formerly, which resembled the flying of wild-geese; those birds generally going in a train one after another, not in confused flocks as other birds do. In this sort of race the two horses, after running twelve score yards, had liberty, which horse soever could take the leading, to ride what ground the jockey pleased, the hindmost horse being bound to follow him within a certain distance agreed on by the articles, or else to be whipped in by the tryers and judges who rode by; and whichever horse could distance the other, won the race. This sort of racing was not long in common use; for it was found inhuman, and destructive to good horses, when two such were matched together. For in this case neither was able to distance the other till they were both ready to sink under their riders; and often two very good horses were both spoiled, and the wagers forced to be drawn at last. The mischief of this sort of racing soon brought in the method now in use, of running only for a certain quantity of ground, and determining the plate or wager by the coming in first at the post.

CHASING of Gold, Silver, &c. See ENCHASING.

CHASTE-TREE. See VITEX.

CHASTITY; purity of the body, or freedom from obscenity.—The Roman law justifies homicide in defence of the chastity, either of one's self or relations; and so also, according to Selden, stood the law in the Jewish republic. Our law likewise justifies a woman for killing a man who attempts to ravish her. So the husband or father may justify killing a man who attempts a rape upon his wife or daughter; but not if he takes them in adultery by consent: for the one is forcible and felonious, but not the other. And without doubt the forcibly attempting a crime of a still more detestable nature, may be equally resisted by the death of the unnatural aggressor. For the one uniform principle that runs through our own and all other laws seems to be this, that where a crime in itself capital is endeavoured to be committed by force, it is lawful to repel that force by the death of the party attempting.

CHATEAU-BRIANT, a town of France in Brittany, with an old castle. W. Long. 1. 20. N. Lat. 47. 40.

CHATEAU-Chinon, a town of France in Nivernois, and capital of Morvant, with a considerable manufacture of cloth. E. Long. 3. 48. N. Lat. 47. 2.

CHATEAU-Dauphin, a very strong castle of Piedmont in Italy, and in the marquise of Saluces, belonging to the king of Sardinia. It was taken by the combined army of France and Spain in 1744, and was restored by the treaty of Aix-la-Chapelle.

CHATEAU-du-Loir, a town of France in the Maine, famous for sustaining a siege of seven years against the Count of Mans. It is seated on the river Loir, in E. Long. 0. 25. N. Lat. 47. 40.

CHATEAU-Dun, an ancient town of France, and capital of the Dunois, with a castle and rich monastery; seated on an eminence near the river Loir, in E. Long. 1. 26. N. Lat. 48. 4.

CHATEAU-Nenf, the name of several towns of France, viz. one in Perche; another in Angoumois, on the river Charente, near Angoulême; a third in Berry, seated

Chateau seated on the river Cher; and several other small places.
CHATEAU-Portien, a town of France, in Champagne, and in a district called Portien, with a castle built on a rock, near the river Aine. E. Long. 4. 23. N. Lat. 49. 35.

CHATEAU-Renaud, a town of France in the Gate-nois, where clothes are made for the army, and where there is a trade in saffron. E. Long. 2. 25. N. Lat. 48. 0. This is also the name of a town of Touraine, in France, with the title of a marquise. E. Long. 2. 41. N. Lat. 47. 22.

CHATEAU-Roux, a town of France, in Berry, with the title of a duchy. It has a cloth-manufacture, and is seated in a very large pleasant plain on the river Indre, in E. Long. 1. 47. N. Lat. 46. 49.

CHATEAU-Thierry, a town of France, in Champagne, with the title of a duchy, and a handsome castle on an eminence, seated on the river Maine, in E. Long. 3. 23. N. Lat. 49. 12.

CHATEAU-Vilain, a town of France, in Champagne, with a castle, and the title of a duchy; seated on the river Aujon. E. Long. 2. 59. N. Lat. 48. 0.

CHATEL, or **CHATE**, a town of Lorraine, in the Vosges, seated on the river Moselle, eight miles from Mirecourt.

CHATEL-Aillon, a maritime town of France, in Saintonge, five miles from Rochelle; formerly very considerable, but is now greatly decayed.

CHATEL-Chalon, a town of France, in Franche Comté, remarkable for its abbey of benedictine nuns. E. Long. 5. 25. N. Lat. 46. 50.

CHATELET, a town of the Netherlands, in Namur, seated on the Sambre, in the bishoprick of Liege. E. Long. 4. 28. N. Lat. 50. 25.

CHATELET, the name of certain courts of justice established in several cities in France. The grand chatelet at Paris, is the place where the presidial or ordinary court of justice of the provost of Paris is kept; consisting of a presidial, a civil chamber, a criminal chamber, and a chamber of policy. The little chatelet is an old fort, now serving as a prison.

CHATELLERAULT, a town of France, in Poitou, with the title of a duchy; seated in a fertile and pleasant country, on the river Vienne, over which there is a handsome stone-bridge. E. Long. 0. 40. N. Lat. 46. 34.

CHATHAM, a town of Kent, adjoining to Rochester, and seated on the river Medway. It is the principal station of the royal navy; and the yards and magazines are furnished with all sorts of naval stores, as well as materials for building and rigging the largest men of war. The entrance into the river Medway is defended by Sheerness and other forts; and, in the year 1757, by direction of the duke of Cumberland, several additional fortifications were begun at Chatham; so that now the ships are in no danger of an insult, either by land or water. It has a church; a chapel of ease; and a ship used as a church for the sailors: it has likewise about 500 houses, mostly low, and built with brick; the streets are narrow, and paved; and it contains about 3000 inhabitants. The principal employment of the labouring hands is ship-building in the king's yard, and private docks. E. Long. 0. 40. N. Lat. 51. 20.

CHATIGAN, a town of Asia, in the kingdom of Bengal, on the most easterly branch of the river Ganges. It is but a poor place, though it was the first the Portuguese settled at in these parts, and who still keep a sort of possession. It has but a few cotton manufactures; but affords the best timber for building of any place about it. The inhabitants are so suspicious of each other, that they always go armed with a sword, pistol, and blunderbuss, not excepting the priests. It is subject to the Great Mogul. E. Long. 91. 10. N. Lat. 23. 0.

CHATILLON-SUR-SEINE, a town of France, in Burgundy, divided into two by the river Seine. It is 32 miles from Langres, and 40 from Dijon; and has iron-works in its neighbourhood. E. Long. 4. 33. N. Lat. 47. 45.

CHATRE, a town of France, in Berry, seated on the river Indres, 37 miles from Bourges. It carries on a considerable trade in cattle. E. Long. 1. 55. N. Lat. 46. 35.

CHATELS, a Norman term, under which were anciently comprehended all moveable goods; those immoveable being termed *fiefs*, or *fee*.

CHATELS, in the modern sense of the word, are all sorts of goods, moveable or immoveable, except such as are in the nature of freehold.

CHATTERER, in ornithology. See **AMPELIS**.

CHAUCER (Sir Geoffrey), an eminent English poet in the 14th century, born at London in 1328. After he left the university he travelled into Holland, France, and other countries. Upon his return he entered himself in the Inner-temple, where he studied the municipal laws of England. His first station at court was page to Edward III. and he had a pension granted him by that prince till he could otherwise provide for him. Soon after we find him gentleman of the king's privy chamber; next year, shield-bearer to the king. Esteemed and honoured, he spent his younger days in a constant attendance at court, or for the most part living near it, in a square stone house near the Park-gate at Woodstock, still called Chaucer's house.

Soon after, having got the duke of Lancaster for his patron, Chaucer began every day to rise in greatness. In 1373 he was sent, with other persons, to the republic of Genoa to hire ships for the king's navy (our want of shipping in those times being usually supplied by such means); and the king was so well satisfied with his negotiation, that, on his return, he obtained a grant of a pitcher of wine daily in the port of London, to be delivered by the butler of England; and soon after was made comptroller of the customs for wool, wool-fells, and hides; an office which he discharged with great diligence and integrity. At this period, Chaucer's income was about L. 1000 a year; a sum which in those days might well enable him to live, as he says he did, with dignity in office, and hospitality among his friends. It was in this meridian blaze of prosperity, in perfect health of body and peace of mind, that he wrote his most humorous poems. His satires against the priests were probably written to oblige his patron the duke of Lancaster, who favoured the cause of Wickliff, and endeavoured to expose the clergy to the indignation of the people. In the last year of Edward III. our poet was employed in

Chatigan
 Chaucer.

Chaucer.

in a commission to treat with the French; and in the beginning of king Richard's reign, he was in some degree of favour at court.

The duke of Lancaster at last finding his views checked, began to abandon Wickliffe's party: upon which, Chaucer likewise, how much soever he had espoused that divine's opinions, thought it prudent to conceal them more than he had done. With the duke's interest that of Chaucer entirely sunk; and the former passing over sea, his friends felt all the malice of the opposite party. These misfortunes occasioned his writing that excellent treatise *The Testament of Love*, in imitation of Boethius on the consolation of philosophy. Being much reduced, he retired to Woodstock, to comfort himself with study, which produced his admirable treatise of the *Affrolabe*.

The duke of Lancaster at last surmounting his troubles, married lady Catharine Swynford, sister to Chaucer's wife; so that Thomas Chaucer, our poet's son, became allied to most of the nobility, and to several of the kings of England. Now the fun began to shine upon Chaucer with an evening ray; for by the influence of the duke's marriage, he again grew to a considerable share of wealth. But being now 70, he retired to Dunnington-castle near Newbury. He had not enjoyed this retirement long before Henry IV. son of the duke of Lancaster, assumed the crown, and in the first year of his reign gave our poet marks of his favour. But however pleasing the change of affairs might be to him at first, he afterwards found no small inconveniences from it. The measures and grants of the late king were annulled; and Chaucer, in order to procure fresh grants of his pensions, left his retirement, and applied to court: where, though he gained a confirmation of some grants, yet the fatigue of attendance, and his great age, prevented him from enjoying them. He fell sick at London; and ended his days in the 72d year of his age, leaving the world as though he despised it, as appears from his song of *Flie from the Fesle*. The year before his death he had the happiness, if at his time of life it might be so called, to see the son of his brother-in-law (Hen. IV.) seated on the throne. He was interred in Westminster abbey; and in 1556, Mr Nicholas Bingham, a gentleman of Oxford, at his own charge, erected a handsome monument for him there. Caxton first printed the Canterbury tales; but his works were first collected, and published in one volume folio, by William Thynne, London, 1542. They were afterwards reprinted in 1561, 1598, 1602. Oxford, 1721.

Chaucer was not only the first, but one of the best poets which these kingdoms ever produced. He was equally great in every species of poetry which he attempted; and his poems in general possess every kind of excellence, even to a modern reader, except melody and accuracy of measure; defects which are to be attributed to the imperfect state of our language, and the infancy of the art in this kingdom at the time when he wrote. "As he is the father of English poetry, (says Mr Dryden,) so I hold him in the same degree of veneration as the Grecians held Homer, or the Romans Virgil; he is a perpetual fountain of good sense, learned in all sciences, and therefore speaks properly on all subjects: as he knew what to say, so he knows also when

to leave off; a continence which is practised by few writers; and scarcely by any of the ancients, except Virgil and Horace." This character Chaucer certainly deserved. He had read a great deal; and was a man of the world, and of sound judgement. He was the first English poet who wrote *poetically*, as Dr Johnson observes in the preface to his dictionary, and (he might have added) who wrote like a gentleman. He had also the merit of improving our language considerably, by the introduction and naturalization of words from the *Provençal*, at that time the most polished dialect in Europe.

CHAUD-MEDLEY, in law, is of much the same import with CHANCE-Medley. The former in its etymology signifies an affray in the heat of blood or passion; the latter, a casual affray. The latter is in common speech too often erroneously applied to any manner of homicide by misadventure; whereas it appears by the stat. 24 Hen. VIII. c. 5. and ancient books (Staundf. P. C. 16.) that it is properly applied to such killing as happens in self-defence, upon sudden encounter.

CHAUL, a town of the East Indies, on the coast of Malabar, in the province of Bagan, and kingdom of Vilapour. Its river affords a good harbour for small vessels. The town is fortified, and so is the island on the south side of the harbour. It had formerly a good trade, but is now miserably poor. It was taken by the Portuguese in 1507, to whom it still belongs. It is fifteen miles south of Bombay, and five miles from the sea. E. Long. 72. 45. N. Lat. 18. 30.

CHAULIEU (William Amfisey de), abbé d'Amale, one of the most polite and ingenious of the French poets, was born in 1629; and died at the age of 84. The most complete edition of his poems is that printed in 2 vols 8vo, in 1733.

CHAUMONT, a town of France, in Champagne, and in the district of Bassigny, of which it is the capital. It is seated on a mountain near the river Marne. E. Long. 5. 15. N. Lat. 48. 6.

CHAUNE, a town of France, in Picardy, and in the district of Santerre, with the title of a duchy. E. Long. 2. 55. N. Lat. 49. 45.

CHAUNY, a town of France, in Picardy, seated on the river Oise, in Chantry. E. Long. 3. 17. N. Lat. 49. 37.

CHAUVIN (Stephen), a celebrated minister of the reformed religion, born at Nismes, left France at the revocation of the edict of Nantz, and retired to Rotterdam, where he began a new *Journal des Savans*; and afterwards removing to Berlin, continued it there three years. At this last place, he was made professor of philosophy, and discharged that office with much honour and reputation. His principal work is a philosophical dictionary, in Latin, which he published at Rotterdam in 1692: and gave a new edition of it much augmented, at Lewarden, in 1713, folio. He died in 1725, aged 85.

CHAVEZ, a strong town of Tralos-Montes in Portugal, is seated at the foot of a mountain on the river Tamega. It has two suburbs, and as many forts; one of which looks like a citadel. Between the town and suburb of Magdalena, is an old Roman stone-bridge above 92 geometrical paces long. W. Long. 7. 1. N. Lat. 41. 45.

Chaud-medley

Chavez.

Chazin-
arians.
↓
Chazelles

CHAZINZARIANS, a sect of heretics, who rose in Armenia in the seventh century. The word is formed of the Armenian, *chazur*, "cross." They are also called *staurolatæ*, which, in Greek, signifies the same as *chazinarians* in Armenian, *viz.* *adversers of the cross*; they being charged with paying adoration to the cross alone. In other respects they were Nestorians; and admitted two persons in Jesus Christ. Nicephorus ascribes other singularities to them; particularly their holding an annual feast, in memory of the dog of their false prophet Sergius which they called *artizbartzes*.

CHAZELLES (John Matthew), a celebrated French mathematician and engineer, was born at Lyons in 1657. M. du Hamel, with whom he got acquainted, finding his genius incline towards astronomy, presented him to M. Cassini, who employed him in his observatory. In 1684, the duke of Mortemar made use of Chazelles, to teach him mathematics; and, the year after, procured him the preferment of hydrography professor for the galleys of Marleilles, where he set up a school for young pilots designed to serve aboard the galleys. In 1686, the galleys made four little campaigns, or rather four courses, purely for exercise. Chazelles went on board every time with them; kept his school upon the sea, and shewed the practice of what he taught. In the years 1687 and 1688, he made two other sea-campaigns, in which he drew a great many plans of ports, roads, towns, and forts, which were lodged with the ministers of state. At the beginning of the war, which ended with the peace of Ryfwick, some marine officers, and Chazelles among the rest, fancied the galleys might be so contrived as to live upon the ocean; that they might serve to tow the men of war when the wind failed or proved contrary, and also help to secure the coast of France upon the ocean. Chazelles was sent to the west coasts in July 1689, to examine the practicableness of this scheme; and in 1690, fifteen galleys new built set sail from Rochefort, and cruised as far as Torbay in England, and proved serviceable at the descent upon Tinmouth. After this, he digested into order, the observations he had made on the coasts of the ocean; and drew distinct maps with a portulan to them, *viz.* a large description of every haven, of the depth, the tides, the dangers and advantages discovered, &c. These maps were inserted in the *Neptune Francoise*, published in 1692, in which year Chazelles was engineer at the descent at Oneille. In 1693, Monsieur de Pontchartrain, then secretary of state for the marine, and afterwards chancellor of France, resolved to get the *Neptune Francoise* carried on to a second volume, which was also to take in the Mediterranean. Chazelles desired that he might have a year's voyage on this sea, for making astronomical observations; and, the request being granted, he passed by Greece, Egypt, and the other parts of Turkey, with his quadrant and telescope in his hand. When he was in Egypt he measured the pyramids; and finding the sides of the largest precisely facing the four cardinal points, naturally concluded this position to have been intended, and also that the poles of the earth and meridians had not since deviated. Chazelles likewise made a report of his voyage in the Levant, and

Vol. III.

gave the academy all the satisfaction they wanted concerning the position of Alexandria: upon which he was made a member of the academy in 1695. He died in 1710.

CHEASAPEAKE BAY, in North America, the entrance between Cape Henry and Cape Charles, running up 30 miles between Virginia and Maryland. It is navigable almost all the way for large ships, and has several navigable rivers that fall into it, by means of which, ships go up to the very doors of the planters, to take in their lading of goods.

CHEATS, are deceitful practices in defrauding, or endeavouring to defraud, another of his known right, by means of some artful device, contrary to the plain rules of common honesty; as by playing with false dice, or by causing an illiterate person to execute a deed to his prejudice, by reading it over to him in words different from those in which it was written, &c.—If any person deceitfully get into his hands or possession, any money or other things of any other person's by colour of any false token, &c. being convicted, he shall have such punishment by imprisonment, setting upon the pillory, or by any corporeal pain except pains of death, as shall be adjudged by the persons before whom he shall be convicted.—As there are frauds which may be relieved civilly, and not punished criminally; so there are other frauds, which in a special case may not be helped civilly, and yet shall be punished criminally. Thus if a minor goes about the town, and pretending to be of age, defrauds many persons by taking credit for a considerable quantity of goods, and then insisting on his nonage, the persons injured cannot recover the value of their goods, but they may indict and punish him for a common cheat. Persons convicted of obtaining money or goods by false pretences, or of sending threatening letters in order to extort money or goods, may be punished with fine or imprisonment, or by pillory, whipping, or transportation.

CHEBRECHIN, a town of Poland, in the province of Russia and palatinate of Belkrow. It is seated on the declivity of a hill, and the river Wierpi waters its walls, and afterwards falls into the river Bog. The Jews there are very rich. E. Long. 23. 51. N. Lat. 50. 35.

CHECAYA, in Turkish affairs, the second officer of the Janizaries, who commands them under the aga, and is otherwise called *protogero*.

There is also a *checaya* of the treasury, stables, kitchen, &c. the word signifying as much as lieutenant, or the second in any office.

CHECK, or **CHECK-ROLL**, a roll or book, wherein are contained the names of such persons as are attendants and in the pay of the king, or other great personages, as their household servants.

Clerk of the CHECK, in the king's household, has the check and controulment of the yeomen of the guard, and all the uihers belonging to the royal family, allowing their absence or defects in attendance, or diminishing their wages for the same, &c. He also, by himself or deputy, takes the view of those that are to watch in the court, and has the setting of the watch, &c.

Clerk of the CHECK in the royal dock-yards, an officer who keeps a muster or register of all the men

thus.

employed aboard his majesty's ships and vessels, and also of all the artificers and others in the service of the navy at the port where he is settled.

CHECK, in falconry, a term used of a hawk, when the forlakes her proper game, to fly at pyes, crows, rooks, or the like, that crows her in her flight.

CHECKY, in heraldry, is when the shield, or a bordure, &c. is chequered, or divided into chequers or squares, in the manner of a chess-board.

This is one of the most noble and most ancient figures used in armoury; and a certain author saith, that it ought to be given to none but great warriors, in token of their bravery; for the chess-board represents a field of battle; and the pawns placed on both sides represent the soldiers of the two armies, which move, attack, advance, or retire, according to the will of the gamesters who are the generals.

This figure is always composed of metal and colour. But some authors would have it reckoned among the several sorts of furs.

CHEEK, in anatomy, that part of the face situated below the eyes on each side.

CHEEKS, a general name among mechanics, for almost all those pieces of their machines and instruments, that are double, and perfectly alike. Thus,

The *Cheeks of a Printing-press*, are its two principal pieces: they are placed perpendicular, and parallel to each other; serving to sustain the three sommers, *viz.* the head, shelves, and winter, which bear the spindle, and other parts of the machine. See **PRINTING-Press**.

CHEESE, a sort of food prepared of curdled milk purged from the serum or whey, and afterwards dried for use.

Cheese differs in quality according as it is made from new or skimmed milk, from the curd which separates spontaneously upon standing, or that which is more speedily produced by the addition of rennet. Cream also affords a kind of cheese, but quite fat and butyraceous, and which does not keep long. Analyzed chemically, cheese appears to partake much more of an animal nature than butter, or the milk from which it was made. It is infusible in every liquid except spirit of nitre, and caustic alkaline ley. Shaved thin, and properly treated with hot water, it forms a very strong cement if mixed with quicklime*. When prepared with the hot water, it is recommended in the Swedish memoirs to be used by anglers as a bait. It may be made into any form, is not softened by the cold water, and the fishes are fond of it.—As a food, physicians condemn the too free use of cheese. When new, it is extremely difficult of digestion: when old, it becomes acid and hot; and, from Dr Percival's experiments, is evidently of a septic nature. It is a common opinion, that old cheese digests every thing, yet is left undigested itself; but this is without any solid foundation.—Cheese made from the milk of sheep digests sooner than that from the milk of cows, but is less nourishing; that from the milk of goats digests sooner than either, but is also the least nourishing. In general, it is a kind of food fit only for the laborious, or those whose organs of digestion are strong.

Every country has places noted for this commodity:

thus Chester and Gloucester cheese are famous in England; and the Parmesan cheese is in no less repute abroad, especially in France. This sort of cheese is entirely made of sweet cow-milk: but at Rochefort in Languedoc, they make it of ewe's milk; and in other places it is usual to add goat or ewe's milk in a certain proportion to that of the cow. There is likewise a kind of medicated cheese made by intimately mixing the expressed juice of certain herbs, as sage, baum, mint, &c. with the curd before it is fashioned into a cheese.—The Laplanders make a sort of cheese of the milk of their rein-deer; which is not only of great service to them as food, but on many other occasions. It is a very common thing in these climates to have a limb numbed and frozen with the cold; their remedy for this is the heating an iron red hot, and thrusting it through the middle of one of these cheeses; they catch what drops out, and with this anoint the limb, which soon recovers it. They are subject also to coughs and diseases of the lungs, and these they cure by the same sort of medicine: they boil a large quantity of the cheese in the fresh deer's milk, and drink the decoction in large draughts warm several times a day. They make a less strong decoction of the same kind also, which they use as their common drink, for three or four days together, at several times of the year. They do this to prevent the mischiefs they are liable to from their water, which is otherwise their constant drink, and is not good.

The hundred weight of cheese pays on importation 1s. 3½ d. and draws back on exportation 1s. 1½ d. at the rate of 6s. 8d. The cheese of Ireland is prohibited to be imported.

CHEESE-Rennet. See **GALLIUM**.

CHEIRANTHUS, STOCK-GILLIFLOWER, or *Wall-flower*; a genus of the filiquosa order, belonging to the tetradynamia class of plants. The species are 13, but the following three are most worthy of notice. 1. The cheiri or common wall-flower, with ligneous, long, tough roots; an upright, woody, abiding stalk, divided into many erect angular branches, forming a bushy head from one to two feet high, closely garnished with spear-shaped, acute, smooth leaves, and all the branches terminating in long erect spikes of numerous flowers, which in different varieties are yellow, bloody, white, &c. 2. The incanus, or hoary cheiranthus, with ligneous, long, naked, white roots; and upright, strong, woody, abiding stem, from one to three feet high, branchy at top, adorned with long, spear-shaped, obtuse, hoary leaves; and the top of the stalk and all the branches terminated by erect spikes of flowers from one to two or three feet long, of different colours in different varieties. 3. The annuus, or ten-weeks-stock, with an upright, woody, smooth stalk, divided into a branchy head, 12 or 15 inches high, garnished with spear-shaped, blunt, hoary leaves, a little indented, and all the branches terminated by long erect spikes of numerous flowers of different colours in different varieties.—The two first sorts are very hardy evergreen biennials or perennials; but the last is an annual plant, so must be continued by seed sown every year; and even the two first, notwithstanding their being perennial, degenerate so much in their flowers after the first year, that it will be proper also to raise an annual

* See *Griment*.

Chekao
Cheke.

annual supply of them. The seeds are to be sowed only from the plants with single flowers; for the double ones bring no seeds to perfection. The seeds are to be chosen from such flowers as have five, six, or more petals, or from such as grow near to the double ones. They may be sown in the full ground in the spring, and may be afterwards transplanted. When fine doubles of the two first kinds are obtained, they may be multiplied by slips from the old plants.

CHEKAO, in natural history, the name of an earth found in many parts of the East Indies, and sometimes used by the Chinese in their porcelain manufactures. It is a hard and stony earth; and the manner of using it is this: they first calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water: then stirring the whole together, they let the coarser part subside; and pouring off the rest yet thick as cream, they leave it to settle, and use the matter which is found at the bottom in form of a soft paste, and will retain that humidity a long time. This supplies the place of the earth called *boache*, in the making of that elegant sort of china-ware which is all white, and has flowers which seem formed by a mere vapour within its surface. The manner of their using it is this: they first make the vessel of the common matter of the manufacture; when this is almost dry, they paint upon it the flowers, or whatever other figures they please, with a pencil dipped in this preparation of the chekao; when this is thoroughly dry, they cover the whole vessel with the varnish in the common way, and bake it as usual. The consequence is, that the whole is white: but the body of the vessel, the figures, and the varnish, being three different substances, each has its own particular white; and the flowers being painted in the finest white of all, are distinctly seen through the varnish upon the vessel, and seem as if traced by a vapour only. The *hoache* does this as well as the chekao; and has besides this the quality of serving for making the porcelain ware either alone, or in the place of kaolin: the chekao has not this property, nor any other substance besides this *hoache*, which appears to be the same with our steatites or soap-rock.

CHEKE (Sir John), a celebrated statesman, grammarian, and divine, of an ancient family in the Isle of Wight, was born at Cambridge in the year 1514, and educated at St John's college in that university; where, after taking his degrees in arts, he was first chosen Greek lecturer, and in 1540 professor of that language, with a stipend of 40 l. a-year. In this station he was principally instrumental in reforming the pronunciation of the Greek language, which, having been much neglected, was imperfectly understood. About the year 1543 he was incorporated master of arts at Oxford, where, we are told, he had studied for some time. In the following year he was sent to the court of king Henry VIII. and appointed tutor for the Latin language, jointly with Sir Anthony Cooke, to prince Edward, about which time he was made canon of the college newly founded in Oxford; wherefore he must have now been in orders. On the accession of his royal pupil to the crown, Mr Cheke was first rewarded with a pension of 100 marks, and afterwards obtained several considerable grants from the crown. In

Che-kyang
Cheke.

1550 he was made chief gentleman of the privy-chamber, and was knighted the following year; in 1552, chamberlain of the exchequer for life; in 1553, clerk of the council; and soon after secretary of state and privy-counsellor. But these honours were of short duration. Having concurred in the measures of the duke of Northumberland for setting the crown on the unfortunate Jane Grey, and acted as her secretary during the nine days of her reign, on the accession of queen Mary, Sir John Cheke was sent to the tower, and stripped of the greatest part of his possessions. In September 1554 he obtained his liberty, and a licence from her majesty to travel abroad. He went first to Basil, thence to Italy, and afterwards returned to Strasburg, where he was reduced to the necessity of reading Greek lectures for subsistence. In 1556 he set out in an evil hour to meet his wife at Brussels; but, before he reached that city, he was seized by order of king Philip II. woodwinded, and thrown into a waggon; and thus ignominiously conducted to a ship, which brought him to the tower of London. He soon found that religion was the cause of his imprisonment; for he was immediately visited by two Romish priests, who piously endeavoured to convert him, but without success. However, he was at last visited by Fleckenham; who told him from the queen, that he must either comply or burn. This powerful argument had the desired effect; and Sir John Cheke accordingly complied in form, and his lands, upon certain conditions, were restored: but his remorse soon put an end to his life. He died in September 1557, at the house of his friend Mr Peter Osborne in Woodstreet, London, and was buried in St Alban's church. He left three sons, the eldest of which, Henry, was knighted by queen Elizabeth. He wrote 1. A Latin translation of two of St Chrysostom's homilies. Lond. 1543, 4to. 2. The Hurt of Sedition. Lond. 1549, 1576, 1641. 3. Latin translation of the English communion service. Printed among Bucer's opuscula. 4. De pronunciatione Græcæ. Basil, 1555, 8vo. 5. Several letters published in his life by Strype; and a great number of other books.

CHE-KYANG, or TSEKIAN, a province of the empire of China, formerly the residence of the Chinese monarchs, and one of the most considerable in the whole empire. It is bounded on the south by Fo-kyen; on the north and west, by Kyang-nan, and Kyang-si; and on the east by the sea. It extends itself from the 27th to the 31st degree of North Latitude, and from 116° to almost 120° of East Longitude, according to the meridian of Paris. The climate of it is serene and healthy, and the inhabitants very numerous, amounting, according to their registers, to 4,525,700 men. The country is exceedingly rich and fertile, beautifully variegated with well cultivated mountains, fruitful valleys and plains; so that there is not a spot which is not turned to the best advantage. It is intersected by a multitude of rivers and canals; the last cut wide and deep, and lined on both sides with hewn stone. The plains on both sides have a communication with each other by a vast number of bridges, so that one may travel through the whole province either by land or water. A vast quantity of silk is manufactured in this province; which is here finer, more rich and

Chelmise.

curiously wrought with gold and silver, than in any other; and yet is so cheap, that a good silk suit will cost less than one of the most ordinary cloth in Europe. The tribute of silk paid to the emperor is said to amount to 370,466 pounds raw, and 2574 wrought, besides some other quantities of the finest, sent as a present to the court by the imperial barges. The province hath eleven capital cities, or cities of the first rank, and 77 of the second and third rank; besides 18 fortresses, most of them upon the sea-coasts, and large and populous enough to pass in other countries for considerable cities. The inhabitants are ingenious, polite, and courteous to strangers, but very superstitious.

CHELIDONIUM, CELANDINE, and HORNED or PRICKLY POPPY, a genus of the monogynia order, belonging to the polyandria class of plants. There are six species, none of which are remarkable for their beauty; but one of them, *viz.* the majus, is an article in the materia medica. It grows on old walls, among rubbish, and in waste shady places. The herb is of a bluish green colour; the root of a deep red; and both contain a gold-coloured juice: their smell is disagreeable, the taste somewhat bitterish, very acrid, burning and biting the mouth; the root is the most acrid. The juice takes off warts; cures tetters, ring-worms, and the itch; and, diluted with milk, it consumes opaque white spots on the eye.—Horses, cows, goats, and swine, refuse to eat the herb.

CHELIDONIUS LAPIS, in natural history, a stone said by the ancients to be found in the stomachs of young swallows, and greatly cried up for its virtues in the falling-sickness; but, from their description, it appears to be only a species of lycodonte, or bufonite. See **LYCODONTES**, and **BUFONITE**.

CHELM, a town of Poland, capital of a palatinate of the same name. It is situated in the province of

Red Russia. E. Long. 23. 30. N. Lat. 51. 25.

CHELMSFORD, the county town of Essex, situated on the river Chelmer, in E. Long. 30. N. Lat. 51. 40. It sends two members to parliament.

CHELONE, in botany, a genus of the angiosperma order, belonging to the didymia class of plants. There are three species, *viz.* the Glabra, the Hirsuta, and the Penilemon. They are natives of North America; and are herbaceous flowery perennials, with upright stalks two feet high, decorated with spear-shaped leaves, and beautiful spikes of monopetalous, ringent flowers, red, rose-coloured, blue, and purple. They flower from September to November, and are sometimes succeeded by ripe seeds in this country. They are very hardy plants, and may be propagated by seeds sown in any soil or situation; but the two first multiply so fast by their creeping roots, that the seeds are seldom regarded.

CHELSEA, a fine village situated on the northern bank of the river Thames, a mile westward of Westminster, remarkable for a magnificent hospital of invalids and old decrepit soldiers; and a pleasure-house, called Ranelagh, to which a great deal of fine company resort in summer.

CHELTENHAM, or CHILTENHAM, a market-town of Gloucestershire, seven miles north-east of Gloucester. W. Long. 2. 10. N. Lat. 51. 50. It is chiefly remarkable for its mineral waters, of the same kind with those of Scarborough. See **SCARBOROUGH**.

CHEMISE, in fortification, the wall with which a bastion, or any other bulwark of earth, is lined for its greater support and strength: or it is the solidity of the wall from the talus to the stone-roy.

Fire-CHEMISE, a piece of linen cloth, steeped in a composition of oil of petrol, camphor, and other combustible matters, used at sea, to set fire to an enemy's vessel.

C H E M I S T R Y

¹ Definition. **MAY** be defined, The study of such phenomena or properties of bodies as are discovered by variously mixing them together, and by exposing them to different degrees of heat, alone, or in mixture, with a view to the enlargement of our knowledge in nature, and to the improvement of the useful arts: or, It is the study of the effects of heat and mixture upon all bodies, whether natural or artificial, with a view to the improvement of arts and natural knowledge.

² Antiquity. The science of chemistry is undoubtedly of very high antiquity; and, like most other sciences, its origin cannot be traced. In scripture, Tubal Cain, the 8th from Adam, is mentioned as the father or instructor of every artificer in brass or iron. This, however, does not constitute him a chemist, any more than a founder or blacksmith among us has a right to that title. The name of chemist could only belong to him, whoever he was, who first discovered the method of extracting metals from their ores; and this person must necessarily have lived before Tubal Cain, as every blacksmith or founder must have metals ready pre-

pared to their hand. Nevertheless, as Tubal Cain lived before the flood, and the science of chemistry must have existed before his time, some have conjectured, that the metallurgic part of chemistry, on account of its extreme usefulness to mankind, was revealed to Adam by God himself.

Be this as it will, *Siphoas*, an Egyptian, is considered by the chemists as the founder of their science. He was known by the Greeks under the name of *Hermes*, or *Mercurius Trismegistus*; and is supposed to have lived more than 1900 years before the Christian era. A numerous list of this philosopher's works is given by Clemens Alexandrinus; but none of them are now to be found, nor do any of them appear to have been written professedly on chemistry.

Two illustrious Egyptians, of the name of *Hermes*, are recorded by ancient authors. The elder supposed to be the same with *Mizraim*, the grandson of Noah, the *Hermes* of the Greeks, and *Mercury* of the Romans. The younger *Hermes* lived a thousand years afterwards, and is supposed to have restored the sciences after they had fallen into oblivion, in consequence

³ Science founded.

quence of an inundation of the Nile. No less than 36,000 books are said to have been written under the name of Hermes; but, according to Jamblichus, a custom prevailed of inscribing all books of science with the name of Hermes. Some authors deny the existence of Hermes, and maintain that his history is allegorical.

4
Moses sup-
posed to be
skilled in
chemistry.

As the science of chemistry is supposed to have been well known to the Egyptians, Moses, who was skilled in their wisdom, is thence ranked among the number of chemists; a proof of whose skill in this science is thought to be, his dissolving the golden calf made by the Israelites, so as to render it potable.

Of all the Greeks who travelled into Egypt, in order to acquire knowledge, Democritus alone was admitted into their mysteries. The Egyptian priests are said to have taught him many chemical operations; among which were the art of softening ivory, of vitrifying flints, and of imitating precious stones.

Very little, however, can be gathered from any of the more ancient authors concerning the progress of this science; but as there is no instance of any nation in the world which was totally destitute of metals, we are assured that the metallurgic part of chemistry must have been known to some persons in every age, and every nation; nor have we the least reason to imagine that the knowledge of metallurgy, in these early ages, was at all inferior to what it is at present. In the sacred writings, allusions are very frequently made by the prophets to the methods of refining silver, and particularly to the blowing of bellows upon the surface of it, in order to drive off the baser metals scorified, and reduced to a calx by the violent action of the heat. By the manner in which these things are spoken, it would seem that the knowledge of them was pretty general, as much indeed as it is just now.

5
Alchemy.

In the fourth and fifth centuries, some of the Greek writers speak of an art, as then generally known, of transmuting the baser metals into gold; and, in the end of the 13th century, when the learning of the eastern countries was brought into Europe by the Arabians, the pretensions to a knowledge of transmutation of metals began likewise to spread into this quarter of the world. The art itself, called *Alchemy*, is supposed to have been of Egyptian original; and it is probable, that when the ancient Greek philosophers travelled into Egypt, they brought back some of the allegorical language of the Egyptian art ill understood, which afterwards passed into their mythology.

The science of alchemy seems to have been the earliest branch of philosophic chemistry, as being originally speculative; whereas, in all other parts of chemical knowledge, facts seem to have preceded reasoning. Success in alchemy was thought impossible, without a previous knowledge of the nature, essence, and principles of metals; whence they are produced in the mines, whence they received their increase, &c.

The general principles of metals were supposed to have been two, *viz.* mercury and sulphur; of both which, particularly of the latter, there were different kinds. In gold it was pure, red, fixed, and incombustible; but of different qualities in the other metals. The principles of gold they imagined to be scattered

in certain other bodies; and these they laboured to collect and unite, in order to the composition of the precious metal. The alchemists did not stop here; they pretended to a product of a higher order, called the *elixir*, the *medicine for metals*, the *tincture*, the *philosopher's stone*; which by being projected on a large quantity of any of the inferior metals in fusion, should change them into pure gold; being laid upon a plate of silver, copper, or iron, and moderately heated, should change into gold all the places to which it was applied; and on being properly treated with pure gold, should change it into a powder of the same virtue and efficacy with itself; and which, by continued coction, should have its virtue more and more exalted, so as at last to be able to change into pure gold 272,330 parts of base metal.

Pretensions of this kind carry along with them such an air of absurdity, that it is not at present worth while to say any thing further concerning them, than that they have at last fallen into universal discredit, though not sooner than the last century.

In the sixteenth century, chemistry was first introduced into physic by Paracelsus, who added a new species of folly to that of his predecessors. This was an imagination, that by alchemy an universal medicine might be discovered, by which the human life could be prolonged to any length of time whatever. But, though Paracelsus, and his disciple Van Helmont, both pretended to have been in possession of this remedy, the one died at the age of 48, and the other at that of 63 years.

This notion of an universal remedy, absurd as it was, found many partisans; and the books of the chemists were now filled with receipts for making potable gold, elixirs of life, panaceas, &c. but written in unintelligible language.

Happily the taste for knowledge, which at last began to succeed the jargon and ignorance of preceding ages, awakened men to inquiries concerning the most important and essential operations of chemistry.

Agricola is one of the first and best authors on the subject of metallurgy. Being born in a village in Misnia, a country abounding in mines and metallurgic works, he described them exactly and copiously. He was a physician, and cotemporary with Paracelsus, but of a character very different. His writings are clear and instructive, as those of Paracelsus are obscure and useless. Lazard, Erker, Schinder, Schlutter, Henkel, &c. have all written on metallurgy, and described the art of assaying metals. Anthony Nevi, Dr Merret, and the famous Kunkel, (who discovered the phosphorus of urine) have described very fully the arts of making glass, enamels, imitations of precious stones, &c.; but their writings, as well as those of succeeding chemists, are not free from the illusions of alchemy; so true it is, that an obstinate and inveterate malady never disappears at once, without leaving traces behind. Soon after, however, the alchemical phrenzy was attacked by many powerful antagonists, who contributed to rescue the science of chemistry from an evil which at once disgraced it, and retarded its progress. Among these, the most distinguished are Kircher a Jesuit, and Conningins a physician, who wrote with much success and reputation.

6
Chemistry introduced into medicine, and an universal remedy imagined.

7
Chemistry emerges from its obscurity.

About the middle of the last age, several of the parts of chemistry began to be collected, examined, and compared, with a view to discover their principles, and observe their relations, so as to unite them into one body of rational doctrine. This, which we may consider as the foundation of chemistry, considered as a science, was first begun by *James Barner*, physician to the king of Poland, who arranged into order the principal chemical experiments, and added rational explanations. His work is intitled *Philosophical Chemistry*. The phenomena of this science are there referred to the system of alkalis and acids, established by Tachenius, but abused by being too far extended. A valuable treatise on chemistry was also published by Bohnius, professor at Leipzig; and Becher, principal physician to the electors of Mentz and Bavaria, has

laid down the most satisfactory theory ever published; and which has been adopted by almost all succeeding philosophical chemists, particularly Stahl, who has shewn it to be the most enlightening, and the most conformable to the phenomena of chemistry of any thing of the kind ever published.

From this time the science of chemistry has advanced prodigiously. A true theory, arising from experiments already made, has led to numberless new ones; and the labours of the learned Boerhaave, Boyle, Newton, &c. have contributed to lay a foundation for the improvements made by the celebrated chemists of the present time, from whose new discoveries it is to be hoped, that the science will still continue to advance, many useful arts to be improved, and the operations of nature to be more and more understood.

PART I. THEORY OF CHEMISTRY.

8
Perfect
Theory,
what.

ACCORDING to the definition we have given of this science, the theory of it ought to consist in a thorough knowledge of all the phenomena which result from every possible combination of its objects with one another, or from expelling them in all possible ways to those substances which chemists have found to be the most active in producing a change. So various, however, and so widely extended are the objects of chemistry, (comprehending all terrestrial bodies whatever), that a knowledge of this kind is utterly unattainable by man. The utmost that can be done in this case is, to give some account of the phenomena which accompany the mixtures of particular substances, or the appearances they put on when exposed to heat, which have been already so well ascertained that they may now be laid down as rules, whereby we may, with a good deal of certainty, judge of the event of our experiments, even before they are made.

9
Objects of
Chemistry,
what.

Here we must observe, that though the objects of chemistry are as various as there are different substances in the whole system of nature, yet they cannot all be examined with equal ease. Some of these substances act upon others with great violence; and the greater their activity, the more difficultly are they themselves subjected to a chemical examination. Thus, fire, which is the most active body in nature, is so little the subject of examination, that it hath hitherto baffled the ingenuity of the greatest philosophers to understand its composition; (see FIRE.) This substance therefore, though it be the principal, if not the only agent in chemistry, is not properly an object of it, because it cannot be made a subject of any chemical operation.

10
Supposition
of elements
the origin
of alchemy.

It hath been customary to consider all bodies as composed of certain permanent and unchangeable parts, called elements; and that the end of chemistry was to resolve bodies into these elements, and to re-compose them again by a proper mixture of the elements when so separated. Upon this supposition the alchemists went; who, supposing that all bodies were composed of salt, sulphur, and mercury, endeavoured to find out the proportions in which these existed in gold, and then to form that metal by combining them in a similar manner. Had they taken care to ascertain the real existence of their elements, and, by mixing them together, composed any one body whatever;

though but a grain of lead, the least valuable of all metals, their pretensions would have been very rational and well founded; but as they never ascertained the existence of such elementary bodies, it is no wonder that their labours were never attended with success.

11
Mr Boyle's
opinion.

Another set of elements which were as generally received, and indeed continue to be so in some measure to this day, are fire, air, earth, and water.—This doctrine of elements was strenuously opposed by Mr Boyle; who endeavoured to prove, that fire was not an element *per se*, but generated merely from the motion of the particles of terrestrial bodies among one another, (see FIRE); that air was produced from the substance of most solid bodies; and that water, by a great number of distillations; was converted into earth. His arguments, however, concerning fire were not at all conclusive; nor does the expulsion of air from fixed bodies prove that any of their solid parts were employed in the composition of that air, as later discoveries have shewn that air may be absorbed from the external atmosphere, and fixed in a great number of solid substances. His assertion concerning water deserves much consideration, and the experiment is well worth repeating; but it does not appear that he, or any other person, ought to have relied upon the experiment which was intended to prove this transmutation. The fact was this. Having designed to try the possibility of reducing water to earth by repeated distillations, he distilled an ounce of water three times over himself, and found a small quantity of earth always remaining. He then gave it to another, who distilled it 197 times. The amount of earth from the whole distillations was six drachms, or $\frac{1}{2}$ of the quantity of water employed; and this earth was fixed, white, and insoluble in water.—Here it is evident, that great suspicions must lie against the fidelity of the unknown operator, who no doubt would be wearied out with such a number of distillations. The affair might appear trivial to him; and as he would perhaps know to which side Mr Boyle's opinion inclined, he might favour it, by mixing some white earth with the water. Had the experiment been tried by Mr Boyle's own hand, his known character would have put the matter beyond a doubt.

12
Existence of
elements
disputed.
as

Even the existence of earth as an element, appears

THEORY.

THEORY.

15
Chemical
attraction.

as dubious as that of the others; for it is certain that there is no species of earth whatever, from which we can produce two dissimilar bodies, by adding their other component parts.—Thus, the earth of alum has all the characters of simplicity which we can desire in any terrestrial substance. It is white, insipid, inodorous, and perfectly fixed in the fire; nevertheless, it seems to be only an element of that particular body called alum: for though alum is composed of a pure earth and vitriolic acid joined together, and Epsum salt and selenite are both composed of a pure earth combined with the same acid; yet by adding oil of vitriol to the earth of alum, in any possible way, we shall never be able to form either Epsum salt or selenite. In like manner, though all the imperfect metals are composed of inflammable matter joined with an earthy basis; yet by adding to earth of alum any proportion we please of inflammable matter, we shall never produce a metal; and what is still more mortifying, we can never make the earthy basis of one metallic substance produce any other metal than that which it originally composed. See EARTH.

13
Elements
necessarily
invisible.

A little consideration upon the subject of elements will convince us, not only that no such bodies have ever yet been discovered, but that they never will; and for this plain reason, that they must be in their own nature invisible.—The component parts of any substance, may with propriety enough be called the elements of that substance, as long as we propose carrying the decomposition no farther; but these elements have not the least property resembling any substance which they compose. Thus, it is found that the compound salt called *sal ammoniac* is formed by the union of an acid and an alkali: we may therefore properly enough call these two the elements of *sal ammoniac*; but, taken separately, they have not the least resemblance to the compound, which is formed out of them. Both the acid and alkali are by themselves so volatile as to be capable of diffipation into an invisible vapour by the heat of one's hand; whereas, when joined together, they are so fixed as almost to endure a red heat, without going off. If, again, we were to seek for the elements of the acid and alkali, we must not expect to find them have any properties resembling either an acid or an alkali, but others quite different; and if we could discover any thing which was the common element of *all* bodies, we believed to find a substance which had no property in common with any other in the whole system of nature, and consequently behaved to be imperceptible.

14
Supposition
concerning
phlogiston.

To the above mentioned four elements, *viz.* fire, air, earth, and water, a kind of *fifth* element has generally been added, but not usually distinguished by that name, though it has apparently an equal, if not a greater, right to the title of an *element* than any of the others. This substance is called the *phlogiston*, or inflammable principle; on which the ignition of all bodies depends. Some have imagined this substance to be the same with fire, or the matter of heat and light; but very absurdly: for the phlogiston is always displaced, and to appearance destroyed by fire; which it could not be if itself were either heat or light. See PHLOGISTON.

Before we proceed to give a general theory of the

changes which happen upon the mixtures of different bodies together, or expoding them singly to heat, we must observe, that all of them depend on certain qualities in bodies, by which some of them are apt to join together and to remain united while they have an opportunity. The cause of these qualities is totally unknown; and therefore, philosophers, after the example of Sir Isaac Newton, have expressed the apparent effect of this unknown cause by the word *attraction*. From them the word has been adopted by the chemists; and is now generally used in speaking of the phenomena which are observed in the mixture of different substances.

This attraction is not equally strong between all substances; in consequence of which, if any body is compounded of two others, and another is presented to it which has a greater attraction for one of the component parts than they have for one another, the substance will be *decomposed*. A new compound is then formed by the union of that third substance with one of the component parts or *elements* (if we please to call them so) of the first. If the attraction between the body superadded, and either of the component parts of the other, is not so strong as that between themselves, no decomposition will ensue; or if the third substance is attracted by both the others, a new composition will take place by the union of all the three.

16
Objects of
chemistry,
how clas-
sified.

The objects of chemistry, as we have already observed, are so various, that an enumeration of them all is impossible. To ease the mind therefore, when speaking of them, and render more useful any thing that is said or wrote on chemistry, it is necessary to divide them into different classes, comprehending in each class those bodies which have the greatest resemblance to one another, and to which one common rule applies pretty generally.—The division formerly used, was that of vegetables, animals, and minerals; but this has been thought improper, as there are many substances in each of those kingdoms which differ very widely from one another, and which are by no means subject to the same laws. The most approved method, at present, of arranging the objects of chemistry is into Salts; earths; metals; inflammable substances; waters; animal, and vegetable, substances.

SECT. I. Salts.

17
Salts.

I. Salts are either *sublime*, that is capable of abiding the fire, and melting in a strong heat, without being dissipated; or *volatile*, that is, being dispersed in vapour with a small heat. Their other properties are, that they are soluble in water; not inflammable, unless by certain additions; and give a sensation of taste, when applied to the tongue.

The most general characteristic of salts is, that they are all soluble in water, though some of them much more difficultly than others. Most of them have likewise the property of forming themselves, in certain circumstances, into solid transparent masses of regular figures, different according to the different salt made use of, and which are termed *crystals* of that salt. In this state they always contain a quantity of water; and therefore the utmost degree of purity in which a salt can be procured, is when it has been well crystallized, and the crystals are freed of their superfluous moisture

THEORY.

18
Phenomena
attending
their solu-
tion.

moisture by a gentle heat. They generally appear then in the form of a white powder.

In the solution of salts in water, the first thing observable is, that the water parts with the air contained in it; which immediately rises to the top, in the form of bubbles. This, however, is most remarkable when the salt is in the dry form we have just now mentioned, because there is always a quantity of air entangled among the interfaces of the powder, which rises along with the rest; and this discharge of air is sometimes so great, as to be mistaken for an effervescence. From this however, it is essentially different. See EFFERVESCENCE.

Another thing observable in the solution of salts is, that a considerable change happens in the temperature of the water in which they are dissolved; the mixture becoming either a good deal warmer or colder than either the salt or the water were before. In general, however, there is an increase of cold, and scarce any salt produces heat, except when it has been made very dry, and deprived of that moisture which it naturally requires; and thus the heating of salts by being mixed with water may be explained on the same principle with the heat produced by quick-lime. See QUICKLIME.

After salt has been dissolved in a certain quantity by water, no more of that salt will be taken up, unless the water is heated; and as long as the heat continues to increase, the salt will be dissolved. When the water boils, at which time it has attained its greatest heat, and will take up no more salt, it is then said to be *saturated* with that salt. This, however, does not prevent it from taking up a certain quantity of another salt, and after that perhaps of a third, or fourth, without letting go any of the first which it had dissolved. How far this property of water extends, has not yet been ascertained by experiments.

To the above rule there is only one exception known as yet; namely, common sea-salt: for water dissolves it in the very same quantity when cold, as when boiling hot. It has been said by some, that all deliquescent salts, or those which grow moist on being exposed to the air, had the same property: but this is found to be a mistake.

19
Mixture and separation
of salts.

This property of solubility, which all the salts possess in common, renders them easily miscible together; and the property by which most of them shoot into crystals renders those easily separable again which have no particular attraction for one another. This is likewise rendered still more easy by their requiring different proportions of water, and different degrees of heat, to suspend them; for by this they crystallize at different times, and we have not the trouble of picking the crystals of one out among those of the other.

20
Hypothesis
concerning
the solution
of salts.

The manner in which the solution of salts in water is effected, is equally unaccountable with most of the other operations of nature. Sir Isaac Newton supposed that the particles of water got between those of the salt, and arranged them all at an equal distance from one another: and from this he also accounts for the regular figures they assume on passing into a crystalline form; because, having been once arranged in an orderly manner, they could not come together in

THEORY.

disorder, unless something was to disturb the water in which they were suspended; and if any such disturbance is given, we find the crystals are by no means so regular as otherwise they would have proved. Others have thought that these figures depend on a certain *polarity* in the very small particles into which the salt is resolved when in a state of solution. These things, however, are merely conjectural; neither is it a matter of any consequence to a chemist whether they are right or wrong.

Though solution is that operation which salts undergo the most easily, and which should seem to affect them the least of any, a repetition of it proves nevertheless very injurious to them, especially if it is followed by quick evaporation; and the salt, instead of being crystallized, is dried with a pretty strong heat. Newman relates, that a pound of sea-salt was reduced by 13 solutions, and exsiccations, to half an ounce; and even that was mostly earth. Where solution is required, therefore, it ought always to be done in close vessels, in which also the subsequent evaporation should be performed, (see EVAPORATION); and in all cases where crystallization is practicable, it ought to be preferred to violent exsiccation.

21
Salts de-
structible
by repeated
solutions.

The two great divisions of salts are into acids and alkalis. The first of these are known by their peculiar taste, which is called *acid*, or *sour*. They are not found in a solid form; neither are any of them, except the acids of vitriol, of tartar, of phosphorus, and of borax, capable of being reduced to solidity. The others, when highly concentrated, that is, brought to the utmost degree of strength of which they are capable, always become an invisible vapour, permanently elastic, until it comes in contact with water, or some other substance with which they are capable of uniting. For such acids the name of *salts* seems less proper, as we can scarcely say that a *vapour*, which is already much more fluid than water, can be *dissolved* in that element.

22
Acids.

The acids are divided into the mineral, the vegetable, and the animal; expressing their different origin, or where they are most commonly to be found. The mineral acids are commonly reckoned three; the vitriolic, the nitrous, and the marine. To this the acid of borax ought to be added; but its weakness makes it much less taken notice of as an acid than the others. A Swedish chemist, however, Mr Scheele, hath lately added a new acid to the number of the mineral ones, under the name of the *fluor acid*.

The vegetable kingdom affords only two distinct species of acids. The one appears fluid, and when concentrated to the utmost degree becomes an invisible vapour. This is produced from fermented liquors, under the name of *vinegar*. An acid similar to this, and which is thought not to be essentially different from it, is found in the juices of certain fruits, as lemons, &c. and is extracted from most vegetables by distillation with a strong fire. The other is likewise a consequence of fermentation; and crusts on the bottom and sides of casks in which wine is put to dehydrate itself. In its crude state it is called *tartar*; and when afterwards purified, is called the *cream*, or crystals, of tartar.

The animal acids, which have hitherto been discovered,

THEORY.

vered, are only two; the acid of ants, and that of urine, which is also the acid of phosphorus. The first of these is volatile; and consequently must be supposed a vapour; when in its strongest state the other is exceedingly fixed; and will rather melt into glass, than rise in vapours. Besides these, it is said an acid is contained in blood; in wasps, bees, &c.: but no experiments have as yet been made on these to determine this matter with any degree of precision.

23
Alkalies.

The alkalies are of two kinds; fixed and volatile. The fixed kind are subdivided into two; the vegetable, and mineral or fossil alkali. The vegetable is so called, because it is procured from the ashes of burnt vegetables; the fossil, because it is found native in some places of the earth, and is the basis of sea-salt, which in some places is dug out of mines in vast quantity. They are called *fixed*, because they endure a very intense degree of heat without being dissipated in vapour, so as even to form a part of the composition of glass. The volatile alkali is generally obtained by distillation from animal substances. In its pure state this alkali is perfectly invisible; but affects the sense of smelling to such a degree, as not to be approached with safety.

24
Different
action of
alkalies and
acids.

The acids and alkalies are generally thought to be entirely opposite in their natures to one another. Some, however, imagine them to be extremely similar, and to be as it were parts of one substance violently taken from each other. Certain it is, that when separated, they appear as opposite to one another, as heat and cold. Their opposite action indeed very much resembles that of heat and cold, even when applied to the tongue; for the alkali has a hot, bitter, burning taste, while the acid, if not considerably concentrated, always gives a sensation of coldness. In their action too upon animal substances, the alkali dissolves, and reduces the part to a mucilage; while the acid, if not very much concentrated, tends to preserve it uncorrupted.

25
Neutral
salts.

If an alkaline salt, and moderately strong acid in a liquid state, be mixed together, they will immediately unite; and, provided the alkali has not been deprived of its fixed air, their union will be attended with a very considerable effervescence: (see AIR, n° 13). If the alkali has been deprived of air, no effervescence will ensue, but they will quietly mix together; but if a due proportion of each has been added, the liquor will neither have the properties of an acid nor an alkali, but will be what is called *neutral*. The bringing the liquor into this state, is called *saturating* the acid, or alkali, or combining them to the point of saturation.

If the liquor after such a saturation be gently evaporated, a saline mass will be left, which is neither an acid nor an alkali, but a new compound formed by the union of the two, and which is called a *perfect neutral salt*. The epithet *perfect* is given it, to make a distinction between the salts formed by the union of an acid and an alkali, and those formed by the union of acids with earthy or metallic substances; for these will likewise unite with acids, and some of the compounds will likewise crystallize into regular figures; but, because of their weaker union with these substances, the salts resulting from combinations of this kind are called *imperfect*.

Vol. III.

THEORY.

26
Vegetable
colours
changed by
acids and
alkalies.27
Differences
in the de-
grees of at-
traction be-
tween acids
and alkalies.

All acids, the volatile sulphureous one excepted, change the blue infusions of vegetables, such as violets, to a red; and alkalies, as well as some of the imperfect neutrals, change them green. This is the nicest test of an acid or alkali abounding in any substance, and seems the most proper method of determining whether a solution intended to be neutral really is so or not.

Though between every acid and alkali there is a very strong attraction, yet this is far from being the same in all; neither is it the same between the same acid and alkali in different circumstances of the acid. When the acids are in a liquid state, and as free as possible of inflammable matter, between which and the nitrous and vitriolic acids there is a very strong attraction, the vitriolic acid will expel any of the rest from an alkaline basis, and take its place. Thus, if you combine the acid of sea-salt, or marine acid, to the point of saturation, with the fossil alkali, a neutral salt will be formed, which has every property of common salt; but, if you pour on a certain proportion of the vitriolic acid, the acid of sea-salt will immediately be expelled; and the liquor, upon being evaporated, will contain not the neutral salt formed by an union of the marine acid with the alkali, but another consisting of the vitriolic acid joined with that alkali, and which has quite different properties from the former.

When the acids and alkalies are applied to one another in a liquid state, the vitriolic acid always shews itself to be the most powerful; but when applied in a solid form, and urged with a violent heat, the case is very much altered. Thus, the acid of borax, commonly called *sal sedativus*, is so weak as to be disengaged from its basis by every acid applied in a liquid form, that of tartar alone excepted; but if even the vitriolic acid combined with an alkali be mixed with this weak acid, then exsiccated, and at last urged with a vehement fire, the vitriolic acid will be disengaged from its basis, and rise in vapours, leaving the weaker acid in possession of the alkali. The same thing happens on adding the phosphoric or urinous acid, to combinations of the vitriolic or other acids with alkaline salts.—When the acids are in a liquid state, then, the most powerful is the vitriolic; next, the nitrous; then the marine; then vinegar; acid of ants; and lastly the *sal sedativus* and tartar, which seem to be nearly equal in this respect. As for the fluor acid, no great number of experiments have as yet been made upon it, and Dr Priestley hath rendered it very probable that this new acid is no other than the vitriolic.—If they are applied in a solid form, the most powerful are the *sal sedativus*, and phosphoric acid; then the vitriolic, nitrous, marine, and vegetable acids.

When they are reduced to vapour, the case is exceedingly different; for then the marine acid appears to be the most powerful, and the vitriolic the least of any. It is impossible, however, to preserve the vitriolic acid in the form of vapour, without combining it with a certain quantity of inflammable matter, which must necessarily destroy its strength. Dr Priestley, however, found, that the marine acid, when reduced to vapour, was capable of disuniting the nitrous acid from a fixed alkali.

10 U

The

THEORY.

28
Acids with
phlogiston.

The acids have the property of uniting themselves to many other substances besides fixed alkalies, and forming neutral compounds with them. Of these the chief is the principle of inflammability, or phlogiston. In the vitriolic, nitrous, and phosphoric acids, the attraction for this principle is very strong; so great, that the two former will even leave a fixed alkali to unite with it. In the marine acid it is less perceptible; in the liquid vegetable or animal acid still less; and in the acid of tartar, and fal sedativus, not at all.

29
With met-
als and
earth.

Besides this, all acids will dissolve metallic and earthy substances: with these, however, they do not in general unite so firmly as with alkaline salts; nor do they unite so strongly with metals as with earths.

30
Elective
attractions.

In general, therefore, we may expect, that after having dissolved a metal in any acid whatever, if we add an earthy substance to that solution, the acid will quit the metal which it had before dissolved, to unite with the earth. In this case the solution will not be clear, as before; but will remain muddy, and a quantity of powder will fall to the bottom. This powder is the metalline substance itself, but deprived of one of its component parts; and in this case it is said to *precipitate* in the form of a *calx*.

If to this new solution of the earthy substance in an acid liquor, a volatile alkaline salt, not deprived of its fixed air, is added, the acid will quit the earth, and unite with the alkaline salt. The earth thus disengaged will again *precipitate*, and lie at the bottom in fine powder, while the volatile alkali and acid remain combined together, and the liquor again becomes clear.

The attraction between volatile alkalies and acids is considerably less than between fixed alkalies and the same acids. If, therefore, a fixed alkali be now added to the liquor, the volatile alkali will be separated, and the acid will unite with the fixed alkali. The volatile alkali indeed, being perfectly soluble in water, cannot precipitate, but will discover its separation by the pungent smell of the mixture; and upon evaporating the liquor, the volatile alkali will be dissipated, and a saline mass consisting of the acid and fixed alkali will remain.

31
Detonation
of nitre.

Lastly, if the acid employed was the nitrous, which has a strong attraction for the principle of inflammability, if the saline mass be mixed with a proper quantity of inflammable matter, and exposed to a strong heat, the acid will leave the alkali with vast rapidity, combine with the inflammable matter, and be destroyed in flame in a moment, leaving the alkali quite pure.

32
Experiments
to the above
rules.

Though the above-mentioned effects generally happen, yet we are not to expect that they will invariably prove the same, whatever acid is made use of; or even that they will be the same in all possible variety of circumstances in which the same acid can be used.—The acid of tartar is one exception, where the general rule is in a manner reversed; for this acid will quit a fixed alkali for an earth, especially if calcined, and even for iron. If lead, mercury, or silver, are dissolved in the nitrous acid, and a small quantity of the marine acid is added, it will separate the stronger nitrous acid, and fall to the bottom with the metals, in form of a white powder.—The vitriolic acid,

by itself, has a greater attraction for earthy substances than for metals; and greater still for fixed alkaline salts than for either of these: but if quicksilver is dissolved in the nitrous acid, and this solution is poured into a combination of vitriolic acid with fixed alkali, the vitriolic acid will quit the alkali to unite with the quicksilver. Yet quicksilver by itself cannot easily be united with this acid.

SECT. II. Earths.

THESE are divided into five classes: 1. Absorbent, alkaline, or calcareous earths. 2. Argillaceous earths, or clays. 3. The stony. 4. The fusible earths; and, 5. The talcs.

1. The first class comprehends all those that are capable of being converted into lime. They are found of various degrees of hardness; but none of them are capable of totally resisting the edge of a knife, or striking fire with steel. They are found to consist of a very friable earth, joined with a large quantity of air, and some water. They effervesce with an acid when poured on them; by which they are distinguished from all other kinds of earth, except the argillaceous. When calcined by a strong fire, they part with the water and air which they contained, and then acquire a great degree of causticity, lose their power of effervescing with acids, and become what is called *quicklime*. They are soluble in acids, but not equally so in all. The vitriolic and tartareous acids form compounds with them very difficultly soluble; the *fenites*, formed by the vitriolic acid and calcareous earth, requiring, according to Mr Beauré, an ounce of water to dissolve a single grain of it. The solubility of the tartareous fenite, hath not yet been determined.—With the other mineral acids, the calcareous earths become easily soluble; and by proper management form concretes which appear luminous in the dark, and are called *phosphori*.

2. The argillaceous earths differ from the calcareous, in not being convertible into quicklime. When mixed into a paste with water, and exposed to the fire, they shrink remarkably, crack in many places, and become excessively hard. By being gently dried in the open air before they are turned, they do not crack, and thus may be formed into vessels of any shape. Of this kind of earth are formed all the brown sort of earthen ware. The purest kind of argillaceous earth naturally found, is that whereof tobacco-pipes are made.

All the argillaceous earths are soluble in acids. With the vitriolic they dissolve into a gelatinous tough liquor very difficultly crystallizable; but which, on the addition of some fixed or volatile alkali, may be flung into crystals of the salt called *alum*. With the other acids they form astringent salts of a similar nature.

The attraction between the argillaceous earths and acids is very weak, yielding not only to alkaline salts both fixed and volatile, but even to some metals, particularly iron; but these earths have as yet been but little the subject of chemical examination in this way. They have a remarkable property of absorbing the colouring matter of cochineal, Brazil-wood, &c. as have also the calces of some metals. See LAKE.

Both the calcareous and argillaceous, and indeed all earths

THEORY.

33
General di-
vision.

34
Quicklime.

35
Argillace-
ous.

THEORY.

THEORY.

earths when pure, resist the utmost violence of fire; but when mixed together will readily melt, especially if in contact with the burning fewel. Dr Lewis having made covers to some crucibles of clay and chalk mixed together, found, that they melted into a yellow glass, before the mixtures in the crucibles were fused in the least. But though they melted thus readily when in contact with the fewel, it was with great difficulty he could bring them to a transparent glass when put into a crucible. See GLASS.

The other species of earths, *viz.* the stony, fusible, and talcy, being no other way the subjects of chemistry than as they are subservient to the making of glass, all that can be said of them will most properly come under that article. For their different species, see MINERALOGY.

36
Anomalous
earths.

Besides the above mentioned species of earths, there are others which may be called *anomalous*, as having some resemblance of the calcareous and argillaceous, and yet being essentially different from them. These are the white earth called *magnesia alba*, the earth of burnt vegetables, and that produced from burning animal substances.

37
Magnesia.

Magnesia alba was at first prepared from the thick liquor remaining after the crystallization of nitre; and is now found to be contained in the liquor called *bittern*, which is left after the separation of common salt from sea-water. In the former case it was united with the *nitrous*, in the latter with the *vitriolic*, acid. It is also found naturally in the soft kind of stone called *steatites* or "soap-stone;" and in the concrete used for taking spots out of cloaths, called *French chalk*. It differs from the calcareous earths, in not acquiring any causticity when deprived of its air, of which it contains so large a quantity as to lose two-thirds of its weight when calcined. From the argillaceous it differs in not burning hard when mixed with water, nor forming a tough ductile paste. It is easily soluble in all the acids, even the vitriolic; with which it forms the bitter purging salt commonly called *Epsum salt*, from its being first discovered in the waters of Epsum. With all the other acids it likewise forms purgative compounds, which are either very difficultly or not at all crystallizable.—Like other pure earths, it cannot be melted by itself; but, on proper additions, runs into a beautiful green glass.

38
Vegetable
and animal
earths.

The earth of burnt vegetables is thought by Dr Lewis to be the same with magnesia alba; but on trying the common wood ashes, they were found to be very different. This kind of earth is fusible, by reason of the alkaline salts contained in it. Animal earth is both very difficult of solution in acids, and impossible to be melted in the strongest fire. It dissolves, however, in acid liquors, though slowly; but the nature of the compounds formed by such an union are as yet unknown. The softer parts of animals, such as blood, flesh, &c. are said to yield a more soluble earth than the others.

SECT. III. Inflammable Substances

39
Phenomena
on burning.

THESE comprehend all vegetable, animal, and some mineral substances. They are distinguished from all others, by emitting a gross thick smoke and flame,

when a certain degree of heat is applied. To this, however, spirit of wine and all preparations from it are exceptions. They burn without the least smoke; and if a glass bell is held over the burning spirit, no foot is formed, only a quantity of water is found condensed on its sides. Even the grosser oils, if slowly burnt with a very small flame, will yield no foot; and an exceeding great quantity of water, fully equal in weight and bulk to the oil employed, may be obtained from them. We can scarcely, however, credit that such a quantity of water comes from the oil; as this would be a real transmutation; and we know, that, besides water, the oils contain also some quantity of fixed air, as well as earth. It is probable, therefore, that, as it is impossible to sustain flame without a decomposition of that part of the air which rushes in to support it, great part of the water in this case comes from the air, which always contains moisture in abundance.

Inflammable matters, on being burnt, generally leave behind a small quantity of earthy matter called *ashes*; but to this, spirit of wine, camphor, the more volatile oils, and the mineral oil called *naphtha*, are exceptions. Vegetable substances when distilled in close vessels give out a quantity of air, some acid, and an empyreumatic oil, leaving behind a black spongy mass called *charcoal*. To this too there are a few exceptions, *viz.* spirit of wine, and the preparations from it, camphor, and perhaps some of the more volatile oils, or naphtha. Animal substances yield only a very fetid empyreumatic oil, and volatile alkali.

In general, all inflammable matters are acted upon with some violence by the vitriolic and nitrous acids, excepting only camphor and naphtha. With the vitriolic acid, when in a liquid state, they render it volatile and sulphureous; if in a dry state, they form actual sulphur. With the nitrous, they first impart a high colour and great degree of volatility to the acid; then a violent flame ensues, if the matter is attempted to be dried. With spirit of wine the effects are considerably different; and very volatile compounds are formed, which are called *ether*, on account of their exceeding great disposition to rise in vapour. Similar compounds are likewise produced, but with more difficulty, from the marine acid and concentrated vinegar. The sal sedativus of borax mixes with spirit of wine, and causes it burn with a green flame; but does not seem to produce any other change upon it. How the acid of tartar, of phosphorus, and of acts, act upon spirit of wine, is not known. With any other inflammable matter, the phosphorine acid reproduces phosphorus.

There are two singularities observed among the inflammable substances. One is that bituminous matter called *amber*, which yields a volatile salt of an acid nature on distillation: When combined with alkalis, this acid is found to yield compounds similar to those made with the acetic acid and alkali. The other is, that gum called *benzoin*, which is used as a perfume, and yields by sublimation, a kind of volatile salt in fine shining crystals like small needles, and of a most grateful odour. These dissolve very readily in spirit of wine; but not at all in water, unless it is made very hot; so that they seem to contain more oily than saline matter.

10 U 2

Neither

THEORY.

THEORY.

Neither the nature of these flowers, however, nor that of the salt of amber, is fully known.

SECT. IV. Metalline Substances.

THESE are distinguished from all other bodies by their great specific gravity, exceeding that of the most dense and compact stones. The heaviest of the latter do not exceed the specific gravity of water in a greater proportion than that of 4 to 1; but tin, the lightest of all the metals, exceeds the specific gravity of water in the proportion of 7 to 1. They are also the most opaque of all known bodies, and reflect the rays of light most powerfully.

43
Metals soluble in acids.

Metalline bodies possess the quality of dissolving in and uniting with acid salts, in common with earths and alkalies; but, in general, their union is less perfect, and they are more easily separable. They effervesce with acids, as well as calcareous earths and alkalies; but their effervescence is attended with very different appearances. In the effervescence of acids with alkalies, or with calcareous earths, there is a discharge of the fluid called *fixed air*, which is so far from being inflammable, that it will immediately extinguish a candle, or other small flame immersed in it. The mixture also is notably diminished in weight. When a metalline substance is dissolved in an acid, the weight of the mixture is never very much diminished, and sometimes it is increased. Thus, an ounce of quicksilver being slowly dropped into as much aqua fortis as was sufficient to dissolve it, and the solution managed so as to take up almost a whole day, the whole was found to have gained 7 grains. There is also a remarkable difference between the nature of the vapour discharged from metals, and that from alkalies; the former, in most cases, taking fire and exploding with violence; the latter, as already observed, extinguishing flame.

44
Their composition.

The metalline substances, at least such as we are able to decompose, are all composed of a certain kind of earth, and the inflammable principle called *phlogiston*. The earthy part by itself, in whatever way it is procured, goes by the name of *calx*. The other principle hath never yet been seen by itself. When these two principles are separated from one another, the metal is then said to be *calcined*. The calx being mixed with any inflammable substance, such as powdered charcoal, and urged with a strong fire, melts into metal again; and it is then said to be *reduced*, or *revivified*: and this takes place whether the metal has been reduced to a calx by dissolution in an acid, or by being exposed to a violent fire. If, however, the calcination by fire has been very violent and long continued, the calx will not then so readily unite with the phlogiston of the charcoal, and the reduction will be performed with more difficulty. Whether, by this means, *viz.* a long continued and violent calcination, metalline earths might entirely lose their property of combining with phlogiston, and be changed into those of another kind, deserves well to be inquired into.

46
Calcination and increase of weight by acids.

When a metalline substance is dissolved in any kind of acid, and an alkali or calcareous earth not deprived of its fixed air is added, the alkali will immediately be attracted by the acid, at the same time that the fixed air contained in the alkali is disengaged, and the

calx of the metal, having now no acid to keep it dissolved, immediately joins with the fixed air of the alkali, and falls to the bottom. Something similar to this happens when metals are calcined by fire. In this case, there is a continual decomposition of the air which enters the fire; and the fixed air contained in it, being, by this decomposition, set loose, combines with the calx; whence, in both cases, there is a considerable increase of weight. If the air is excluded from a metal, it cannot be calcined even by the most violent fire.

When a metal is precipitated by a mild alkali, or by an uncalcined calcareous earth⁴⁷ the reason of the increase of weight is very evident; namely, the adhesion of the fixed air to the metalline calx: but, though it is not so much increased when precipitated by caustic alkali, or by quicklime, there is nevertheless a very evident increase, which is not so easily accounted for. M. la Voisier, has mentioned some experiments made on mercury and iron dissolved in aqua fortis, which deserve to be taken notice of, as in a great measure accounting for the phenomenon already mentioned of the solution of metalline substances gaining an addition of weight; and likewise shew the proportion of increase of weight with the mild, or calcined calcareous earth.

“Exactly 12 ounces of quicksilver,” says he, “were put into a matras, and 12 ounces of spirit of nitre⁴⁸ poured on it. Immediately a spontaneous effervescence ensued, attended with heat. The red vapours of the nitrous acid arose from the mixture, and the liquor assumed a greenish colour. I did not wait till the solution was entirely accomplished, before I weighed it; it had lost one drachm, 18 grains. Three hours after, the mercury was nearly all dissolved: but having again weighed the solution, I was much astonished to perceive, that it had increased instead of being diminished in weight; and that the loss, which was one drachm, 18 grains, at first, was now only 54 grains. The next day the solution of the mercury was entirely finished, and the loss of weight reduced to 18 grains; so that in 12 hours the solution, though confined in a narrow necked matras, had acquired an augmentation in weight of one drachm. I added some distilled water to my solution, to prevent it from crystallizing; the total weight of it was then found to be 48 ounces, one drachm, and 18 grains.

“I weighed separately, in two vessels, 8 ounces 15 grains of the above solution, each of which portions, according to the preceding experiment, ought to contain 2 ounces of nitrous acid, and 2 ounces of quicksilver. On the other side, I prepared 6 drachms 36 grains of chalk, and 4 drachms; 26 grains of lime these proportions having been found, by former experiments, just necessary to saturate two ounces of nitrous acid. I put the chalk in the one vessel, and the lime in the other.

“An effervescence attended the precipitation by chalk, but without heat; the mercury precipitated in a light yellow powder; at the same time the chalk was dissolved in the nitrous acid. The precipitation by the lime was effected without effervescence, but with heat; the mercury was precipitated in a brownish powder. When the precipitates were well subsided, I decanted off the liquors from them, and carefully edulcorated

Reason of the increase of weight in metalline calces.

M. la Voisier's experiments.

edulcorated them. After which, I caufed them to be dried in a heat nearly equal to that in which mercury boils.

" The precipitate by the chalk weighed 2 ounces, 2 drachms, 45 grains; that by the lime, weighed 2 ounces, 1 drachm, 45 grains.

" Sixteen ounces of the nitrous acid, the fame as employed in the former experiments, were placed in a matrafs, and fome iron filings gradually added. The effervescence was brisk, attended with great heat, red vapours, and a very rapid difcharge of elastic fluid: the quantity of iron neceffary to attain the point of faturatıon, was two ounces, four drachms; after which, the lofs of weight was found to be 4 drachms, 19 grains. As the folution was turbid, I added as much diftilled water as made the whole weight of the folution to be exactly 6 pounds.

" I took two portions, each weighing 12 ounces of the above folution, and containing 2 ounces of nitrous acid, and 2 drachms 36 grains of iron filings. I placed them in two feparate veffels: to one were added 6 drachms 36 grains of chalk; and to the other, 4 drachms 36 grains of flacked lime, being the quantities neceffary to faturate the acid.

" The precipitation was effected by the chalk with effervescence and tumefaction; that by the lime, without either effervescence or heat. Each precipitate was a yellow brown ruft of iron. They were washed in feveral parcels of diftilled water, and then dried in an heat fomewhat fuperior to that ufed in the laft experiment.

" The precipitate by the chalk, when dried, was a greyish ruft of iron, inclining even to white by veins; it weighed 6 drachms, 35 grains; that by the lime was rather yellower; and weighed 4 drachms, 69 grains.

" The refults of thefe experiments," fays M. la Voifier, " are, 1. That iron and mercury diffolved in the nitrous acid, acquire a remarkable increafe of weight, whether they be precipitated by chalk or by lime. 2. That this increafe is greater in refpect to iron than mercury. 3. That one reafon for thinking that the elastic fluid contributes to this augmentation is, that it is confantly greater when an earth is employed, faturated with elastic fluid, fuch as chalk, than when an earth is ufed which has been deprived of it, as lime. 4. That it is probable that the increafe of weight, which is experienced in the precipitation of lime, although not fo great as that by chalk, proceeds in part from a portion of the elastic fluid which remains united to the lime, and which could not be feparated by the calcination."

But though we are naturally enough inclined to think that the increafe of weight in the precipitates formed by lime proceeded from fome quantity of elastic fluid or fixed air which remained combined with the lime, it is by far too great to be accounted for in this way, even according to the experiments mentioned by M. la Voifier himfelf, and which, from the manner in which they are told, appear to have been performed with the greateft accuracy. He found, that 1 ounce 5 drachms and 36 grains of flacked lime contained 3 drachms and 3 quarters of a grain of water, and only 16 grains and an half of elastic fluid

were feparable from it. In the experiments above related, where only 4 drachms and 36 grains were employed, the quantity of elastic fluid could not exceed 6 or 8 grains. Yet the calx was increafed in mercury, by no lefs than 105 grains; and in iron, by 203 grains; a quantity quite unaccountable from the elastic fluid, or fixed air, which we can fuppofe to be contained in the lime made ufe of.

It is much to be regretted, that the ingenious author of thefe experiments did not make ufe of the calces of metals obtained by lime, when trying to expel air from fuch fubftances by violent heat. This would have been the *experimentum crucis* in this cafe; and could an elastic fluid, fimilar to fixed air, be extracted from a metalline calx, precipitated by a fubftance which could communicate none to it, it would be as ftrong a proof of the *generation* of fuch air, as Dr Priestley's extraction of pure air from metalline calces and fpirit of nitre is a proof of the original production or *generation* of air from thefe fubftances.

That the increafe of weight in metalline calces prepared by fire is owing to an adhefion of air to them, is put beyond a doubt, becaufe that air can be expelled from them. That the increafe of weight in the calces prepared from metals diffolved in acids and precipitated by quicklime is owing to the fame caufe, hath not been proved, becaufe nobody hath tried whether air can be expelled from them or not; at leaft we have not met with an account of any experiments where fuch calces were made ufe of. Hence there is as yet an uncertainty in this fubject; and different theories have been invented to explain it. The moft remarkable is the following.

Metals are found to be compounded of a kind of earth mixed with the inflammable principle or phlogifton. The latter is a fubftance fo volatile, and which fo much eludes our moft accurate fearch, that it is thought to be a principle fomewhat like that known in former ages by the name of *positive levity*. This principle is not only thought to have no tendency towards the earth, or not to be acted upon by the caufe of gravitation, but to have a natural tendency upwards. Hence, in proportion as any body contains more of the phlogifton, and lefs of other principles, it is fo much lighter, by reafon of the tendency of the inflammable principle upwards, which forms fome kind of counterpoife to the action of the caufe of gravity on the other principles. The confequence of this is, that when any fubftance is deprived of its inflammable principle, it ought to be rendered heavier, and actually is fo; (fee FIRE). When a metal, therefore, is deprived of its phlogifton, we ought not to impute the increafe of weight to any thing elfe than the want of the phlogifton, which formerly balanced in fome meafure the action of gravity upon the metalline calx.

In fupport of this theory, the increafe of weight in a metalline folution of quickfilver, for inftance, has been urged: but the experiments adduced in this way are now found to be falacious.

Another argument made ufe of in fupport of this theory is, that metalline calces, though they are increafed in abfolute weight, are neverthelefs very deficient in fpecific gravity. This, however, feems fo far from the purpofe, that it appears to us to prove the direct contrary of

what

49
Consequences from his experiments.

50
Not well founded.

51, [52]
Positive levity of the phlogiston asserted.

THEORY. what is intended. If the phlogiston is a principle of positive levity, and whatever substance contains the largest proportion of it is the lightest; then it follows, that the metalline calces, being deprived of this principle of levity, ought to be specifically *heavier* than after they are combined with it, and assume the metalline form; but as the metals themselves are always found specifically heavier than their calces, we are altogether at a loss for any solid argument in favour of the positive levity of the phlogiston. It is true, if two metals are mixed together, the compound sometimes turns out specifically heavier than either of them taken separately. This no doubt is a curious fact; but is no more extraordinary than that a quantity of salt should dissolve in water without increasing its bulk, (see FLUIDITY), and so render it specifically heavier than before, by more than the difference between the specific gravity of water and of salt. Thus, suppose the specific gravity of salt to water as 2 to 1. A cubic inch of salt then, dissolved in 5 cubic inches of water, ought to increase the bulk to 6 cubic inches, and render the water $\frac{2}{3}$ specifically heavier than before. But if we suppose the quantity of water capable of receiving a cubic inch of salt, without any addition to its bulk, the specific gravity of the fluid will then be increased by $\frac{2}{3}$. In like manner, if a cubic inch of silver, the specific gravity of which is as 11, receives half a cubic inch of mercury, the specific gravity of which is as 14, without increasing its bulk, the specific gravity of the mixture will be as 18; and mixtures of these two metals are found to be of considerably greater specific gravity than either the silver or mercury by themselves.

In this case, however, we mix two gravitating bodies together, and, by something resembling a *penetration of dimensions*, they become specifically heavier; but if we mix a gravitating substance with one which does not gravitate at all, we can never make a compound specifically heavier than before. If, instead of a substance which barely does not gravitate, we take one which is *positively light*, we will be so far from making a compound specifically heavier than the original substance was, that it must necessarily be lighter, let us do as we will. The decrease of specific gravity, therefore, in metalline calces, undeniably proves, that along with the dissipation of the phlogiston, there is something *added*, which, by itself, is specifically lighter than the metal originally was, and to which the decrease of specific gravity in the whole is owing.

Though all metallic bodies, gold, silver, and platinum excepted, are capable of being reduced to a calx by the action of heat alone, yet very different degrees of it are required for calcining them. Lead and tin begin to calcine as soon as they are melted, long before they are made red-hot. The same happens to the femimetals bismuth and zinc; the latter indeed, being combustible, cannot bear a greater heat in open vessels than that which is barely sufficient to melt it. Iron and copper require a red heat to calcine them; though the former may be made partly to calcine by being frequently wetted in a degree of heat considerably below that which is sufficient to make it red.

Most metals undergo a kind of spontaneous calcination in the open air, which is called their *rusting*; and

which has given occasion to various conjectures. But M. la Voisier has shown, that this arises from the fixable part of the atmosphere attaching itself to their earthy part, and discharging the phlogiston. According to him, no metallic body can rust but where there is an absorption of air; and consequently metals can be but imperfectly rusted when kept under a receiver.

If two metals are mixed together, the compound generally turns out more fusible than either of them was before the mixture. There are indeed great differences in the degrees of heat requisite to melt them. Thus, lead and tin melt below that degree of heat which is required to make quicksilver or linseed-oil boil. Silver requires a full red heat, gold a low white heat, copper a full white, and iron an extreme white heat to make it melt. The femimetal called bismuth melts at about 460° of Fahrenheit's thermometer; and tin at about 422°. When mixed in equal quantities, the compound melted at 283°. When the tin was double the bismuth, it required 334° to melt it; with eight times more tin than bismuth, it did not melt under 392°. If to this compound lead is added, which by itself melts in about 540°, the fusibility is surprisingly increased. Mr Homborg proposed for an anatomical injection a compound of lead, tin, and bismuth, in equal parts; which he tells us keeps in fusion with a heat so moderate that it will not singe paper. Sir Isaac Newton contrived a mixture of the above mentioned metallic substances, in such proportions that it melted and kept fluid in a heat still smaller, not much exceeding that of boiling water. A compound of two parts of lead, three parts of tin, and five of bismuth, did but just stiffen at that very heat, and so would have melted with very little more; and when the lead, tin, and bismuth, were to one another in the proportions of 1, 4, and 5, the compound melted in 246°. We have seen, however, a piece of metal compounded of these three, the proportions unknown, which melted, and even underwent a slight degree of calcination, in boiling water, and barely stiffened in a degree of heat so gentle that the hand could almost bear it.

A slight degree of calcination seems to give the acids a greater power over metalline substances; a greater makes them less soluble; and if long and violently calcined, they are not acted upon by acids at all. Of all the acids the marine has the greatest attraction for metallic calces, and volatilizes almost every one of them.

Sulphur readily unites with most metals, destroys their malleability, and even entirely dissolves them. On gold and platinum, however, it has no effect, till united with a fixed alkaline salt, when it forms the compound called *hepar sulphuris*; which is a very powerful solvent, and will make even gold and platinum themselves soluble in water, so as to pass the filter. This preparation is thought to be the means by which Moses dissolved and gave the Israelites to drink the golden calf which they had idolatrously fet up.

When a metal is dissolved in an acid, it may be precipitated, not only by means of calcareous earths and alkalies, but also by some other metals: for acids

THEORY.

do not attract all metals with equal strength; and it is remarkable, that when a metal is precipitated by another, the precipitate is not found in a calcined state, but in a metallic one. The reason of this is, that the precipitating metal attracts the phlogiston which is expelled from that which is dissolving, and immediately unites with it, so as to appear in its proper form. The various degrees of attraction which acids have for the different metals is not as yet fully determined. The best authenticated are mentioned in the Table of Affinities or Elective Attractions, (SECT. VII.)

59
Division into metals and semimetals.

Metalline substances are divided into metals and semimetals. The metals, which are distinguished from the semimetalline substances by their malleability or stretching under the hammer, are in number seven; gold, silver, copper, iron, lead, tin, and platina. To these is added quicksilver; which Mr Brown's experiments have shewn to be a real malleable metal, as well as others, but requiring so little heat to keep it in fusion, that it is always found in a liquid state. The semimetals are bismuth or tin-glass, zinc, regulus of antimony, and cobalt, nickel, and arsenic. This last substance is of a singular nature, and seems to possess a kind of middle nature between the metalline substances and salts. In common with the semimetals, it is capable of being united with the phlogiston in large quantity, when it assumes a splendid metalline form, but wants the ductility of a true metal; so can only be reckoned, even then, among the semimetals. It likewise unites with sulphur, with which it forms a compound of a red or yellow colour, according as more or less sulphur is used. This compound is easily fusible; though the arsenic, by itself, is so volatile as to go off all in vapour rather than melt. In common with the salts, it possesses the properties of dissolving in water, and uniting itself to alkalis. Water will dissolve about $\frac{1}{17}$ of its weight of pure arsenic; but if arsenic is boiled in a strong alkaline lixivium, a much greater proportion will be dissolved. Indeed strong alkaline lixivium will dissolve a part of almost every metalline substance, except gold, silver, and platina; but, excepting copper, which may be formed into crystals by means of the volatile alkali, none of them will assume a crystalline form when united with alkalis. Arsenic, on the contrary, unites very readily with fixed alkalis, and floats with them into a neutral salt. If it is mixed with nitre, it unites itself to the alkaline basis of that salt, and expels the acid in very volatile fumes, which are difficultly condensed into a blue liquor. The reason of this is probably the great attraction between the nitrous acid and phlogiston, which are always disposed to unite when a proper degree of heat is applied. Was the phlogiston contained in large quantity in the arsenic, and the heat sufficiently great, a violent deflagration would ensue; but as the arsenic attracts the alkaline part of the nitre, at the same time that the acid attracts the phlogiston, a double decomposition ensues, in a less degree of heat than would otherwise be necessary; and the nitrous acid arises in a very volatile state, as it always is when combined with phlogiston, which is the occasion of the blueness in aqua fortis so produced. The arsenic is also decomposed in part, by being deprived of its proper quantity of phlogiston;

THEORY.

in consequence of which it attaches itself so strongly to the fixed alkali of the nitre, that the salt formed by their union cannot be decomposed by the strongest acids. The only method is to prevent to this salt a metallic substance, which the arsenic unites with in preference to the alkali. The common arsenical salts made with arsenic having its due proportion of phlogiston and alkali, may be decomposed by acids. For the extraction of metallic substances from their ores, and the various methods of refining them, see METALLURGY.

SECT. V. Waters.

THE pure element of water, like that of fire, is so much an *agent* in most chemical operations, as to be itself very little the *object* of practical chemistry; no method being hitherto known of compounding or decomposing it. Waters, therefore, can only be the objects of chemistry in consequence of the impurities they contain: and, as these impurities are most commonly of the saline kind, it is impossible that any general theory can be given of waters, distinct from that of the salts contained in them; which all depend on the general properties belonging to salts, and which we have already mentioned. Any thing that can be said with regard to waters, then, must be postponed to the particular consideration of the properties of each of the saline bodies with which water is capable of being adulterated. We shall therefore refer entirely to the article WATER for what can be said on this subject.

61
Water, how far an object of chemistry.

SECT. VI. Animal and Vegetable Substances.

THE general chemical properties of these have been already taken notice of under the name of inflammable substances. They agree in giving out a very thick fœtid oil, when distilled by a strong fire; but in other respects they differ very considerably. Most kinds of vegetables give out an acid along with the oil; but all animal substances (ants, and perhaps some other insects, excepted) yield only a volatile alkali. Some kinds of vegetables, indeed, as mustard, afford a volatile alkali on distillation, similar to that from animal substances; but instances of this kind are very rare, as well as of animals affording an acid. Both animal and vegetable substances are susceptible of a kind of fermentation, called *putrefaction*, by which a volatile alkali is produced in great plenty: there is, however, this remarkable difference between them, that many vegetable substances undergo two kinds of fermentation before they arrive at the putrefactive stage. The first is called the *vinous*, when the ardent spirits are produced, which we have already mentioned when speaking of inflammable substances. This is succeeded by the *acetous*, wherein the vegetable acid called *vinegar* is produced in plenty: and lastly, the putrefactive stage succeeds when a volatile alkali is only produced; not the smallest vestige either of ardent spirits or of vinegar remaining. On the other hand, animal substances seem susceptible only of the putrefactive fermentation; no instance having ever occurred where there was the least drop, either of ardent spirit or of vinegar, produced from a putrified animal substance. (See FERMENTATION AND PUTREFACTATION.)

Invention
of marks
or charac-
ters.

SECT. VII. *Of the Chemical Characters, and
Tables of Elective Attraction.*

THE different marks or characters by which the ancient chemists used to denote many different substances, were invented rather from a superstitious and fantastical principle than from any real necessity; or, perhaps, like the ænigmatical language used by the alchemists, they have thereby sought to conceal their mysteries from the vulgar. In contriving these marks, they affected a great deal of ingenuity; intending them as symbols of the qualities possessed by each of the different substances. A circle being supposed the most perfect figure, was therefore used to represent the most perfect metal in nature, that is, *gold*. Silver being likewise a perfect and indestructible metal, is placed next to gold; but, on account of its inferiority, is expressed only by a crescent, as if but half gold. A circle was likewise used to denote salt of any kind, as being something elaborate and perfect. A cross was used to denote acrimony of any kind, and consequently employed for the acrimonious salts of vitriol, alkali, &c. Hence, all the inferior metals have the cross some-how or other combined with the marks designed to represent them. Thus, the mark for quicksilver denotes, that it hath the splendor of silver, the weight of gold, but its perfection is hindered by an acrimony represented by the cross at bottom, &c. Fire is represented by an equilateral triangle, having one of its angles uppermost. This may be considered as a rude representation of flame, which is always pointed at top. Water, again, is represented by a triangle, with an angle downwards, shewing the way in which that element exerts its strength, &c. All these marks, however, as they were of no real use at first, so they are now becoming every day more and more neglected. Such of them, however, as may most readily occur in chemical books are represented and explained on Plate LXXVI.

64
Of tables of
affinities.

Tables of affinities, or elective attractions, are but of late invention. They are consequences of an improved state of chemistry, when the different substances were found to act upon one another in most cases according to a fixed and settled rule. The most approved table of this kind for a long time was that composed by Mr Geoffrey. It was however found to be very incomplete, not only as to its extent, but likewise as heat and some other circumstances were found to vary the attractions considerably, and sometimes even to reverse them. Other tables have been constructed by Mr Gellert, &c. but none hath yet appeared so complete but that many additions may be made to it. The following is that at present exhibited by Dr Black in his course of chemistry:

THEORY.

THEORY.

In consequence of heat, sedative salt decomposes vitriolated tartar and sea-salt.—Phosphoric acid decomposes vitriolated tartar, nitre, and sea-salt.

Double Elective Attractions; which, in some cases, may be considered as exceptions to the foregoing table.

I. Those which happen in mixtures of watery substances.	
1. { Acids	Volatile alkali
{ Calc. earths, or metallic substances	Fixed air.
2. { Vitriolic or marine acids	Mercury, silver, or lead
{ Alkalies or earths	Nitrous or acetous acids.
3. { Lead	Vitriol acid
{ Nitrous, marine, or acetous acids	Alkalies, earths, or M. S.
4. { Silver	Marine acid
{ Vitriolic, nitrous, or acetous acids	Alkaline salts, earths, or M. S.
5. { Volatile alkali	Fixed air
{ Acids	Fixed alkali.
6. { Nitrous, marine, or acetous acids	Volatile alkali, magnesia, or earth of alum
{ Calcareous earths	Vitriolic acid.

II. Those which happen in distillations or sublimations, and require heat.

1. { Vol. alkali	Fixed air
{ Acids	Calcareous earths.
2. { Vol. alkali	Nitrous, marine, or acetous acids
{ Vitriol. acid	Fixed alkali.
3. { Vol. alkali	Acetous acid
{ Nitrous, marine, or vitriolic acids	Fixed alkali, or absorbent earths.
4. { Reg. of antimon.	Marine acid
{ Sulphur	Quicksilver.

III. Those which happen in mixtures by fusion.

1. { Tin	Iron
{ Silver	Lead.
2. { Copper	Sulphur
{ Gold	Lead.
3. { M. S.	Sulphur
{ Gold	Reg. of ant.

The first of these tables requires very little explanation. The names printed in small capitals, are those of the substances which have the affinity with or attract those below them. Thus, vitriolic acid attracts most powerfully the phlogiston, or inflammable principle; next, fixed alkali; then, calcareous earth; and so on, in the order in which they are marked.—The tables of double elective attractions cannot be made quite so distinct; though an explanation of one example will make this likewise easy to be understood. Thus in Table I. the first case is, “If a combination of acids with calcareous earths or metallic substances is mixed with a combination of volatile alkali and fixed

VOL. III.

air, the acids will unite themselves to the volatile alkali, and the fixed air to the calcareous earth or metallic substance.

SECT. VIII. *Of the different Operations in Practical Chemistry, and the proper Instruments for performing each.*

THE most remarkable operations in chemistry, and by which the greatest changes are made upon those bodies which are the objects of that science, may be comprehended under the following names. 1. Solution. 2. Filtration. 3. Precipitation, or coagulation. 4. Evaporation. 5. Crystallization. 6. Distillation. 7. Sublimation. 8. Dettiguration. 9. Calcination. 10. Fusion. 11. Maceration, or digestion. To which we may add, 12. Trituration, or levigation.

Before we proceed to a particular account of each of these operations, it is necessary to take notice, that there are two different things proposed by those who enter on the practice of chemistry. Some have nothing farther in view than the enlargement of their knowledge, or making improvements in arts which are to be practised by others for their own advantage. Others design to follow chemistry as a trade, by which they hope to enrich themselves, or to get a comfortable livelihood. But the apparatus and utensils necessary for performing the very same operations are exceedingly different when experiments only are to be made, from what they must be when these operations are performed with a view to profit; and so great is this difference, that those who pursue chemistry with a view to advantage, will always find themselves very considerable losers if they follow the plan of an apparatus or a laboratory designed only for making experiments. Along with the apparatus, therefore, which is commonly described in chemical books, and proper only for experiments, we shall also give that which is necessary for preparing great quantities of any chemical article in the way of trade.

In general, those who practise chemistry merely with an experimental view, ought, as much as possible, to make use of glass vessels, as not being liable to be corroded by the most powerful solvents; and, by their transparency, giving an opportunity of observing what passes within them during the operation. But, by those who practise chemistry with a different view, these vessels ought, with equal care, to be avoided, on account of their expence, and brittleness. This last quality, indeed, is possessed by glass in so eminent a degree, that glass vessels will sometimes fly to pieces, and that with considerable violence, when standing by themselves, and nothing touching them. The principal objects which a chemist ought to have in view, in performing his operations, ought to be to save time and fuel, especially the first; and for this purpose, he would find himself a considerable gainer, though he should be at much greater expence in his apparatus than he would otherwise have occasion for.

We shall now proceed to a particular description of each of the operations above mentioned; and first of

SOLUTION. By this is understood the dissolving a solid substance in a fluid, so as that the solid shall totally disappear, and become part of a transparent liquor.

68

Solution.

THEORY.

This operation applies particularly to salts, earths, and metals; as well as to several unctuous and inflammable substances. For performing this operation in a small way, common vials are in many cases sufficient. Where the solution is attended with effervescence and a discharge of vapours, the long-necked glasses called *matrasses*, or *bell-heads*, (fig. 5.), are necessary. Florence flasks are indeed exceedingly well adapted for this operation, as being of the proper shape, and capable of bearing heat so well, that they may be filled with any fluid, and set on a common fire like a metalline vessel. Solution is much promoted by agitating the vessel, and by heat. In some cases, indeed, it will not take place till the mixture becomes very hot; and in such cases it will be proper to make the fluid boiling hot by itself, and then slowly to add the substance to be dissolved.

Plate
LXXXVII.

When large quantities of saline matter are to be dissolved, metalline vessels must be used: but before any are made use of for this purpose, it will be necessary to make an experiment whether the salt receives any impregnation from the metal of which the vessel intended to be made use of is formed; and if this is found to be the case, it must not be used. The metals most liable to be corroded by saline bodies, are iron and copper; and indeed, unless it be for the single purpose of dissolving fixed alkaline salts, iron vessels seem totally unfit for saline solutions of any kind. Copper vessels are also very liable to be corroded, and to communicate very mischievous qualities to the liquors which corrode them; for which reason, they ought never to be made use of for the purposes of solution. The metal least liable to be corroded, next to gold and silver, is lead; and therefore a chemist ought rather to provide himself with leaden vessels than those of any other metal. But though lead is not apt to be corroded by many kinds of salts, there are some which are found to act upon it, and to form therewith a very dangerous poison. The vegetable acid of vinegar is particularly apt to receive a dangerous impregnation from this metal, and therefore no solution of any salt containing this acid ought to be made in leaden vessels. It appears to be very little affected by the vitriolic or marine acids, and therefore any saline substance containing either of these acids may be safely enough dissolved in vessels made of lead.

In order to save time in making solutions, the vessels ought to be as large as possible; though even in this there must be a certain limit: for two small vessels filled with water will sooner acquire the necessary degree of heat than one large one; and in proportion as the vessel is made more capacious, the sides and bottom must be thicker, which considerably increases the expence. Fifteen or twenty English gallons is the utmost capacity of which they ever will be required; and is rather above what will on most occasions be necessary. They ought to be of a conical figure, round at the bottom; and to have a cover of thick plate-iron all around that part which is exposed to the action of the fire, that the lead may not bend on the application of heat, which it would otherwise be very apt to do. When the solution is to be made, the leaden vessel is first to be filled up with water so far as to have room for the quantity of salt intended to be dissolved:

THEORY.

a fire is then to be applied so as to make it boil: and then the salt is to be added slowly, so as scarcely to hinder the boiling; for if a great quantity was thrown in at once, so as to cool the liquor very much, great part of the salt would concrete on the bottom, in such a manner as not only to be very difficultly soluble, but even to endanger the melting of the vessel. It is of some consequence also to avoid the hot steam which proceeds from the boiling water, and which issues with great force from a narrow-mouthed vessel such as we have been decribing. That the operator may be out of the reach of this, and likewise dissolve the salt in a regular and gradual manner, without any danger of its concreting on the bottom, it will be proper to have a leaden, or even a wooden, vessel, with a long handle; which is to be filled with the substance to be dissolved, then immersed in the boiling liquor, and shaken about in it, till the salt is made into a kind of thick pap, which will be in no danger of concreting. It will also be proper not to saturate the water perfectly with salt; for it will in that case be impossible to hinder part of it from settling on the bottom, where it soon acquires such a degree of heat as to melt the lead. Before any saline substance is put into water for solution, it ought to be pounded and sifted through a hair sieve.

Where large quantities of metal are to be dissolved in acids, especially the nitrous acid, glass vessels are in a manner indispensable; although the common stone-ware bottles, especially those made in Holland, will answer the purpose very well, as not being liable to corrosion, and not so apt to break as the glass vessels are. They may be got of such a size as to hold 3 or 4 gallons: but no vessel in which metalline solutions are made, ought ever to be above half full.

In solutions of oily and inflammable substances, cast iron vessels are perhaps the most proper of any; tho' copper ones are generally preferred. The copper is excessively soluble in oil, especially if it is left to cool in such a vessel; but iron is not soluble in any inflammable matter except sulphur. Copper has however this advantage over iron, that it is sooner cooled, as the vessels made of copper are thinner than they can be made of cast iron: so that if too great heat is applied to a copper vessel, it may be easily remedied by taking it off the fire; but in a cast iron vessel the heat continues so long as may sometimes produce dangerous consequences, even after the fire is removed.

2. FILTRATION. This operation is generally the attendant of solution: very few substances, of the saline kind especially, are capable of being dissolved without leaving some impurities, from which they must be freed; and the doing of this, so as to render the solution perfectly transparent, is what is understood by the word *filtration*.

For purposes merely experimental, a glass funnel and piece of paper are generally sufficient. The paper is formed into a conical cap, which being placed in the funnel with its point downwards, the funnel is then placed in the mouth of a vial; and the solution or other liquor to be filtered is poured into the paper cap, through which the liquor passes transparent, leaving its impurities on the paper. For the purpose of filtration, paper has come into such general use, that a particular

69
Filtration.

kind

THEORY.

THEORY.

kind of it is prepared under the name of *filtering paper*. This is of a reddish colour; but Dr Lewis prefers the whitish grey paper which comes from Holland about the pill boxes, as not giving any colour to the solutions which pass through it.

This operation, though apparently so simple and easy, is nevertheless attended with very troublesome circumstances, on account of the great time it takes up. Even where very small quantities of liquor are to be filtered, merely for experiment's sake, the impurities frequently settle on the paper so soon, and obstruct its pores to such a degree, that the operator is often quite wearied out; often, too, the paper breaks; and thus the whole is spoiled, and the operation must be begun over again.

To avoid these inconveniencies, another method of filtration hath been proposed; namely to use a number of cotton threads, the ends of which are to be immersed in the liquor, and the other ends are to hang over the side of the vessel which contains it, and to hang lower than the surface of the liquor. By this means they will act as so many capillary syphons, (see *SYPHON*); the liquid will arise in them quite pure, and be discharged from their lower extremities into a vessel placed to receive it. That the liquor may flow freely into the cotton, it will be proper to wet the threads before they are used.

In point of efficacy, no doubt, this method excels every other; and where the operator has abundance of time and patience, may be proper for experiments; but, in the way of trade, such a contrivance is evidently useless. For filtering large quantities of liquor, therefore, recourse has been had to large funnels; earthen cullenders, or basins full of holes in the bottom, lined with filtering paper; and to conical bags of flannel or canvas.

The inconveniences attending funnels, when used only in the way of experiment, are much greater when they are employed for filtering large quantities of liquor; and therefore they are generally laid aside. The earthen cullenders, too, do not answer any good purpose; nor indeed does filtration through paper in general succeed well. The conical flannel or canvas bags are greatly preferable; but they have this inconvenience, that the pressure of the liquor is directed chiefly against one particular point, or a small part of the bottom, and therefore the impurities are forcibly driven into that place; and thus the operation becomes insufferably tedious.

The best method of obviating the inconveniences of filtration seems to be the following. Let a wooden frame of about three feet square be made, having four holes, one in each corner, about three quarters of an inch in diameter. This frame is to be supported by four feet, the ends of which must project an inch or two through the holes. Thus the whole may be occasionally let up and taken down, so as to go into very little compass; for if the feet are properly placed, each with a little projection outwards, there will be no danger of its falling. A square piece of canvas must also be procured, somewhat less than the wooden frame. On each corner of it there must be a very strong loop, which slips on one of the projecting ends of the feet, so that the canvas may hang a

little slack in the middle of the frame. The liquor to be filtered is now poured into the canvas, and a vessel placed underneath to receive it. At first it will pass through very foul; but, being returned two or three times, will become perfectly transparent, and will continue to run with great velocity, if the filter is kept constantly full. A filter of the size just now mentioned will contain ten gallons of liquid; which is a very great advantage, as the heat of such a quantity of liquor is not soon dissipated, and every solution filters much faster when hot than when allowed to cool.

The advantages of a filter of this kind above others arise from the pressure of the liquor being more equally diffused over a large space, by which the impurities are not forced so strongly into the cloth as to stop it up entirely. Yet even here, where large quantities of liquor require filtration, the cloth is apt to be stopped up so as to make the operation not a little tedious and disagreeable. It will be proper therefore to have several cloths, that one may be applied as soon as another is taken off.

To promote the operation of filtration, it is very proper to let the liquors to be filtrated settle for some time; that so their grosser feculencies may fall to the bottom, and thus there will be the fewer to retard the last part of the operation. Sometimes, however, these feculencies refuse to settle till after a very long time; and where this happens to be the case, a little powdered quicklime thrown into the boiling liquor remarkably promotes the separation. This, however, can only be used in certain cases.

In some cases, the discovery of a ready way of filtering a large quantity of liquor would be a matter of great consequence; as where a town is supplied with river-water, which is generally far from being clear, and often imparts a disagreeable colour to clothes washed with it. Some years ago, a scheme was proposed by a chemist for filtering muddy water in any quantity. His method was, to have a large cask covered over in the bottom with straw to the depth of some inches, and then filled up with sand. This cask was entirely open at one end, and had a hole in the other, which, by a means of a leaden pipe, communicated with a large reservoir of the water to be filtered, and which stood considerably higher than the cask. The water which descended through the pipe into the cask, having a tendency to rise up to the same level with that in the reservoir, would press violently against the sand, and, as he thought, run over the mouth of the cask perfectly filtrated, and free from its impurities. By this contrivance, indeed, a very violent pressure was occasioned, if the height of the reservoir was considerable; but the consequence was, not a filtration, but a greater of impurity in the water; for the sand was forced out of the cask along with it, and, however confined, the water always rose as muddy as it went in.

Where water is to be filtered in large quantity, as for the purposes of a family, a particular kind of soft spongy stones, called *filtering stones*, are employed. These, however, though the water percolates through them very fine, and in sufficient quantity at first, are liable to be obstructed in the same manner as paper,

THEORY.

THEORY.

and are then rendered useless. A better method seems to be, to have a wooden vessel, lined with lead, three or four feet wide at top, but tapering so as to end in a small orifice at the bottom. The under part of the vessel is to be filled with very rough sand, or gravel, well freed from earth by washing. Over this, pretty fine sand may be laid to the depth of 12 or 14 inches, but which must likewise be well freed from earthy particles. The vessel may then be filled up to the top with water, pouring it gently at first, lest the sand should be too much displaced. It will soon filter thro' the sand, and run out at the lower orifice exceedingly transparent, and likewise in very considerable quantity. When the upper part of the sand begins to be stopped up, so as not to allow a free passage to the water, it may occasionally be taken off, and the earthy matter washed from it, when it will be equally serviceable as before.

71
Precipitation.

3. PRECIPITATION, or COAGULATION. This operation is the reverse of solution, and is the bringing a body suddenly from a fluid to a solid state. It differs from crystallization, in that it generally requires less time, and in crystallization the substance assumes regular figures, whereas precipitates are always in the form of powders.

Precipitation is generally preceded by solution and filtration: it is used for separating earths and metals from the acids which had kept them suspended. When a precipitation is made of the more valuable metals, glass vessels are to be used. When earths, or the imperfect metallic substances, are to be precipitated in large quantity, wooden ones answer every purpose. If a metal is to be precipitated by an alkali, this salt must first be dissolved in water, then filtered, and gradually added to the metallic solution. If particular circumstances do not forbid, the salt for precipitation should be chosen in its caustic state, or deprived of its fixed air, because then a very troublesome effervescence is avoided. To promote the operation also, the mixture, if contained in a glass, is to be shaken; or if in any other vessels, to be well stirred after every addition of alkali. If an earth is employed to precipitate a metal, the mixture must be in a manner constantly stirred or shaken, in order to promote the precipitation; and if one metal is to be precipitated by another, that which is used as a precipitant must be beaten into thin plates, that so they may be frequently cleaned from the precipitating metal, which would otherwise very soon totally impede the operation.

Sometimes a precipitation ensues on the addition of water, or spirit of wine: but, in most cases, care must be taken not to add too much of the substance which is used to precipitate the other; because, in such a case, the precipitate may be dissolved after it has been thrown down. Thus, though volatile alkali will separate copper from aqua fortis, it will as effectually dissolve the precipitate if too much of it is used, as the acid itself. It is proper, therefore, to proceed cautiously, and examine a small quantity of the liquor from time to time. If an addition of the precipitant throws down any more, it will be proper to add some more to the whole solution.

It is seldom or never that precipitation can be performed so perfectly, but that one or other of the in-

72
Educalcation.

redients will prevail; and though they should not, a new compound, consisting of the acid united with the alkali, or other substance used for precipitation, is contained in the liquor through which the precipitate falls. It is proper, therefore, to wash all precipitates; otherwise they can never be obtained perfectly pure, or free from a mixture of saline substances. This is best done by pouring the whole into a filter, and letting the fluid part run off, as long as it will drop, without shaking the cloth. Some water is then to be cautiously poured all over the surface of the precipitate, so as to disturb it as little as possible. This water will push before it the saline liquor which is mixed with the powder, and render it much purer than before. A second, or third quantity of water may be used, in order to wash off all the saline matter. This is called *edulcorating* the precipitate.

4. EVAPORATION. This operation consists in dissipating the moist fluid or volatile parts of any substance by means of heat. It most generally succeeds solution and filtration, being a preparatory for the operation of crystallization.

73
Evaporation.

For the evaporation of saline solutions, which have been already filtered, and which it is of consequence to preserve from even the least impurities, distilling vessels are unquestionably the most proper; both as, by their means, the solution will be kept perfectly free from dust, and as the quantity of liquor evaporated can be known with certainty by measuring that which comes over. This also is probably the most expeditious method of evaporating, and which requires the least fuel. (See the detached articles EVAPORATION and DISTILLATION). With regard to vessels for evaporation, the same thing must be applicable which was mentioned above under *Solution*. No saline liquor must be evaporated in a vessel which would be corroded by it; and hence iron vessels are absolutely improper for evaporations of any kind of saline liquor whatever.—Lead is in this case the metal most generally useful. It must only be used, however, where the evaporation is not carried to dryness; for, on account of the great fusibility of this metal, nothing could be excruciated in it without great danger of its melting. Where a saline liquor therefore is to be perfectly excruciated, the evaporation, if performed in lead vessels, must be carried on so far only as to form a saline pellicle on the surface of the liquor. It is then to be drawn off; for which purpose, all evaporating vessels should have a cock near the bottom. The liquor must now be put into a number of stone-ware basons, set on warm sand, where the excruciation may be finished.

5. CRYSTALLIZATION. This, though commonly accounted one of the processes in chemistry, is in reality only a *natural* one, and which the chemist can only prepare for, leaving the operation entirely in the hands of nature.—By crystallization is meant the separation of a salt from the water in which it has been dissolved, in transparent masses regularly figured, and differently formed, according to the different nature of the salts.

This process depends upon the constitution of the atmosphere more than any other; and therefore is difficult to be performed, nor does it always succeed equally well; neither have there yet been laid down

74
Crystallization.

any

any rules whereby beautiful and regular crystals can with certainty be formed at all times.

As the different facts affume very different figures when crystallized, they are not subject to the same general rules in crystallization. Nitre, Glauber's salt, vitriol of iron, and many others, crystallize best on having their solutions set in a cold place after proper evaporation. Sal polychrest, and common salt, require the solution to be kept as hot as the hand can bear it during the time of crystallizing. Soluble tartar too, and other deliquescent salts, require to be kept warm while this operation is going on; and there are many saline substances, such as the combinations of calcareous earths and magnesia with acids, which can scarcely be crystallized at all.

Mr Beaumé has discovered, that when two or more salts are dissolved in the same quantity of water, when one crystallizes, the crystals of that salt will not contain the least quantity of any of the others; neither, although the liquor was acid or alkaline, will the crystals for that reason be either acid or alkaline, but will remain perfectly neutral; and the acid or alkaline liquor which adheres to the outside of the crystals may be absorbed by merely spreading them on filtering paper.—Hence we are furnished with a better method of shooting salts into large and well formed crystals than merely by dissolving them in water; namely, by adding to the solutions when set to crystallize, a certain quantity of acid or alkaline liquor, according to the nature of the salts themselves. These additions, however, are not equally proper for all salts; and it is not yet determined what kinds of salts ought to be crystallized in alkaline, and what in acid, liquors.—Soluble tartar and Seignette's salt crystallize best when the liquor is alkaline. Sal sedativus, sal Glauberi, and sal polychrest, require an acid if crystallized in the cold; but sal polychrest forms into very fine and large crystals when the solution is alkaline, and kept as hot as the hand can easily bear.

The best general direction that can be given with regard to the regular crystallization of salts is, that they ought to be set to crystallize in as large a quantity at once as possible; and this, as far as we have observed, without any limit; for by this means, the crystals are formed much larger and better figured than they possibly can be by any other method hitherto known.—As to the form of the vessels in which salts are to be crystallized, little can be said with certainty. They are generally flat, and wider at top than at the bottom. The only proper material, in the large way, is lead.

6. DISTILLATION. This is a kind of evaporation; only in such a manner, that the part of the liquor evaporated is not dissipated in the air, but preserved, by making the steam pass through a spiral pipe, which goes through a large vessel full of cold water, or into cold glass receivers.

This is one of the most common chemical operations; and as there are a variety of subjects which require to be distilled, there is consequently a considerable variety both in the form of the distilling vessels to be used on different occasions, and likewise in the materials of which they are made, as well as the management of the fire during the time of the operation.

The most simple and easily performed distillation is that by the common copper still, (fig. 3). It consists of two parts; one called the *body*, and the other the *head*. The body is a cylindrical vessel of copper, which is sometimes tinned over in the inside; but where distillation is performed without any regard to the residuum, the tinning is useless. The upper part of the body terminates in a kind of arch, in the middle of which is a circular aperture, about one half, or something less, in diameter, of the breadth of the whole body.—Into this aperture, a round head, made likewise of copper, is fitted, so as to be removable at pleasure. In the top, or sometimes in the side of the head, is inserted a pewter pipe, which communicates with a spiral one of the same metal, that passes through a large wooden vessel, called the *refrigeratory*, filled with cold water; each of its ends projecting a little above and below. The still is to be filled two thirds full of the substance to be distilled, the head put on, and the junctures well closed with a mixture of lintseed meal and water, or common flour or chalk and water will answer the same purpose. This mixture is called the *lutings*, or *lute*. A fire being kindled under the still, the vapours will arise; and, being condensed by the cold water through which the spiral pipe called the *worm* passes, will run in a stream more or less strong as the fire is more or less hastily urged, and is caught in a receiver set underneath.

This kind of distilling vessels is proper for procuring the essential oils of vegetables, vinous spirits from fermented liquors, and for the rectification of these after they are once distilled. Even the acetous acid may be very conveniently distilled in a copper vessel, provided the worm and all the descending parts of the pipe which communicates with it be of pewter, otherwise a mischievous impregnation of copper would be communicated to the distilled vinegar. The reason of this is, that copper is not dissolved by vinegar, or in very small quantity, when that acid is boiled in it; but if the metal is exposed to the action of the acid when cold, or to its vapours, a considerable dissolution takes place. For this reason, too, the still must be washed out after the operation while it continues hot, and must be very carefully freed from the least remains of acid, otherwise it will be much corroded.

Copper-stills ought to be of as large a size as possible: but Dr Lewis very justly observes, that, in common ones, the width of the worm is by no means proportionable to the capacity of the still; hence the vapour which issues from a large surface being violently forced through a small tube, meets with so much resistance as sometimes to blow off the still-head. This inconvenience is ridiculously endeavoured to be prevented by strongly tying or otherwise forcing down the head; by which means, if the worm should happen to be choked up, a terrible explosion would ensue: for no ligatures, or any other obstacle whatever, have yet been found strong enough to resist the elastic force of steam; and the greater obstacle it has to overcome, the greater would the explosion be.—Dangers of this kind might be totally avoided by having the worm of a proper degree of wideness.

Sometimes, however, matters are to be distilled, as such as mineral acid spirits, which would corrode any kind of vessel.

THEORY.

THEORY.

77
Retort.

kind of metalline vessels; and for these only earth, or the closest kind of stone-ware, can be used. These are more easily condensed than the steams of aqueous or vinous liquors, and therefore do not require to be passed through a pipe of such a length as is used for condensing the steams from the common still. In these cases, where a violent heat is not necessary, and the distillation is to be performed in glass vessels, the retort is used (fig. 4.) When a fluid is to be put into this vessel, the retort must be laid upon its back on sand, or any other soft matter that will support it without breaking. A funnel must also be procured with a long stem, and a little crooked at the extremity, that the liquor may pass at once into the belly of the retort, without touching any part of its neck; otherwise the quantity which adhered to the neck would pass into the receiver when the retort was placed in a proper situation for distilling, and foul the produce. When the vessel is properly filled, which ought never to be above two thirds, it is to be set in a sand bath; that is, in an iron pot, of a proper thickness, and covered over in the bottom, to the depth of one or two inches, with dry sand. When the retort is put in, so as to stand on its bottom, the pot is to be filled up with sand, as far as the neck of the retort. A glass receiver is then to be applied, which ought to be as large as possible, and likewise pretty strong, for which reason it will be proper not to let the capacity of it be above what is necessary to hold ten gallons. In the hinder part of it should be drilled a small hole, which may be occasionally shut by a small wooden peg. The mouth of the receiver ought to be so wide as to let the nose of the retort enter to the middle of it, or very near it; for if the vapours are discharged very near the luting, they will act upon it much more strongly than when at a distance. It is likewise proper to have the neck of the retort as wide as may be; for this has a very great effect in the condensation, by presenting a larger surface to the condensing vapour.

78
Luting for acid spirits.

The luting for acid spirits ought to be very different from that used in other distillations; for these will penetrate the common lutes so as to make them liquid and fall down into the receiver. Some have used retorts, the necks of which were ground to the receivers with emery; but these are very difficult to be procured, and are expensive, and consequently have never come into general use. Various kinds of lutes have been proposed, but the preference seems due to a mixture of clay and sand. We are not to understand, however, that every kind of clay is fit for this purpose: it must only be such as is not at all, or very little, affected by acids; and this quality is only possessed by that kind of which tobacco-pipes is made. Trial ought to be made of this before the distillation is begun, by pouring a little nitrous acid on the clay intended to be made use of. If a violent effervescence is raised, we may be sure that the clay is unfit for the purpose. Finely powdered alabaster would answer extremely well, had it the ductility of clay. As this kind of lute remains soft for a considerable time, it ought to be farther secured by a bit of rag spread with some strong cement, such as quicklime mixed with the white of an egg, &c. Matters, however, ought

to be managed in such a manner, that the luting may give way, rather than the vessels burst; which would not only occasion a certain loss of the materials, but might endanger the persons who were standing by.

The iron pots commonly used for distillations by the sand-bath, or *balneum arenae*, are commonly made very thick; and are to be sold at large foundries, under the name of *sand-pots*. The shape of these, however, is by no means eligible: for, as they are of a figure nearly cylindrical, if the retort is of such a size as almost to fill their cavity, it cannot be put into them when full, and often pretty heavy, without great danger of touching the sides of the pot; and in this case, touching and breaking are synonymous expressions. It is much better, therefore, to have them in the figure of a punch-bowl; and the common cast-iron kettles, which may be had much cheaper than the sand-pots usually sold, answer extremely well. If the distilling vessel is placed in a pot filled with water, the distillation is said to be performed in a water-bath, or *balneum marie*.

When the matter to be condensed is very volatile, a number of open receivers with two necks, called *adopters*, (fig. 7.) may be used, with a close receiver at the end. Each of these adopters must be luted with as much care as when only a single receiver is made use of. Vessels of a similar kind were formerly much used by chemists for particular sublimations, under the name of *aludels*.

80
Adopters or aludels.

Formerly, instead of retorts, a vessel called a *cucurbit*, (fig. 5, and 6.) with a head like the common still, called an *alembic*, were used; but the more simple figure of the retort gives it greatly the preference. It is but seldom that vessels of this kind are useful, which will be taken notice of when describing the particular operations; and if at any time an alembic head should be necessary, its use may be superseded by a crooked glass tube, which will answer the purpose equally well.

Sometimes a very violent fire is required in distillations by the retort. Here, where it is possible, glass or earthen vessels should be avoided, and iron pots substituted in their stead. The hardest and best cast iron, however, will at last melt by a vehement heat; and therefore there is a necessity for using earthen ware, or coated glass. This last is better than most kinds of earthen ware, as being less porous; for when the vessel is urged by a very intense heat, the glass melts, and forms a kind of semivitreous compound with the inside of the coating, so that its figure is still preserved, and the accidental cracks in the luting are filled up.

For coating of glasses, mixtures of colcothar of vitriol, sand, iron filings, blood, chopped hair, &c. have been recommended. We cannot help thinking, however, that the simple mixture of tobacco-pipe clay and sand is preferable to any other; especially if, as Dr Black directs, that part next the glass is mixed with charcoal dust.

The proportions recommended by the Doctor for luting the joints of vessels, are, four parts of sand, and one of clay; but, for lining the insides of furnaces, and, we should think, likewise for coating glass vessels, he directs 6 or 7 of sand to 1 of clay; that the contraction

81
Coating of glasses.

THEORY.

tion of the clay in drying may thereby be the more effectually prevented. Besides this, he directs a mixture of three parts of charcoal-dust with one of clay, to be put next the furnace itself, as being more apt to confine the heat; but possibly the first composition might be sufficient for glasses.

The coating of large glasses must be a very troublesome and tedious operation; and, therefore, coated glass is never used but in experiments. When large distillations must be performed in the way of trade, recourse must be had either to iron pots, or to earthen ware. Of the most proper kinds of earthen ware for resisting violent heats, we shall take notice under the article *Fusion*.

In all distillations by the retort, a considerable quantity of air, or other incondensable vapour, is extricated; and to this it is absolutely necessary to give vent, or the vessels would be burst, or the receiver thrown off. For this purpose, Dr Lewis recommends an open pipe to be inserted at the luting, of such an height as will not allow any of the vapour to escape; but this we cannot approve of, as by that means a constant communication is formed between the external atmosphere, and the matters contained in the retort and receiver, which is at all times to be avoided as much as possible, and in some cases, as the distillation of phosphorus, would be very dangerous. The having a small hole drilled in the receiver, which is to be now and then opened, must answer the purpose much better, although it takes more attendance; but if the operator is obliged to leave the vessels for some time, it will be convenient either to leave the little hole open, or to contrive it so that the wooden peg may be pushed out with less force than is sufficient to break the lute.

7. **SUBLIMATION.** This, properly speaking, is only the distillation of a dry substance; and therefore, when volatile matters, such as salt of hartshorn, are to be sublimed, the operation is performed in a glass retort set in a sand bath, and the salt passes over into the receiver. The cucurbit and alembic were formerly much in use for this purpose; and a blind head, without any spout, was applied. A much simpler apparatus, however, is now made use of. A globe made of very thin glass, or an oblong vessel of the same kind, answers the more common purposes of sublimation. For experiments, Florence flasks are excellent; as being both very cheap, and having the necessary shape and thinnels requisite for bearing the heat without cracking. The matter to be sublimed must not, on almost any occasion, take up more than a third part of the subliming vessel. It is to be set in a sand-bath, that the heat may be more equally applied than it could otherwise be. The heat must be no greater, or very little, than is necessary for sublimation, or it will be in danger of flying out at the mouth of the subliming vessel, or of choking it up so as to burst. The upper part of the vessel, too, must by no means be kept cool, but slightly covered with sand, that the matter may settle in a kind of half-melted state, and will thus form a compact, hard cake, which is the appearance sublimates are expected to have. Hence this operation requires a good deal of caution, and is not very easily performed.

THEORY.

83
Deflagration.

8. **DEFLAGRATION.** This operation is always performed by means of nitre, except in making the flowers of zinc. It requires open vessels of earth, or iron; the latter are very apt to be corroded, and the former to imbibe part of the matter. To perform this process with safety, and without loss, the nitre ought to be mixed with whatever matter is to be deflagrated with it, and thrown by little and little into the vessel previously made red-hot. If much is put in at once, a great deal will be thrown out by the violent commotion; and to perform this operation in close vessels is in a manner impossible, from the prodigious quantity of elastic vapour generated by the nitre. Care must also be taken to remove the whole mixture to some distance from the fire, and not to bring back any spark from the quantity deflagrating, with the spoon which puts it in; otherwise the whole would irremediably be consumed at once.

9. **CALCINATION.** This is the subjecting any matter to a heat so violent, as to dissipate some part of it, without melting what remains. It is often practised on metallic substances, particularly lead, for obtaining the calx of that metal called *minium*, or red lead.

This operation, as indeed all other chemical ones, is best performed in large quantities, where a particular furnace is constructed on purpose, and a fire kept on day and night without interruption. The flame is made to play over the surface of the metal, and it is continually stirred so as to expose different parcels of it to the action of the heat.

10. **FUSION.** This is when a solid body is exposed to such a degree of heat as makes it pass from a solid to a fluid state; and as different substances are possessed of very different degrees of fusibility, the degrees of melting heat are very various.

Besides the true fusion, there are some kinds of salts which retain to large a proportion of water in their crystals, as to become entirely fluid upon being exposed to a very small degree of heat. This is commonly called the *watery fusion*; but is really a *solution* of the salt in that quantity of water retained by it in its crystalline form: for such salts afterwards become solid by the evaporation of the water they contained; and then require a strong red heat to melt them thoroughly, or perhaps are absolutely unfusible.

Of all known substances, unctuous and inflammable ones become fluid with the least heat; then come the more fusible metals, lead, tin, and antimony; then some of the more fusible salts; and then the harder metals, silver, gold, copper, and iron; then the mixtures for making glass; and last of all, the metal called *platina*, which has hitherto been incapable of fusion, except by the violent action of the sun-beams in the focus of a large burning glass. This substance seems to be the most refractory of all others, even the hardest flints melting into glass long before it. (See **PLATINA**.)

Fusion of small quantities of matter is usually performed in pots called *crucibles*; which, as they are required to stand a very violent heat, must be made of the most refractory materials possible.

The making of crucibles belongs properly to the crucible, potter; but as a *chemist* ought to be the judge of their composition, we shall here give some account of the different

84

Sublimation.

THEORY.

different attempts to make these vessels of the necessary strength.

All earthen vessels are composed, at least partly, of that kind which is called the *argillaceous earth* or *clay*, because these only have the necessary ductility, and can be formed into vessels of the proper form. Pure clay is, by itself, absolutely unfusible; but is exceedingly apt to crack when exposed to sudden changes of heat and cold. It is also very apt to melt when mixed with other substances, such as calcareous earths, &c. When mixed in a certain proportion with other materials, they are changed by violent heat into a kind of half-melted substance, such as our stone-bottles. They cannot be melted completely, however, by almost any fire; they are also very compact, and will contain the most fusible substances, even glass of lead itself; but as they are very apt to crack from sudden changes of heat and cold, they are not so much used; yet, on particular occasions, they are the only ones which can be made use of.

The more dense any kind of vessels are, the more apt they are, in general, to break, by a sudden application of heat, or cold: hence crucibles are not, in general, made of the greatest density possible; which is not at all times required. Those made at Hesse, in Germany, have had the best reputation for a long time. Mr Pott, member of the academy of sciences at Berlin, hath determined the composition of these crucibles to be, one part of good refractory clay, mixed with two parts of sand, of a middling fineness, from which the finest part has been sifted. By sifting the finer particles from the sand, too great compactness is avoided: but at the same time this mixture renders them apt to be corroded by vitrifying matters kept a long time in fusion; for these do not fail to act upon the sand contained in the composition of the crucible, and, forming a vitreous mass, at last run through it.

This inconvenience is prevented, by mixing, instead of sand, a good baked clay in gross powder. Of a composition of this kind are made the glass-house pots, which sometimes sustain the violent heat employed in making glass, for several months. They are, however, gradually consumed by the glass, and become constantly more and more thin.

As the containing vessel, however, must always be exposed to a more violent heat than what is contained in it, crucibles ought to be formed of such materials as are not vitrifiable by any heat whatever. But, from the attempts made to melt platina, it appears, that of all known substances it would be the most desirable for a melting-vessel. Hessian crucibles, glass-house pots, Sturbridge-clay, in short every substance which could be thought of to resist the most violent heat, were melted in such a manner as even to stop up the pipes of large bellows, while platina was not altered in the least; and Messrs Macquer and Beaumé have shewn, that though platina cannot be melted so as to cast vessels of it, it may nevertheless be cupelled with lead so as to become malleable, and thus vessels might otherwise be made from that substance.

The extreme scarcity of this mineral, however, leaves no room to hope any thing from it; and Mr Pott has made so many experiments upon clays mixed with different substances, that he has in a manner ex-

hausted the subject. The basis of all his compositions was clay. This he mixed in different proportions with metallic calces, calcined bones, calcareous earths, talcs, amianthus, albestus, pumice-stones, tripoli, and many others; but he did not obtain a perfect composition from any of them. The best crucibles, according to Scheffer, cannot easily contain metals dissolved by sulphur, in the operation of parting by means of sulphur. They may be made much more durable and solid, by steeping them a few days in linseed-oil, and strewing powdered borax upon them before they are dried.

The results of Mr Pott's experiments are. 1. Crucibles made of fat clays are more apt to crack when exposed to sudden heat, than those which are made of lean or meagre clays. *Meagre clays* are those which contain a considerable quantity of sand along with the pure argillaceous earth; and *fat clays* are those which contain but little. 2. Some crucibles become porous by long exposure to the fire, and imbibe part of the contained metals. This may be prevented, by glazing the internal and external surfaces; which is done, by moistening these with oil of tartar, or by strewing upon them, when wetted with water, powdered glass of borax. These glazings are not capable of containing glass of lead. 3. Crucibles made of burnt clay grossly powdered, together with unburnt clay, were much less liable to crack by heat than crucibles made of the same materials where the burnt clay was finely powdered, or than crucibles made entirely of unburnt clay. 4. If the quantity of unburnt clay be too great, the crucible will be apt to crack in the fire. Crucibles made of 10 ounces of unburnt clay, 10 ounces of grossly powdered burnt clay, and three drachms of calcined vitriol, are capable of retaining melted metals, but are pervaded by glass of lead. The following composition is better than the preceding: Seven ounces of unburnt clay, 14 ounces of grossly powdered burnt clay, and one drachm of calx of vitriol. These crucibles may be rendered more capable of containing glass of lead, by lining their internal surfaces, before they are baked, with unburnt clay diluted with water. They may be further strengthened by making them thicker than is usually done; or by covering their external surfaces with some unburnt clay, which is called *arming* them.

5. The composition of crucibles most capable of containing the glass of lead, was 18 parts of grossly powdered burnt clay, as much unburnt clay, and one part of fusible spar. These crucibles must not, however, be exposed too suddenly to a violent heat. 6. Crucibles capable of containing glass of lead very well, were made of 24 parts of unburnt clay, four parts of burnt clay, and one part of chalk. These require to be armed. 7. Plume alum powdered, and mixed with whites of eggs and water, being applied to the internal surface of a Hessian crucible, enabled it to retain for a long time glass of lead in fusion. 8. One part of clay, and two parts of Spanish chalk, made very good crucibles. The substance called Spanish chalk is not a calcareous earth, but appears to be a kind of steatites. 9. Two parts of Spanish chalk, and one part of powdered tobacco-pipes, made good lining for common crucibles. 10. Eight parts of Spanish chalk, as much burnt clay, and one part of litharge, made solid crucibles

bles. 17. Crucibles made of black lead are fitter than Hessian crucibles for melting metals; but they are so porous, that fused salts pass entirely through them. They are more tenacious than Hessian crucibles, are not so apt to burst in pieces, and are more durable. 12. Crucibles placed with their bottoms upwards, are less apt to be cracked during the baking, than when placed differently. 13. The paste of which crucibles are made, ought not to be too moist; else, when dried and baked, they will not be sufficiently compact: hence they ought not to be so moist as to be capable of being turned on a potter's lathe; but they must be formed in brass or wooden moulds.

On this subject Dr Lewis hath made several observations, the principal of which are, 1. Pure clay softened to a due consistence for being worked, not only coheres together, but sticks to the hands. In drying, it contracts 1 inch or more in 12; and hence it is very apt to crack, unless it is dried exceeding slowly. In burning, it is subject to the same inconvenience, unless very slowly and gradually heated. When thoroughly burnt, if it has escaped those imperfections, it proves solid and compact; and so hard as to strike fire with steel. Vessels made of it are not penetrated by any kind of liquid; and resist salts and glasses brought into the thinnest fusion, excepting those which by degrees corrode and dissolve the earth itself, as glass of lead; and even this penetrating glass, is resisted by it better than by almost any other earth; but, in counterbalance to these good qualities, they cannot be heated or cooled, but with such precautions as can rarely be complied with in the way of business, without cracking, or flying in pieces.

2. Clay that has been once exposed to any considerable degrees of heat, and then powdered, has no longer any tenacity. Fresh clay, divided by a due proportion of this powder, proves less tenacious than by itself; not sticking to the hands, though cohering sufficiently together. It shrinks less in drying, is less apt to crack, and less susceptible of injury from alterations of heat and cold; but at the same time is less solid and compact. Considerable differences are observed in these respects; not only according to the quantity of dividing matter, but according as it is in finer or coarser powder.

3. Vessels made with a moderate proportion of fine powder, as half the weight of the clay, are compact and solid, but still very apt to crack, from sudden heat or cold: those with a larger proportion, as twice or thrice the quantity of the clay, are free from that imperfection, but so friable as to crumble between the fingers. Nor does there appear to be any medium between a disposition to crack, and to crumble; all the compounds made of clay and fine powders having the one or the other, or both imperfections. Coarser powders of the size of middling sand, form, with an equal weight of clay, compounds sufficiently solid, and much less apt to crack than the mixtures with fine powders. Two parts of coarse powder, and one of clay, prove moderately solid, and but little disposed to crack: a mixture of three parts and one, though heated and cooled suddenly, does not crack at all, but suffers very fluid substances to transude through it; solidity, and resistance to quick vicissitudes

tudes of heat and cold, seeming here also to be incompatible.

4. Pure clay, mixed with pure clay that has been burnt, is no other than one simple earth; and is neither to be melted, nor softened, nor made in any degree transparent, with the most intense fires.

5. Mixtures of clay with gypseous earths burn whiter than clay alone; in certain proportions, as two parts of clay to three of gypsum, they become, in a moderate fire, semi-transparent, and in a strong one they melt.

6. Calcareous earths in small proportion bake tolerably compact and white; and added to other compositions, seem to improve their compactness. If the quantity of the calcareous earth nearly equals that of the clay, the mixture melts into a yellow glass; if it considerably exceeds, the product acquires the qualities of quicklime.

7. Vessels made from clay and sand, in whatever proportion, do not melt in the strongest fire; but they sometimes bend or soften, so as to yield to the tongs. Glasses in thin fusion penetrate them by dissolving the sand. If gypseous or calcareous earths are urged in such crucibles with a vehement heat, the vessels and their contents run all into one mass. In moderate fires, these vessels prove tolerably compact, and retain most kinds of salts in fusion: but they are liable to crack, especially when large; and do not long sustain melted metals, being burst by their weight. Such are the Hessian crucibles.

8. Mixtures of clay and black-lead, which seems a species of talc, are not liable to crack from alternations of heat and cold; but are extremely porous. Hence black-lead crucibles answer excellently for the melting of metals, and stand repeated fusions; whilst salts flowing thin, transude through them almost as water through a sieve: sulphureous bodies, as antimony, corrode them.

9. Pure clay, softened with water, and incrustated on earthen vessels that have been burnt, does not adhere to them, or scales off again upon exposure to the fire; applied to unburnt vessels, it adheres and incorporates. Divided clay unites with them in both states. Vitreous matters, melted in vessels of pure clay, adhere so firmly as not to be separated; from vessels of divided clay they may be knocked off by a hammer.

10. The saline fluxes which promote the fusion of clay, besides the common ones of all earths, alkali and borax, are chiefly arsenic fixed by nitre, and the fusible salt of urine, both which have little effect on the other earths though mixed in a large proportion. Nitre which readily brings the crystalline earths into fusion, and sal mirabile and sandiver, powerful fluxes for the calcareous earths, do not perfectly vitrify with clay. Burnt clay does not differ in these respects from such as has not been burnt; nor in that singular property of vitrifying with gypseous or calcareous earths, without any saline or metallic addition; the utmost vehemence of fire seeming to destroy only its ductility, or that power by which it coheres when its parts are moistened with water.

But, though it seems impossible to make perfect vessels from mixtures of clay in its two different states,

THEORY.

91
More perfect vessels to be hoped for from porcelain.

of burnt and unburnt, more is to be hoped from the mixtures which are employed in making porcelain. Manufactories of this kind of ware have been attempted in different countries, (see PORCELAIN); and in some places the qualities requisite for chemical vessels have been given to it in a very surprising degree. The count de Lauraguais, a French nobleman, and member of the academy of sciences, has distinguished himself in a very eminent manner by attempts of this kind. The translator of the chemical dictionary assures us, that he had it from a gentleman of undoubted veracity, that this nobleman having heated a piece of his porcelain red hot, threw it into cold water, without breaking or cracking it.

92
Mr Reaumur's porcelain.

The most useful attempt, however, for the purposes of chemistry, seems to be the discovery by Mr Reaumur of converting common green glass into porcelain. This was published so long ago as the year 1739; yet we have not heard of any chemist, no not Dr Lewis himself, who has made trial of chemical vessels formed of this sort of porcelain, although the very use to which Mr Reaumur thought this preparation could be applicable was that of bringing chemical vessels to a degree of perfection which could not otherwise be done. The following is the result of Mr Reaumur's experiments.

Green glass, surrounded with white earthy matters, as white sand, gypsum, or plaster of Paris, &c. and exposed to a considerable heat not strong enough to alter its figure, as that of a potter's furnace, acquires different shades of blue, and by degrees begins to grow white. On breaking the glass, the white coat appears to be composed of fine, white, glossy, satin-like fibres, running transversely, and parallel to one another; the glass in the middle being scarcely altered. On continuing the cementation, the change proceeds further and further, till at length the white fibrous parts from both sides meet in the middle, and no appearance of glass remains. By this means, entire vessels of glass may be changed into porcelain.

The substance into which glass is thus converted, is opaque, compact; internally of great whiteness, equal to that of the finest china-ware; but, externally, of a much duller hue. It is considerably harder than glass, much less fusible in the fire, and sustains alterations of heat and cold without injury. Vessels of it, cold, bear boiling liquors; and may be placed on the fire at once, without danger of their cracking. "I have put a vessel of this porcelain (says the author) into a forge, surrounded it with coals, and kept vehemently blowing for near a quarter of an hour; I have melted glass in this vessel, without its having suffered any injury in its figure." If means could be found of giving the outside a whiteness equal to the internal part, glass vessels might thus be converted into a valuable kind of porcelain, superior to all that have hitherto been made. Chersiftry, says he, may receive from this discovery, in its present state, such vessels as have been long wanted; vessels which, with the compactness and impenetrability of glass, are also free from its inconveniences.

The common green glass bottles yield a porcelain of tolerable beauty; window-glasses, and drinking-glasses, a much inferior one; while the finer kinds

of crystalline glasses afforded none at all. With regard to the cementing materials, he found white sand and gypsum, or rather a mixture of both, to answer best. Coloured earths generally make the external surface of a deeper or lighter brown colour; foot and charcoal, of a deep black, the internal part being always white.

The account of this kind of porcelain given by Mr Reaumur, induced Dr Lewis, who had also observed the same changes on the bottom of glass-retorts exposed to violent heat in a sand-bath, to make further experiments on this matter, an account of which he has published in his *Philosophical Commerce of Arts*. The results of his experiments were, 1. Green glass, cemented with white sand, received no change in a heat below ignition. 2. In a low red heat, the change proceeded exceeding slowly; and in a strong red heat, approaching to white, the thickest pieces of glass bottles were thoroughly converted in the space of three hours. 3. By continued heat, the glass suffered the following progressive changes: first, its surface became blue, its transparency was diminished, and a yellowish hue was observable when it was held between the eye and the light. Afterwards it was changed a little way on both sides into a white substance, externally still bluish; and, as this change advanced still further and further within the glass, the colour of the vitreous part in the middle approached nearer to yellow: the white coat was of a fine fibrous texture, and the fibres were disposed nearly parallel to one another, and transverse to the thickness of the piece: by degrees the glass became white and fibrous throughout, the external bluishness at the same time going off, and being succeeded by a dull whitish or dun colour. By a still longer continuance in the fire, the fibres were changed gradually from the external to the internal part, and converted into grains; and the texture was then not unlike that of common porcelain. The grains, at first fine and somewhat glossy, became by degrees larger and duller; and at last the substance of the glass became porous and friable, like a mass of white sand slightly cohering. 4. Concerning the qualities of this kind of porcelain, Dr Lewis observes, that, while it remained in the fibrous state, it was harder than common glass, and more able to resist the changes of heat and cold than glass, or even porcelain; but, in a moderate white heat, was fusible into a substance not fibrous, but vitreous and smooth, like white enamel: that when its texture had become coarsely granulated, it was now much softer and unfusible; and lastly, that when some coarsely granulated unfusible pieces, which, with the continuance of a moderate heat, would have become porous and friable, were suddenly exposed to an intense fire, they were rendered remarkably more compact than before; the solidity of some of them being superior to that of any other ware.

It seems surprising that this able chemist, who, on other occasions, has the improvements of the arts so much at heart, did not put some vessels of this kind of porcelain to other severe trials, besides attempting to fuse it by itself with a violent fire: for though pieces of it were absolutely unfusible, we are not sure but they might have been corroded by alkaline salts, acids,

THEORY.

93

94

This substance is so imperfect.

THEORY.

THEORY.

acids, calcareous earths, or glafs of lead; nay, it fhould feem very probable that they would have been fo, in which cafe they would not be much fuperior to the veffels made from earthy materials. When a firft-rate chemift publifhes any thing in an imperfect ftate, inferior ones are difcouraged from attempting to finifh what he has begun; and thus, notwithstanding that thefe experiments have been fo long publifhed, nobody has yet attempted to inveftigate the properties of this kind of porcelain, by getting chemical veffels made of it, and trying how they anſwer for crucibles, or retorts.

All that has been faid concerning the proper materials for crucibles, muft likewife be applicable to the materials for retorts, which are required to ftand a very violent heat. Mr Reaumur's porcelain bids faireft for anſwering the purpoſe of retorts, as well as crucibles. The great difadvantage of the common earthen ones, is, that they fufter a quantity of volatile and penetrating vapours to paſs through them. This is very obſervable in the diſtillation of phosphorus; and though this ſubſtance has not hitherto been uſed for any purpoſe in medicine, and very little in the arts, its acid only being ſometimes uſed as a flux, if vefſels could be made capable of confining all the ſteam, and at the ſame time bearing the heat neceſſary for its diſtillation, phosphorus, perhaps, might be obtained in ſuch quantity, as to ſhew that it is a preparation not altogether ufeleſs.

95
Stone-ware
veſſels cor-
roded.

With regard to ſtone-ware vefſels, and all thoſe in which the compoſition of ſand or flint enters, we ſhall only further obſerve, that they will be corroded by fixed alkaline ſalts, eſpecially of the cauſtic kind, in a very moderate heat. Dr Black, having evaporated ſome cauſtic ley in a ſtone-ware baſon, and then melted the dry ſalt in the ſame veſſel, found it fo corroded, as afterwards to be full of ſmall holes; and he found nothing to reſiſt the action of this ſalt ſo well as ſilver.

96
Maceration.

11. MACERATION, OR DIGESTION. This is the mixing two bodies, generally a ſolid and a fluid, together, and then expoſing them to a moderate degree of heat for a conſiderable length of time, that ſo they may have the better opportunity of acting upon one another. Diſteſtion is uſually performed in the glaſſes already mentioned, called *matraſſes* or *bolt-heads*; and is done in a ſand heat. When any of the ſubſtances are very volatile, as ſpirit of wine, or the matter requires to be heated ſo conſiderably that a quantity of vapour will be raiſed, the necks of the bolt-heads ought to be pretty long; or a tin pipe may be interſed, of ſufficient length to prevent the eſcape of any part of the ſteam.

97
Levigation.

12. LEVIGATION. This is the reducing any body to a very fine powder, which ſhall feel quite ſoft between the fingers or when put into the mouth. It is performed by grinding the ſubſtance upon a flat marble ſtone, with ſome water, or by rubbing it in a marble mortar. In the large way, levigation is performed by mills drawn by horſes, or driven by water; ſome of them are ſo ſmall as to be turned by the hand. They conſiſt of two ſmooth ſtones, generally of black marble, or ſome other ſtone equally hard, having ſeveral grooves in each, but made to run in contrary di-

rections to one another when the mill is ſet in motion. The matter being mixed with water, is put in by a funnel, which is fixed into a hole in the upper ſtone, and turns along with it. The under millſtone has round it a wooden ledge, whereby the levigating matter is confined for ſome time, and at length diſcharged, by an opening made for that purpoſe, when it has accumulated in a certain quantity.

In this operation, when the matters to be levigated are very hard, they wear off a part of the mortar, or ſtones on which they are levigated; ſo that a ſubſtance perfectly hard, and which could not be worn by any attrition, is as great a deſideratum for the purpoſes of levigation, as one which could not be melted is for thoſe of fuſion. Dr Lewis propoſes the porcelain of Mr Reaumur as an improvement for levigating planes, mortars, &c. becauſe, while in its fibrous ſtate, it is conſiderably harder than glaſs, and conſequently much leſs liable to abraſion by the harder powders.

In many caſes levigation is very much accelerated by what is called *elutriation*. This is the method by which many of the painters colours are prepared of the requiſite fineneſs; and is performed by mixing any ſubſtance, not totally reduced to the neceſſary degree of fineneſs, with a ſufficient quantity of water, and ſtirring them well together. The finer parts of the powder remain ſome time ſuſpended in the water, while the groſſer particles fall to the bottom. The ſeparation is then eaſily made, by pouring off the water impregnated with theſe fine parts, and committing the reſt to the levigating mill, when it may again be waſhed; and this may be repeated till all the powder is reduced to the utmoſt fineneſs. Subſtances ſoluble in water cannot be levigated in this manner.

Of Chemical Furnaces.

THE two general diviſions we have already mentioned of thoſe who praſtice chemistry, namely, thoſe who have no other view than mere experiment, and thoſe who wiſh to profit by it, render very different kinds of furnaces neceſſary. For the firſt, thoſe furnaces are neceſſary which are capable of acting upon a ſmall quantity of matter, yet ſufficient for all the changes which fire can produce, from ſimple diſteſtion, to the moſt perfect vitrification. For the others, thoſe are to be choſen which can produce the ſame changes upon very large quantities of matter, that as much may be done at once as poſſible.

To avoid the trouble and expence of a number of portable furnaces, a portable one hath long been a deſideratum among thoſe chemiſts who are fond of making experiments. One of the beſt of thoſe, if not the very beſt, that hath yet appeared, is that deſcribed in Shaw's edition of Boerhaave's chemistry, and repreſented fig. 1.

This furnace is made of earth; and, as the workmanſhip of a furnace requires none of the neatneſs or elegance which is required in making potters vefſels, any perſon may eaſily make a furnace of this kind for himſelf, who has time and patience for ſo doing. With regard to the moſt proper materials, all that we have ſaid concerning crucibles and retorts muſt be appli-

THEORY.

THEORY.

cable to the materials for constructing a furnace; only here we need not care so much for the porosity, or disposition to crumble, as when crucibles or other distilling vessels are to be made.

Plate-iron is commonly directed for the outside of portable furnaces; but we cannot help thinking this is a very needless expence, seeing the coating which it necessarily requires on the inside may be supposed to harden to such a degree as soon to support itself, without any assistance from the plate-iron. This will be the less necessary, if we consider, that, for the thickness of the walls of any furnace where a considerable heat is wanted, two or three inches are by no means sufficient. When the inside of a furnace is heated, the walls, if very thin, are soon penetrated by the heat, and great part of it by this means dissipated in the air. If they are of a sufficient thickness, the heat cannot penetrate so easily; and thus the inner part of the furnace preserves the heat of the fuel, and communicates it to the contained vessel. In the construction of a portable furnace, therefore, it will be convenient to have all parts of it six inches thick at least. This will also give it a sufficient degree of strength; and, as it is formed of several different pieces, no inconvenience can follow from the weight of each of them taken separately.

In Boerhaave's chemistry, this furnace is represented as narrower at bottom than at the top; but we cannot suppose any good reason for such a form, seeing a cylindrical one behaved to answer every purpose much better, as allowing a larger quantity of air to pass through the fuel, and likewise not being so apt to be overturned as it necessarily must be where the upper part is considerably heavier than the lower. We have, therefore, given a representation of it as of a cylindrical form.

The furnace consists of five, or more parts. C, represents the dome, or top of the furnace, with a short earthen funnel E for transmitting the smoke. B, B, B, are moveable cylinders of earth, each provided with a door D, D, D. In Boerhaave's chemistry these doors are represented as having iron hinges and latches; but they may be formed to more advantage of square pieces of earth, having two holes in the middle, by which they may be occasionally taken out, by introducing an iron fork. In like manner, the domes and cylinders, in Boerhaave's chemistry, are represented with iron handles; but they may be almost as easily taken off by the cheaper contrivance of having four holes in each, two directly opposite to one another, into which two short forks may be introduced when the parts are to be separated.

In the lowermost cylinder is to be placed an iron-grate, a little below the door, for supporting the fire. In the under part is a small hole, big enough for introducing the pipe of a pair of good perpetual bellows, when the fire is to be violently excited. Dr Lewis prefers the organ-bellows to any other kind.

When the bellows is used, the whole must stand upon a close cylinder A, that the air may be confined, and made to pass through the fuel. By having more bellowses, the fire may be excited to a most intense degree. In this case, the pipe of every one of them

must enter the cylinder B.

Each of the cylinders should have, in its upper part, a round hole, opposite to its door, for carrying off the smoke, by means of a pipe inserted into it, when the furnace is used for distillations by the sand-bath. Each cylinder ought likewise to have a semicircular cut in the opposite sides, both above and below, that when the under cut of the upper cylinder is brought directly above the upper cut of the lower one, a perfect circle may be formed. These are for giving a passage to the necks of retorts, when distillation by the retort is to be performed. The holes may be occasionally filled with stopples made of the same materials with the body of the furnace.

The most convenient situation for a furnace of this kind would be under a chimney; the vent of which might be easily stopped up by a broad plate of iron, in which a hole ought to be cut for the reception of the earthen tube of the dome. By this means the use of a long tube, which at any rate must be very troublesome, might be easily avoided, and a very strong blast of air would pass through the fuel. If it is found convenient to place the furnace at some distance from the chimney, a plate-iron pipe, must be procured to fit the earthen pipe of the dome, and carry the smoke into the chimney. This pipe will also be of use, when the furnace is used for distillations by the sand-bath; it must then be inserted into the hole opposite to the door of any of the cylinders, and will convey away the smoke, while the mouth of the cylinder is totally covered with a sand-pot.

For portable furnaces, Dr Lewis greatly recommends the large black crucibles, marked n° 60, 'on account of their resisting a violent heat, and being very easily cut by a knife or saw, so that doors, &c. may be formed in them at pleasure. The bottom of one of these large ones being cut out, a grate is to be put into the narrow part of it. For grates, the doctor recommends cast-iron rings, having each three knobs around them. These knobs go into corresponding cavities of the outer rings, and the knobs of the outermost rest on the crucible, which is to be indented a little to receive them, that so the grate may rest the more firmly, and the furnace not be endangered from the swelling of the iron by heat. When this is to be made use of as a melting-furnace, and a violent heat to be excited, another crucible must be inverted on that which contains the fuel, which serves instead of the dome of the last mentioned furnace: and as whatever is said of it must likewise be applicable to the two crucibles when placed above one another, we need give no farther description of the doctor's portable furnace.

No doubt, the great experience of Dr Lewis in chemical matters must give very considerable weight to any thing he advances; and the warmth with which he recommends these furnaces must convince us, that he has found them abundantly answer the purposes of experiments. We cannot help thinking, however, that where a very great and lasting heat is to be given, the thinness, and even the form, of these crucibles, is some objection to their use. It is certain that such a permanent, or, as the workmen call it, a *solid* heat, can never be given where the walls of a furnace are thin,

99
Dr Lewis's portable furnaces.

100
Objection to their use in some cases.

THEORY.

THEORY.

thin, as when they are of sufficient thickness. They are also very apt to burst with great heat; and, for this reason, Dr Lewis desires his furnace to be strengthened with copper hoops. This disposition to burst proceeds from the inner parts, which are more intensely heated than the outer, expanding more than these do, and consequently bursting them. Hence the doctor desires his furnace to be strengthened also by putting it within another crucible of a larger size, and the intermediate space to be filled up with a mixture of sifted ashes and water. For most chemical processes, where only a small degree of heat is requisite, these furnaces answer beyond any thing that has hitherto been attempted. The whole is to be supported by an iron ring with three feet.

101
Melting
furnace.
fig. 2.

When furnaces are used in the large way they are always built of brick, and each particular operation has a furnace allotted for itself. The melting-furnace, where very large quantities of matter are not to be melted at once, requires only to be built of brick in such a form as we have already described; only, as it would perhaps be troublesome to procure a dome of the proper figure, the forepart of it may be left entirely open for the admission of melting vessels. The opening may be closed up with bricks and earth, during the operation. There is no necessity for having the inside of a circular form; a square one will answer the purpose equally well. According to the author of the Chemical Dictionary, when the internal diameter D C of such a furnace is 12 or 15 inches, the diameter of the tube G I, 8 or 9 inches, and its height 18 or 20 feet, and when the furnace is well supplied with fuel, an extreme heat is produced; in less than an hour the furnace will be white and dazzling like the sun; its heat will be equal to the strongest glass-house furnace; and in less than two hours will be melted whatever is fusible in furnaces. The hottest part is at H F, 4 or 6 inches above the grate. A plate-iron tube may be advantageously supplied by a short chimney of bricks, built under a pretty high vent, so as the whole may easily be stopped, except that passage which transmits the smoke of the furnace. By this means a very strong current of air will be made to pass through the fuel.

Chemists have generally believed that a wide and high ash-hole greatly increases the power of a melting furnace; but this advantage is found to be merely imaginary, as well as that of introducing the air through a long tube to the ash-hole; unless where the furnace is placed in a close room, so that it is necessary to furnish a greater blast of air than can otherwise have access.

For the form of the furnaces necessary in assaying and smelting of ores, or making glass, see ESSAYING, GLASS, and SMELTING.

When large stills, sand-pots, &c. are to be fixed, with a view to daily use, it is a matter of no small consequence to have them put up in a proper manner. The requisites here are, 1. That the whole force of the fire should be spent on the distilling vessel or sand-pot, except what is necessarily imbibed by the walls of the furnace. 2. That the vessels should be set in such a manner as that they may receive heat even from the furnace walls: for a still which contains any liquid,

102
Stills, sand-
pots, &c.
how to set.

can never be made so hot as a piece of dry brick. 3. It is absolutely necessary that the force of the fire be not allowed to collect itself upon one particular part of the vessel; otherwise that part will soon be destroyed. 4. The draught of air into furnaces of this kind ought to be moderate; only so much as will prevent smoke. If a strong blast of air enters, not only a great part of the heat will be wasted by going up the chimney, but the outside of the vessel will be calcined every time the fire is kindled, and thus must be soon rendered unfit for use.

There are few of the common workmen that are capable of building furnaces properly; and it is very necessary for a chemist to know when they are properly done, and to make the workmen act according to his directions. As the still, or whatever vessel is to be fixed, must have a support from the furnace on which it is built, it is evident the whole of its surface cannot be exposed to the fire. For this reason many of these vessels have had only their bottom exposed to the fire; no more space being left for the action of the heat, than the mere circular area of the still bottom; and the fire, passing directly through a hole in the back part of the building, which communicated with a chimney, and consequently had a strong draught, scarce spent any of its force on the still, but went furiously up the chimney. By this means an extraordinary waste of fuel was occasioned; and that part of the still-bottom which was next the chimney receiving the whole force of the flame, was soon destroyed. Attempts were made to remedy this inconvenience, by putting the fire something forward, that it might be at a greater distance from the chimney, and consequently might not spend its force in the air. This too was found to avail very little. A contrivance was then fallen upon to make the vent pass round the body of the still in a spiral form. This was a considerable improvement; but had the inconvenience of making the fire spend itself uselessly on the walls of the furnace, and besides wasted that part of the still which touched the under part of the vent. A much better method is to build the back part of the furnace entirely close, and make the fire come out through a long narrow opening before, after which it passes out through a fine in the back and upper part of the furnace, into the chimney.

The only inconvenience of this form is, that the vent must either be very wide, or it is apt to choke up with soot, which last is a very troublesome circumstance. If the vent is made very wide, a prodigious draught of air rushes through the fuel, and increases the heat to such a degree as to calcine the metal of which the still is made; and, on the other hand, nothing can be more disagreeable than to have the vent of a furnace stopped up with soot. These inconveniences, however, are totally avoided by making two small vents, one on each side of the distilling vessel, which may communicate with a chimney, by means of two tubes either of plate-iron, or formed with clay or bricks, which may be occasionally taken off if they happen to be choked up. The vessel is to be supported by three trunnions, so that the whole surface may be exposed to the fire, excepting a ring the thickness of a brick all round; so that a very strong heat will

will

PRACTICE will be communicated, although the furnace draws but little. The two small vents on each side will draw the flame equally; and by this means the most equal heat can be preserved, and may be pushed so far, as to make the whole bottom and sides of the vessel intensely red. Such a construction as this is more especially useful for sand-pots, and those which are used for distilling alkaline spirits from bones.

In the use of the furnaces hitherto described, the attendance of the operator is necessary, both for inspecting the process, and for supplying and animating the fuel. There are some operations of a slower kind, that require a gentle heat to be continued for a length of time; while demand little attendance in regard to the operations themselves; and in which, of consequence, it is extremely convenient to have the attendance in regard to the fire as much as possible dispensed with. This end has been answered by the furnace called *athanor*; but the use of it has been found attended with some inconveniences, and it is now generally laid aside.

Sundry attempts have been made for keeping up a continued heat, with as little trouble as in the *athanor*, by the flame of a lamp; but the common lamp-furnaces have not answered so well as could be wished. The lamps require frequent snuffing, and smoke much; and the soot accumulated on the bottom of the vessel placed over them, is apt, at times, to fall down and put out the flame. The largeness of the wick, the irregular supply of oil from the reservoir by jets, and the oil being suffered to sink considerably in the lamp, so that the upper part of the wick burns to a coal, appeared to be the principal causes of these inconveniences; which, accordingly, were found to be in great measure remedied by the following construction.

Fig. 8.

The lamp consists of a brass pipe, 10 or 12 inches long, and about a quarter of an inch wide, inserted at one end into the reservoir of the oil, and turned up at the other to an elbow, like the bole of a tobacco-pipe, the aperture, which is extended to the width of near two inches. On this aperture is fitted a round plate, having 5, 6, or 7 small holes, at equal distances, round its outer part, into which are inserted as many pipes about an inch long: into these pipes are drawn threads of cotton, all together not exceeding what in the common lamps form one wick: by this division of the wick, the flame exposes a larger surface to the action of the air, the fuliginous matter is consumed and carried off, and the lamp burns clear and vivid.

The reservoir is a cylindric vessel, eight or ten inches wide, composed of three parts, with a cover on the top. The middle partition communicates, by the lateral pipe, with the wicks; and has an up-

right open pipe folded into its bottom, whose top reaches as high as the level of the wicks; so that, when this part is charged with oil, till the oil rises up to the wicks in the other end of the lamp, any further addition of oil will run down through the upright pipe into the lower division of the reservoir. The upper division is designed for supplying oil to the middle one; and, for that purpose, is furnished with a cock in the bottom, which is turned more or less, by a key on the outside, that the oil may drop fast enough to supply the consumption, or rather faster, for the overplus is of no inconvenience, being carried off by the upright pipe; so that the oil is always, by this means, kept exactly at the same height in the lamp. For common uses, the middle division alone may be made to suffice; for, on account of its width, the linking of oil will not be considerable in several hours burning. In either case, however, it is expedient to renew the wicks every two or three days; oftener or seldom, according as the oil is more or less foul; for its impure matter, gradually left in the wicks, occasions the flame to become more and more dull. For the more convenient renewing of them, there should be two of the perforated plates; that, when one is removed, another, with wicks fitted to it, may be ready to supply its place.

One of the black lead-pots, recommended by Dr Lewis for his portable furnace, makes a proper furnace for the lamp. If one is to be fitted up on purpose for this use, it requires no other aperture than one in the bottom for admitting air, and one in the side for the introduction of the elbow of the lamp. The reservoir stands on any convenient support without the furnace. The stopper of the side aperture consists of two pieces, that it may be conveniently put in after the lamp is introduced; and has a round hole at its bottom fitting the pipe of the lamp. By these means, the furnace being left upon a trestle or open foot, the air enters only underneath, and spreads equally all round, without coming in streams, whence the flame burns steady. It is not advisable to attempt raising the heat higher than about the 450th degree of Fahrenheit's thermometer, a heat somewhat more than sufficient for keeping tin in perfect fusion. Some have proposed giving a much greater degree of heat in lamp-furnaces, by using a number of large wicks; but when the furnace is so heated, the oil emits copious fumes, and its whole quantity takes fire. The balneum, or other vessel including the subject-matters, is supported over the flame by an iron ring, as already described in the sand-bath and still: a bath is here particularly necessary, as the subject would otherwise be very unequally heated, only a small part of the vessel being exposed to the flame.

PART II. PRACTICE OF CHEMISTRY.

SECT. I. *Salts.*

I. VITRIOLIC ACID, and its Combinations.

103

Never found pure.

THE vitriolic acid is never found pure, but always united with some proportion, either of phlogiston, or metallic and earthy substances. Indeed there is

scarce any kind of earth which does not contain some portion of this acid, and from which it may always some way or other be separable. When pure, the vitriolic acid appears in the form of a transparent colourless liquor. By distilling in a glass retort, the aqueous part arises, and the liquor which is left becomes gradually more and more acid. This operation is generally

PRACTICE

104
Rectifica-
tion.

nerally called the *rectification*, or *dephlegmation*, of the acid. After the distillation has gone on for some time, the water adheres more strongly to what remains in the retort, and cannot be forced over without elevating part of the acid along with it. The remaining acid, being also exceedingly concentrated, begins to lose its fluidity, and puts on the appearance of a clear oil. This is the state in which it is usually sold, and then goes by the name of *oil of vitriol*. If the distillation is still further continued, with a heat below 600° of Fahrenheit's thermometer, the acid gradually loses more and more of its fluidity, till at last it congeals in the cold, and becomes like ice. In this state it is called the *icy oil of vitriol*. Such exceeding great concentration, however, is only practised on this acid for curiosity. If the heat be suddenly raised to 600°, the whole of the acid rises, and generally cracks the receiver. Clear oil of vitriol is immediately turned black by an admixture of the smallest portion of inflammable matter.

105
Attracts
moisture
from the
air.

The icy oil of vitriol, and even that commonly sold, attracts the moisture of the air with very great force. Newman relates, that having exposed an ounce of this acid to the air, from September 1736 to September 1737, at the end of the twelvemonth it weighed seven ounces and two drachms; and thus had attracted from the air above six times its own weight of moisture. This quantity, however, seems extraordinary; and it is probable, that in so long a time some water had been accidentally mixed with it; for Dr Gould, professor at Oxford, who seems to have tried this matter fully, relates that three drachms of oil of vitriol acquired, in 57 days, an increase only of six drachms and an half. The acid was exposed in a glass of three inches diameter; the increase of weight the first day was upwards of one drachm; in the following days less and less, till, on the fifty-sixth, it scarce amounted to half a grain. The liquor, when saturated with humidity, retained or lost part of its acquired weight, according as the atmosphere was in a moist or dry state; and this difference was so sensible as to afford an accurate hygrometer. Hoffman having exposed an ounce and two scruples in an open glass-dish, it gained seven drachms and a scruple in 14 days.

106
Productive
both of cold
and heat.

This acid, when mixed with a large quantity of water, makes the temperature something colder than before; but if the acid bears any considerable proportion to the water, a great heat is produced, so as to make the vessel insupportable to the hand; and therefore such mixtures ought very cautiously, or rather not at all, to be made in glass vessels, but in the common stone-bottles, or leaden vessels, which are not apt to be corroded by this acid. The greatest heat is produced by equal parts of acid and water.

107
Quantity of
alkali satu-
rated by it.

Though the vitriolic acid unites itself very strongly with alkalies, both fixed and volatile, it does not saturate near so much of the latter as of the former. A pound of oil of vitriol will saturate two of the common fixed alkali, but scarce one of volatile alkali. The specific gravity of good oil of vitriol is to water as 17 to 8.

108
Effects on
the human
body.

If the concentrated acid is applied slightly and superficially to the skin of a living animal, it raises a

violent burning heat and pain; but a larger quantity pressed on, so as to prevent the ingress of aerial moisture, occasions little pain or erosion. If diluted with a little water, it proves corrosive in either case. Largely diluted with water, this acid is employed medicinally for checking putrefaction, abating heat, and quenching thirst; in debilities of the stomach, and heartburn. To persons of weak and misound lungs, to women who give suck, to hydropic or emaciated persons, it is injurious. Some recommend it as a collyrium for sore eyes; but as it conglutates the animal juices, corroding and indurating the solids, it seems very unfit for being applied to that tender organ.

109
Difficulty
of procu-
ring it by
itself.

The vitriolic acid is so much used in different arts and manufactures, that the making of it has become a trade by itself; and the procuring it in plenty, and at a cheap rate, would be a very advantageous piece of knowledge to any person who could put it in practice. This, however, is very far from being easily done; for though it exists in almost every mineral substance, the attraction betwixt this acid and the bases with which it unites, is found to be so strong, that we can only decompose such combinations by presenting another substance to the acid, to which it has a greater attraction than that one wherewith it is joined. Thus the first combination is indeed dissolved, but we have another from which it is equally difficult to extricate the acid by itself. Thus, if we want to disengage the vitriolic acid from any metallic substance, suppose iron, this may be easily done by throwing a calcareous earth into a solution of green vitriol. We have now a compound of vitriolic acid with the calcareous earth, which is known by the name of *gypsum* or *scenites*. If we want to decompose this, we must apply a volatile or a fixed alkali; and the result of this will constantly be a new combination, which we are unable to decompose, and indeed more so, than the first. There are two general methods which have been in use for procuring the vitriolic acid in such quantity as to supply the demands of trade. The one is from pyrites, and the other from sulphur.

The extraction of Vitriolic Acid from *Pyrites*, the making of Coppersas, and obtaining the pure Oil of Vitriol from it.

110
Pyrites,
where
found.

Pyrites are found in large quantity in the coal-mines of England, where most of the coppersas is made. They are very hard and heavy substances, having a kind of brassy appearance, as if they contained that metal; and hence they are called *brasses* by the workmen. A very large quantity of these is collected, and spread out upon a bed of stiff clay to the depth of three feet. After being some time exposed to the air, the uppermost ones lose their metallic appearance, split, and fall to powder. The heaps are then turned, the under part uppermost, so as to expose fresh pyrites to the air. When they are all reduced to powder, which generally requires three years, the liquor, which is formed by the rain-water running from such a large mass, becomes very acid, and has likewise a styptic vitriolic taste. It is now conveyed into large cisterns lined with clay, whence it is pumped into a very large flat vessel made of lead. This vessel, which contains about 15 or 20 tons of liquor, is supported by cast-iron plates

PRACTICE

plates about an inch thick, between which and the lead a bed of clay is interposed. The whole rests upon narrow arches of brick, under which the fire is placed. Along with the liquor, about half a ton or more of old iron is put into the evaporating vessel. The liquor, which is very far from being saturated with acid, acts upon the iron, and, by repeated filling up as it evaporates, dissolves the whole quantity. By the time this quantity is dissolved, a pellicle is formed on the surface. The fire is then put out; and as such a prodigious quantity of liquor does not admit of filtration, it is left to settle for a whole day, and then is let off by a cock placed a little above the bottom of the evaporating vessel, so as to allow the impurities to remain behind. It is conveyed by wooden spouts to a large leaden cistern, five or six feet deep, sunk in the ground, and which is capable of containing the whole quantity of liquor. Here the copperas crystallizes on the sides, and on sticks put into the liquor. The crystallization usually takes up three weeks. The liquor is then pumped back into the evaporating vessel; more iron, and fresh liquor from the pyrites, are added; and a new lution takes place. See n^o 41.

Copperas is used, in dyeing, for procuring a black colour; and is an ingredient in making common ink. It is also used in medicine as a corroborant, under the name of *salt of steel*; but before it is used with this intention, it is redissolved in water, and crystallized, with the addition of a little pure oil of vitriol. Whether it is at all mended by this supposed purification, either in appearance or quality, is very doubtful.

This process furnishes us first with a very impure vitriolic acid, which could not be applied to any useful purpose; afterwards with an imperfect neutral salt, called *green vitriol*, which is applicable to several purposes where the pure acid itself could not be used; but still the acid by itself is not to be had, without a very troublesome operation.

Though this acid adheres very strongly to iron, it is capable of being expelled from it by fire; yet not without a very violent and long-continued one. If we attempt to distil green vitriol in a retort, it swells and boils in such a manner by the great quantity of water contained in its crystals, that the retort will almost certainly crack; and though it should not, the salt would be changed into an hard stony mass, which the fire could never sufficiently penetrate so as to extricate the acid. It must therefore be calcined, previous to the distillation. This is best done in flat iron-pans, set over a moderate fire. The salt undergoes the watery fusion, (see *Fusion*); after which it becomes opaque and white. By a continuance of the fire, it becomes brown, yellow, and at last red. For the purposes of distillation, it may be taken out as soon as it has recovered its solidity.

The dry vitriol, being now reduced to powder, is to be put into an earthen retort, or rather long neck, (a kind of retort where the neck issues laterally, that the vapours may have little way to ascend,) which it may nearly fill. This retort must be placed in a furnace capable of giving a very strong heat, such as the melting furnace we have already described. A large receiver is to be fitted on; and a small fire made in the furnace, to heat the vessels gradually. White

fumes will soon come over into the receiver, which will make the upper part warm. The fire is to be kept of an equal degree of strength, till the fumes begin to disappear, and the receiver grows cool. It is then to be increased by degrees; and the acid will become gradually more and more difficult to be raised, till at last it requires an extreme red, or even white heat. When nothing more will come over, the fire must be suffered to go out, the receiver be muffled, and its contents poured into a bottle fixed with a glass stopper. A sulphureous and suffocating fume will come from the liquor, which must be carefully avoided. In the retort, a fine red powder will remain, which is used in painting, and is called *colcothar of vitriol*. It is useful on account of its durability; and, when mixed with tar, has been employed as a preservative of wood from rotting; but Dr Lewis prefers finely powdered pit-coal. As a preservative for masts of ships, he recommends a mixture of tar and lamp-black, concerning which he relates the following anecdote.

"I have been favoured by a gentleman on board of a vessel in the East Indies, with an account of a violent thunder-storm, by which the main-mast was greatly damaged, and whose effects on the different parts of the mast were pretty remarkable. All the parts which were greased or covered with turpentine were hurt in pieces: those above, between and below the greased parts, as also the yard-arms, the round top or scaffolding, coated with tar and lamp-black, remained unurt."

Oil of vitriol, when distilled in this manner, is altered into a black colour, and must therefore be rectified by distillation in a glass retort. When the acid has attained a proper degree of strength, the blackness either flies off, or separates and falls to the bottom, and the liquor becomes clear. The distillation is then to be discontinued, and the clear acid which is left in the retort kept for use.

This was the first method by which the vitriolic acid was obtained; and from its being distilled from vitriol has ever since retained the name of *oil of vitriol*. Green vitriol is the only substance from which it is practicable to draw this acid by distillation; when combined with calcareous earths, or even copper, (though to this last it has a weaker attraction than to iron,) it resists the fire most obstinately. When distillation from vitriol was practised, large furnaces were erected for that purpose, capable of containing an hundred long necks at once: but as it has been discovered to be more easily procurable from sulphur, this method has been laid aside, and it is now needless to describe these furnaces.

To procure the Vitriolic Acid from Sulphur.

This substance contains the vitriolic acid in such plenty, that every pound of sulphur is reckoned to contain 15 ounces of pure acid; which being in a state perfectly dry, is consequently of a strength far beyond that of the most highly rectified oil of vitriol. Common oil of vitriol requires to be distilled to one fourth of its quantity before it will coagulate when cold; and even in this state, it undoubtedly contains some water. Making allowances, therefore, for the acid which rises in distillation, we may reckon, that in a pound

pound of oil of vitriol, 10 ounces are mere water. Every pound of sulphur therefore, if all the acid it contains could be preserved, ought to yield two pounds and an half of highly concentrated acid. No method, however, has as yet been fallen upon to condense all the steams of burning sulphur; nor is any other profitable way of decomposing sulphur known, than that by burning; and in this way the most successful operators have never obtained more than 14 ounces of oil from a pound of sulphur.

116
Methods of
obviating
the difficul-
ties in this
process.

The difficulties here are, that sulphur cannot be burnt but in an open vessel; and the stream of air, which is admitted to make it burn, also carries off the acid which is emitted in the form of smoke. To avoid this, a method was contrived of burning sulphur in large glass globes, capable of containing an hog's head or more. The fume of the burning sulphur was then allowed to circulate till it condensed into an acid liquor. A greater difficulty, however, occurs here; for though the sulphur burns very well, its steams will never condense. It has been said, that the condensation is promoted by keeping some warm water continually smoking in the bottom of the globe; and even Dr Lewis has asserted this: but the steam of warm water immediately extinguishes sulphur, as we have often experienced; neither does the fume of burning sulphur seem at all inclinable to join with water, even when forced into contact with it. As it arises from the sulphur, it contains a quantity of phlogiston, which in a great measure keeps it from uniting with water; and the desideratum is not something to make the sulphur burn freely, but to deprive the fumes of the phlogiston they contain, and render them miscible with water. For this purpose nitre has been advantageously used. This consumes a very large quantity of the phlogiston contained in sulphur, and renders the acid easily condensable: but it is plain that few of the fumes, comparatively speaking, are thus deprived of the inflammable principle; for the vessel in which the sulphur and nitre are burnt, remains filled with a volatile and most suffocating fume, which extinguishes flame, and issues in such quantity as to render it highly dangerous to stay near the place. It has been thought that nitre contributes to the burning of the sulphur in close vessels; but this too is a mistake. More sulphur may be burnt in an oil of vitriol globe without nitre than with it, as we have often experienced; for the acid of the sulphur unites with the alkaline basis of the nitre, and forms therewith an unflammable compound, which soon extinguishes the flame, and even prevents a part of the sulphur from being burnt either at that time or any other.

117
Efferve-
scence be-
tween the
nitrous and
sulphureous
fumes.

In the condensation of the fumes of sulphur by means of nitre, a remarkable effervescence happens, which naturally leads us to think that the condensation is produced by some struggle between the vitriolic and nitrous acids.—Dr Lewis is of opinion that the acid thus obtained is perfectly free from an admixture of the nitrous acid: but in this he is certainly mistaken; for, on rectifying the acid produced by sulphur and nitre, the first fumes that come over are red, after which they change their colour to white. How the nitrous acid should exist in the liquor, indeed, does not appear; for this acid is totally destructible by deflagra-

VOL. III.

tion with charcoal: but it does not follow, that because the nitrous acid is destroyed when deflagrated with charcoal, that it must likewise be so if deflagrated with sulphur. Indeed, it certainly is not; for the clystus of nitre made with sulphur, is very different from that made with charcoal. (See *Nitrous Acid decomposed by Charcoal*, below). This is not the only instance in which we must not reason too close from analogy.

The proportions of nitre to the sulphur, used in the large oil of vitriol works are not known, every thing being kept as secret as possible by the proprietors. Dr Lewis reckons about six pounds of nitre to an hundred weight of sulphur; but from such experiments as we have made, this appears by far too little. An ounce and an half, or two ounces, may be advantageously used to a pound of sulphur. In greater proportions, nitre seems prejudicial.

118
Lead ves-
sel, an im-
provement.

A very great improvement in the apparatus for making oil of vitriol, lies in the using lead vessels instead of glass globes. The globes are so apt to be broken by accident, or by the action of the acid upon them, that common prudence would suggest the use of lead to those who intend to prepare any quantity of vitriolic acid, as it is known to have so little effect upon the metal. The leaden vessels, according to the best accounts we have been able to procure, are cubes of about three feet, having on one side a door about six inches wide. The mixture of sulphur and nitre is placed in the hollow of the cube, in an earthen saucer, set on a stand made of the same materials. The quantity which can be consumed at once in such a vessel is about two ounces. To prevent the remains from sticking to the saucer, it is laid on a square bit of brown paper. The sulphur being blinded, the door is to be close shut, and the whole let alone for two hours. In that time the fumes will be condensed. The door is then to be opened; and the operator must immediately retire, to escape the suffocating fumes which issue from the vessel. It will be an hour before he can safely return, and introduce another quantity of materials, which are to be treated precisely in the same manner.

Where oil of vitriol is made in large quantities, the slowness of the operation requires a great number of globes, and constant attendance day and night. Hence the making of this acid is very expensive, and none but men of fortune need attempt it. The apparatus usually costs L. 1500.

Vitriolic Acid combined with fixed Alkali.

119
Vitriolated
tartar.

Dilute a pound of oil of vitriol with ten times its quantity of water; dissolve also two pounds of fixed alkaline salt in ten pounds of water, and filter the solution. Drop the alkali into the acid, as long as any effervescence arises; managing matters so, that the acid may prevail. The liquor will now be a solution of the neutral salt called *vitriolated tartar*, which may be procured in a dry form, either by exsiccation or crystallization. In case the later method is made use of, some more alkali must be added when it is set to evaporate, for this salt crystallizes best in an alkaline liquor. See n^o 74.

Concerning the preparation of this salt, Neuman
10 Z relates

PRACTICE relates several experiments which seem to have been very inaccurately made; and many circumstances which we are assured, from later discoveries, cannot possibly be true. "I prepared," says he, "a caustic alkali, by mixing one ounce of pure alkaline salt with two ounces of quicklime; boiling the mixture in fresh parcels of water till the liquor no longer acquired any saline taste; then filtering the several decoctions, and evaporating them to dryness. The dry salt weighed two scruples and an half more than the alkali employed; and the remaining lime weighed a drachm less than at first."

Here, we are sure, that he must have been mistaken; for as a pure alkali loses weight by being deprived of its fixed air, so the quicklime gains by being combined with the fixed air which the alkali loses; but Neuman's account would cause us believe, that the contrary took place.—He further takes notice, that having added by degrees two drachms of spirit (probably the oil) of vitriol, to one of the caustic alkali, a perfect saturation took place. During the effervescence a bright brownish earth fell to the bottom, which weighed, when dry, three grains. The filtered liquor deposited in evaporation first five grains and an half of white earthy creme, and afterwards five grains of a yellowish one. The dried salt weighed only two scruples and eight grains. During the saturation an abominable urinous smell arose, from which the exsiccated salt was not wholly free.

On this experiment we may observe, in the first place, that if the alkali had been perfectly caustic, little or no effervescence would have taken place. (See A18). If the spirit of vitriol was highly rectified, the quantity was by far too great for the alkali. If it was not rectified, there can be no judgment formed concerning the experiment. The quantity of salt left, too, is much less than it ought to have been; for the vitriolic acid adds greatly to the weight of those substances which it unites with. The urinous smell is totally unaccountable. Several other strange appearances are mentioned by this author, on trial of mild alkalies, and differences which happened on mixing the acid with the alkali, or the alkali with the acid; but all of them have so much the appearance of inaccuracy, that they can by no means be depended on.

Other methods, besides that above described, have been recommended for preparing vitriolated tartar; particularly that of using green vitriol instead of the pure vitriolic acid. In this case the vitriol is decomposed by the fixed alkali; but as the alkali itself dissolves the calx of iron after it is precipitated, it is next to impossible to procure a pure salt by such a process; neither is there occasion to be solicitous about the preparation of this salt by itself, as the materials for it are left in greater quantity than will ever be demanded, after the distillation of spirit of nitre.

Vitriolated tartar is employed in medicine as a purgative; but is not at all superior to other salts which are more easily prepared in a crystalline form. It is very difficultly soluble in water, from which proceeds the difficulty of preparing it in a crystalline form; for if the acid and alkali are not very much diluted, the salt will be precipitated in powder, during the time of saturation.—It is very difficult of fusion, requiring

a strong red heat; but, notwithstanding its fixedness in a violent fire, it arises with the steam of boiling water in such a manner as to be almost totally dissipated along with it by strong boiling.—This salt has been used in making glass; but with little success, as the glass wherein it is an ingredient always proves very brittle and apt to crack of itself.

If, instead of the vegetable fixed alkali, the vitriolic acid is saturated with the fustile one called the *salt of Soda*, a kind of neutral salt will be produced, having very different properties from the vitriolated tartar. This compound is called *Glauber's salt*. It dissolves easily in water, shoots into long and beautiful crystals, which contain a large quantity of water, in consequence of which they undergo the aqueous fusion when exposed to heat. They are also more easily fusible than vitriolated tartar.—This kind of salt was formerly much recommended as a purgative, and from its manifold virtues was intitled by its inventor *sal mirabile*. It is, however, found to possess no virtue different from that of other purgative salts; and its use is, in many places, entirely superseded by a salt prepared from the *bitters*, or liquor which remains after the crystallization of sea-salt, which shall be afterwards described.

Vitriolic Acid combined with Volatile Alkali.

Take any quantity of volatile alkaline spirit; that prepared with quicklime is preferable to the other, on account of its railing no effervescence. Drop into this liquor, contained in a bottle, diluted oil of vitriol, shaking the bottle after every addition. The saturation is known to be complete by the volatile smell of the alkali being entirely destroyed. When this happens, some more of the spirit must be added, that the alkali may predominate a little, because the excess will fly off during the evaporation. The liquor, on being filtered and evaporated, will shoot into fine fibrous plates like feathers. This salt, when newly prepared, has a sulphureous smell, and a penetrating pungent taste. It readily dissolves in water, and increases the coldness of the liquor; on standing for a little time, it begins to separate from the water, and vegetate, or arise in efflorescences up the sides of the glass. It easily melts in the fire; penetrates the common crucibles; and if sublimed in glass vessels, which requires a very considerable heat, it always becomes acid, however exactly the saturation was performed.

This salt has been dignified with the names of *Glauber's secret sal ammoniac*, or *philosophic sal ammoniac*, from the high opinion which some chemists have entertained of its activity upon metals; but from Mr Pott's experiments, it appears, that its effects have been greatly exaggerated. It dissolves or corrodes in some degree all those metals which oil of vitriol dissolves, but has no effect upon those on which that acid does not act by itself.

Gold is not touched in the least, either by the salt in fusion, or by a solution of it: the salt added to a solution of gold in aqua regia occasions no precipitation or change of colour. On melting the salts with inflammable matters, it forms a sulphureous compound, which dissolves gold in fusion, in the same manner as compositions of sulphur and fixed alkaline salt. Melt-

Properties
of the salts.

PRACTICE ed with silver, it corrodes it into a white calx, which partially dissolves in water: it likewise precipitates silver from its solution in aqua fortis. It acts more powerfully on copper; elevates a part of the metal in sublimation, so as to acquire a bluish colour on the surface; and renders the greatest part of the residuum soluble in water. This solution appears colourless, so that it could not be supposed to hold any copper; but readily discovers that it abounds with that metal, by the blue colour it acquires on an addition of volatile alkali, and the green calx which fixed alkalies precipitate. In evaporation it becomes green without addition. Iron is corroded by this salt in fusion, and dissolved by boiling in a solution of it. Zinc dissolves more freely and more plentifully. Lead unites with it, but does not become soluble in water. Tin is corroded, and a part of the calx is soluble in boiling water. Of regulus of antimony, also, a small portion is made soluble. Alkalies precipitate from the solution a bluish powder. Calcined bismuth-ore treated with its equal weight of the salt, partly dissolved in water into a pale red liquor, which became green from heat, in the same manner as tinctures made from that ore by aqua regia. The undissolved part yielded still with fritt, a blue glass. On treating manganese in the same manner, aluminous crystals were obtained: the undissolved part of the manganese gave still a violet colour to glasses.

Vitriolic Acid combined with Calcareous Earth.

This combination may be made by saturating diluted oil of vitriol with chalk in fine powder. The mixture ought to be made in a glass; the chalk must be mixed with a pretty large quantity of water, and the acid dropped into it. The glass must be well shaken after every addition, and the mixture ought rather to be over saturated with acid; because the superfluous quantity may afterwards be washed off; the *scilicet*, as it is called, or *gypsum*, having very little solubility in water.

This combination of vitriolic acid with chalk or calcareous earth, is found naturally in such plenty, that it is seldom or never made, unless for experiments sake, or by accident. Mr Pott indeed says, that he found some slight differences between the natural and artificial gypsum, but that the former had all the essential properties of the latter.

The natural gypsums are found in hard, semitransparent masses, commonly called *alabaster*, or *plaster of Paris*. (See ALABASTER, GYPSUM, and PLASTER). By exposure to a moderate heat, they become opaque, and very friable. If they are now reduced to fine powder, and mixed with water, they may be cast into moulds of any shape; they very soon harden without shrinking; and are the materials wherof the common white images are made. This property belongs likewise to the artificial gypsum, if moderately calcined.

Mr Beaumé has observed, that gypsum may be dissolved in some measure by acids; but is afterwards separable by crystallization in the same state in which it was before solution, without retaining any part of the acids. This compound, if long exposed to a pretty strong heat, loses great part of its acid, and is con-

verted into quicklime. In close vessels, it gives over no acid with the most violent heat. It may be fused by suddenly applying a very violent heat. With clay it soon melts, as we have observed when speaking of the materials for making crucibles. A like fusion takes place when pure calcareous earth is mixed with clay; but gypsum bubbles and swells much more in fusion with clay than calcareous earth.

From natural gypsum we see that vitriolated tartar may be made, in a manner similar to its preparation from green vitriol. If fixed alkaline salt is boiled with any quantity of gypsum, the earth of the latter will be precipitated, and the acid united with the alkali. If a mild volatile alkali is poured on gypsum contained in a glass, and the mixture frequently shaken, the gypsum will in like manner be decomposed, and a *philosophic* sal ammoniac will be formed. With the caustic volatile alkali, or that made with quicklime, no decomposition enfues.

Vitriolic Acid combined with Argillaceous Earth.

The produce of this combination is *alum*; the nature of which was long unknown, but has been discovered by Messrs Geoffroy and Boulduc, to be the acid of vitriol imperfectly saturated with argillaceous earth. Whether the earth of alum pre-existed in the clay, having the same nature as afterwards in the salt of alum, the above-mentioned gentlemen did not determine. Dr Lewis has made some experiments on this subject, and is of opinion that some change is made upon the earth during the operation. His process is as follows. "Powdered tobacco-pipe clay being boiled in a considerable quantity of oil of vitriol, and the fire continued to dryness, the matter, examined when grown cold, discovers very little taste, or only a slight acidulous one. On exposure to the air for a few days, the greatest part of it was changed into lanuginous efflorescences, in taste exactly like alum. The remainder treated with fresh oil of vitriol in the same manner, exhibits the same phenomena, and this repeatedly, till nearly the whole of the clay is converted into an astringent salt."

Alum is never prepared for the purposes of trade by the above process; the materials for it are found in different places, and the method of extracting the alum differs according to the nature of these materials. Different kinds of it are known, under the names of *rock-alum*, *plume-alum*, &c.

That called *rock-alum* is usually of a reddish colour; and consequently seems impure, as containing a little vitriolic matter. It is nevertheless preferred, and sold at a higher price than the purer kinds. This seems to be the kind called by the author of the Chemical Dictionary *Roman alum*. He says, that on trial it was found perfectly free from any admixture of vitriolic matter; though it is difficult to account for its redness on this supposition.

This kind of alum is prepared in the territory of Civita Vecchia, about 14 leagues from Rome. It is prepared in produced from a hard stone which is found there, and is neither pyritous nor calcareous. It is calcined for 12 or 14 hours, after being broken in pieces. When thus calcined, it is laid in heaps upon places surrounded by ditches filled with water. It is sprinkled with this

PRACTICE water three or four times each day, for 40 days, or till the calcined stone is covered with a reddish efflorescence. Then the stones are boiled with water in caldrons to dissolve all the alum which is formed, and the water is evaporated to the point of crystallization. This water is made to flow quite hot into oaken vessels; where, by cooling, a great quantity of irregular crystals are formed, having a pale reddish tinge.

132
In Sweden. In Sweden is found a kind of mineral which yields sulphur, vitriol, and alum. This mineral appears to be a kind of pyrites. The sulphur is first extracted by distillation; the residuum, strongly calcined, is boiled in water, and the vitriol crystallized. What remains, being treated with urine, and a ley drawn from ashes, yields alum.

133
In England. In England, alum is prepared from certain black laminated argillaceous strata. Sometimes these require calcination, and at others only to be exposed to the open air, when they fall into powder in the same manner as the pyrites from which copperas is made.

The mineral, when sufficiently impregnated with alum, is boiled with water; the liquor boiled down, commonly with an addition of urine or alkaline ley, or both together. The clear part is poured off and set to shoot; the crystals, if not sufficiently pure, are dissolved again, boiled down with a little more alkali, and crystallized afresh.

134
Aluminous materials at Solfatara in Italy. Some earths have a manifestly aluminous taste when newly dug; and hence are directly boiled, without any previous preparation. Of this kind is the earth found at Solfatara in Italy, where large quantities of sulphur are also made. The author of the Chemical Dictionary says that this earth very much resembles the marble found in the same plain, but differs essentially from it in not effervescing with the nitrous acid.

Caldrons of lead, two feet and an half in diameter, and as much in depth, are filled with this earth or stone, to three quarters of their contents. These caldrons are sunk so as to be almost on a level with the ground, under a great sled, at the distance of about 400 paces from the sulphur furnaces. Water is thrown into each caldron till it rises three or four inches above the earth. The natural warmth of the ground is here sufficient to heat the matter, being upwards of 100° of Fahrenheit's thermometer. By this means fuel is spared; and the salt shoots in large crystals on the surface, as the water evaporates. The alum in this state, being mixed with many impurities, is carried to a building at the entry into Solfatara, where it is dissolved in a great stone-vessel shaped like a funnel. The alum is there crystallized again by the heat only of the ground, and becomes purer.

135
Near York. The alum flats, near York in England, are considerably sulphureous, and therefore require calcination to make them become aluminous. The reason of this is, that, during the calcination, the phlogiston is separated from the sulphur, and its acid combines with the aluminous earth. Long exposure to the air produces the same effect.

136
Crystallization. Alum is usually crystallized in large, strong, wooden casks; whose staves and hoops are all marked with numbers, that they may readily be put together. The liquor is either boiled down greatly beyond the crystallizing point, that so it may all congeal into one

PRACTICE lump when cold, or the crystals are taken out of the casks; and as they are capable of undergoing the aqueous fusion, they are by this means all cast into lumps. It is absolutely certain, that the huge masses in which alum is sold, can never be the effect of regular crystallization.

Plume alum is sometimes found native, and crystallized like feathers, in grottos through which aluminous waters pass. From Dr Lewis's experiment with tobacco-pipe clay, it appears that this kind is easily prepared. It is rarely found native, and is not used in commerce. The name of *plume alum* has been improperly given to other matters, such as a kind of asbestos; and by some alchemists to a compound formed of arsenic and vitriolic acid.

One remarkable circumstance attends the crystallization of alum, namely, that good crystals of it cannot be formed without the addition of an alkaline lixivium, or urine, to the liquor when set to crystallize. It was supposed, that, by adding these matters, some metallic or impure earthy substance, which prevented the crystallization, was precipitated; but Mr Margraaf found by experiments, that he could not form good crystals by combining vitriolic acid with earth of alum, with calcined alum, or with clay, unless he added a lixivium of fixed or volatile alkali, or urine. As the Roman alum is the only kind which is not prepared with these additions, it may possibly derive its superiority over other kinds of this salt from its want of such substances.

137
Solubility. Alum has an austere, sweetish, and strongly astringent taste. It is soluble, according to Neuman, in 10 times, according to others in 14 times its quantity of water. It dissolves in much greater quantity in hot than cold water. When evaporated to the crystallizing point, and slowly cooled, the greatest part of its crystals are found to be triangular pyramids, whose four angles seem cut off. It retains half its weight of water in crystallizing. When exposed to a moderate fire, it melts, bubbles, and swells up; and is gradually changed into a light, white, and spongy mass, called *calcined* or *burnt alum*. After evaporation, it may be again dissolved and crystallized as before.

138
Decomposition. This salt is very easily decomposed; and, according to the different substances made use of for this purpose, we may produce different compounds. From alum may be prepared a vitriolated tartar; a philosophic sal ammoniac, or gypsum, according as we use a fixed alkali, a volatile one, or a calcareous earth, for its decomposition. The last will as effectually and readily decompose alum, as fixed alkali itself. Nor is there any difference between the mild and caustic alkalies with regard to this salt, the latter decomposing it as readily as the first. Neither are these the only substances capable of decomposing alum. Iron itself, which has generally much less attraction for acids than earthy substances, will decompose it, and thus form a green vitriol or copperas.

Though the vitriolic acid, however, has so little attraction for the earthy basis of alum when in a moist state, it is obstinately retained by it when heated, neither is it possible to distil the acid from alum, as from vitriol. Mr Geoffroy put five pounds of calcined alum into an earthen retort, and exposed it to a most violent fire for six days and six nights, during which time he obtained only 3 ounces of vitriolic acid.

Alum

PRACTICE Alum is very much used in dyeing, and the preparations of some colours. It is likewise used in medicine as a styptic.

per with sulphur; and upon slowly burning the sulphur, its acid corrodes the copper. The metal is then to be boiled in water, that the saline part may be dissolved. The operation is to be repeated, till all the copper is consumed; and all the saline liquors are to be evaporated together to the crystallizing point. By this method, however, a great part of the acid is lost; and in Britain, where the sulphur must be imported, we should think the pure acid preferable for those who prepare blue vitriol.

PRACTICE

139
Epsom salt.

Vitriolic Acid combined with *Magnesia*.
The earthy substance called *magnesia alba* is never found by itself, and consequently this combination cannot originally take place by art. The vitriolic acid, however, is found combined with magnesia in great plenty in the bitter liquor which remains after the crystallization of common salt, from whence the magnesia is procured by precipitating with a fixed alkali. If this liquor, which, when the common salt is extracted, appears like clear oil of vitriol, is set by for some time in a leaden vessel, a large quantity of salt shoots, very much resembling Glauber's salt mirabile. This salt is in many places sold instead of the true Glauber's salt; and is preferred to it, because the true salt mirabile calcines in dry air, which the spurious kind does not. If after the first crystallization of the bitter, the remainder is gently evaporated farther, a fresh quantity of Glauber's salt will shoot; and if the liquor is then hastily evaporated, a salt will still be crystallized; but, instead of large regular crystals, it will congregate into very small ones, having something of the appearance of snow, when taken out of the liquid. These salts are essentially the same, and are all used in medicine as purgatives. The salt shot into small crystals is termed *Epsom salt*, from its being first produced from the purging waters at Epsom in England. The bitter affording this kind of salt in such great plenty, these waters were soon neglected, as they yielded it but very sparingly, and the quantity prepared from them was insufficient for the demand. Neuman says, that having inspissated 100 quarts of Epsom water, he scarce obtained half an ounce of saline matter.

140
Silver.

Combinations of Vitriolic Acid with Metals.

1. *Silver*. Oil of vitriol boiled on half its weight of silver filings, corrodes them into a saline mass. This substance is not used in medicine, nor in the arts. The only remarkable property of it is, that it has a very strong attraction for mercury; coagulating and hardening as much quicksilver as the acid weighed at first. If the hard concrete be diluted with fresh acid, it melts easily in the fire, and does not part with the mercury in the greatest heat that glass vessels can sustain. The vitriolic acid, by itself, strongly retains mercury, but not near so much as when combined with silver.

Silver thus corroded by the vitriolic acid, or precipitated by it from the nitrous, may in great part be dissolved, by cautiously applying a very little water at a time; and more effectually by boiling in fresh oil of vitriol.

141
Copper.

2. *Copper*. With this metal the vitriolic acid cannot be combined, unless in its concentrated state, and strongly heated. If pure oil of vitriol is boiled on copper filings, or small pieces of the metal, it dissolves it into a liquor of a deep blue colour, which easily crystallizes. The crystals are of a beautiful blue colour, and are sold under the name of *blue vitriol*, or *Roman vitriol*.

142
Blue vitriol, how made. Roman vitriol is found in great plenty, however, where sulphur is made by stratifying thin plates of cop-

per with sulphur; and upon exposing to the fire, first turns white, then of a yellowish red colour. On urging it with a strong fire, the acid slowly exhales, and a dark red calx of copper remains. The whole of the vitriolic acid cannot be expelled from copper by heat: as much of it still remains as to render a part of the metal soluble in water. After this soluble part has been extracted, a little acid is still retained, amounting to about $\frac{1}{2}$ of the calx.

Vitriol of copper is employed in medicine as a caustic, in which respect it is very useful; but when used internally, is dangerous, as indeed all the preparations of copper are found to be. It has, nevertheless, according to Neuman, been recommended in all kinds of intermittents, and the lepra. The smallest portion, he says, occasions a sickness and nausea; a somewhat larger, reaching and violent vomitings, accompanied often with convulsions. If the quantity taken has been considerable, and is not soon discharged by vomiting, the stomach and intestines are corroded, intense pains, inflammations, and death, succeed.

3. *Iron*. The vitriolic acid does not act upon this metal till considerably diluted. Common oil of vitriol requires to be mixed with ten or twelve times its quantity of water, before it will act briskly on the metal. In this state it effervesces violently with iron filings, or small bits of the metal, and a great quantity of inflammable vapour is discharged. (See *ATR.*) The liquor assumes a fine green colour; and, by evaporation and slow cooling, very beautiful rhomboidal crystals are formed. These are named *salt of steel*, and are used in medicine; but, for the salt made with the pure acid and iron, the common copperas, made with the impure acid extracted from pyrites, is commonly substituted. (See *Vitriolic Acid extracted from Pyrites*, above, n° 110.) This is generally esteemed a venial fraud, and no doubt is so in medicinal respects; but when it is considered, that, by this substitution, common copperas is imposed on the ignorant, at the price of 2 s. per pound, the affair appears in a different light.

Pure vitriol of iron is originally of a much more beautiful appearance than common copperas, and retains its colour much better; the reason of which seems to be, that the salt thus prepared is more free from phlogistic matters than the copperas. If either of the kinds, however, are exposed to the air for a sufficient length of time, part of the acid is dissipated, and the vitriol becomes yellowish or brownish. If the salt is now dissolved in water, a brown precipitate falls, which is part of the iron in a calcined state. If the liquor is separated from this precipitate by filtration, a similar one forms in a short time, and by long standing a considerable quantity subsides. According to Dr Lewis, the precipitation is greatly expedited

by

PRACTICE

by a boiling heat; by which more of the metal separates in a few minutes, than by standing without heat for a twelvemonth. This change takes place in no other metallic solutions.

148
Yellow for
house paint-
ing.

149
Preserva-
tive for
wood.

The calx of iron, precipitated by quicklime from green vitriol, appears, when dry, of a yellow colour; and is recommended, in the Swedish transactions, instead of yellow ochre, as a colour for house-painting. Solutions of green vitriol are also recommended for preserving wood, particularly the wheels of carriages, from decay. When all the pieces are fit for being joined together, they are directed to be boiled in a solution of vitriol for three or four hours; and then kept in a warm place for some days to dry. By this preparation, it is said, wood becomes so hard, that moisture cannot penetrate it; and that iron nails are not so apt to rust in this vitriolated wood as might be expected, but last as long as the wood itself.

150
Tin.

4. *Tin.* This metal cannot be dissolved in the vitriolic acid, but in the same manner as silver; namely, by boiling concentrated oil of vitriol to dryness upon filings of the metal. The saline mass may then be dissolved in water, and the solution will crystallize. The salt, however, formed by this union, is not applied to any useful purpose. A salt of tin, indeed, formed by the union of vitriolic acid with this metal, has been recommended for some medical purposes, and processes are given for it in the dispensatories; but they have never come much into practice.

151
Lead.

5. *Lead.* While lead is in its metallic state, the vitriolic acid acts very little upon it, either in a diluted, or concentrated state; but if the metal is dissolved in any other acid, and oil of vitriol added, a precipitation immediately ensues, which is occasioned by the combination of vitriolic acid with the lead. This precipitate will be more or less white, as the metal is more or less deprived of its phlogiston by calcination, before solution. If a little strong spirit of nitre is poured upon litharge, which is lead calcined to the greatest degree possible without vitrification, the acid unites itself to the metal with considerable effervescence and heat. Some water being now poured on, and the vial containing the mixture shaken, a turbid solution of the litharge is made. If a little oil of vitriol is then added, it throws down a beautifully white precipitate; and the acid of nitre, being left at liberty to act upon the remaining part of the litharge, begins a-new to dissolve it with effervescence. When it is again saturated, more oil of vitriol is to be dropped in, and a white precipitate is again thrown down. If any of the litharge is still undissolved, the nitrous acid, being set at liberty a second time, attacks it as at first; and, by continuing to add oil of vitriol, the whole of the litharge may be converted into a most beautiful and durable white. Unfortunately this colour cannot be used in oil, tho' in water it seems superior to any. If the process is well managed, an ounce of spirit of nitre may be made to convert several pounds of litharge into a white of this kind.

152
A beautiful
white co-
lour.

153
Quicksil-
ver.

6. *Quicksilver.* The dissolution of quicksilver in vitriolic acid cannot be performed but by a concentrated oil and strong boiling heat. The metal is first corroded into a white calx, which may afterwards be

easily dissolved by an addition of fresh acid. Every time it is dissolved, the mercury becomes more and more fixed and more difficult to dry. If the exsiccation and dissolution has been repeated several times, the matter becomes at last so fixed as to bear a degree of red heat. This combination is the basis of a medicine formerly of some repute, under the name of *turbith mineral*. The process for making turbith mineral is given by the author of the Chemical Dictionary as follows:

154
Turbith
mineral.

"Some mercury is poured into a glass retort, and upon it an equal quantity of concentrated oil of vitriol, or more, according to the strength of the acid. These matters are to be distilled together, in the heat of a sand-bath, till nothing remains in the retort but a dry saline mass, which is a combination of the vitriolic acid and mercury. The acid which passes into the receiver is very suffocating and sulphureous; which qualities it receives from the phlogiston of the mercury. The white saline mass which is left at the bottom of the retort is to be put into a large vessel; and upon it are to be poured large quantities of hot water, at several different times. This water weakens the acid, and takes it from the mercury; which is then precipitated towards the bottom of the vessel, in form of a very shining yellow powder. The water with which it is washed, contains the acid that was united with the mercury; and likewise a little mercury, rendered soluble by means of the very large quantity of acid.

Most chemists have believed, that a portion of vitriolic acid remains united with the turbith mineral, only too little to render it soluble in water. But Mr Beaumé, having examined this matter, affirms, that turbith mineral contains no acid, when it has been sufficiently washed; and that, by frequently boiling this preparation in a large quantity of distilled water, not a vestige of acid will adhere to it."

Dr Lewis, who is of opinion that the whole of this mercurial calx is soluble in a very large quantity of water, desires the water with which it is washed to be impregnated with some alkaline salt; which makes the yield of turbith greater than when pure water is used. The author of the Chemical Dictionary also observes, that the precipitate remains white till freed from the acid; and the more perfectly it is washed, the deeper yellow colour it acquires.

155
Dr Lewis's
directions.

7. *Zinc.* This femimetal is not acted upon by the vitriolic acid in its concentrated state; but, when diluted, is dissolved by it with effervescence, and with the extrication of an inflammable vapour in the same manner as iron. Neuman observes, that, during the dissolution, a grey and blackish spongy matter fell to the bottom; but, on standing for some days, was taken up, and dissolved in the liquor, nothing being left but a little yellowish dust scarcely worth mentioning. Six parts of oil of vitriol, diluted with an equal quantity of water, dissolves one part of zinc.

156
Zinc.

The product of this combination is *white vitriol*, which is used in medicine as an ophthalmic, and in painting for making oil-colours dry quickly: what is used for this purpose, however, is not made in Britain, but comes from Germany. It is made at Goslar by the following process. An ore containing lead and silver, having been previously roasted for the obtaining

157
White vi-
triol.

PRACTICE

taining of sulphur, (see METALLURGY), is livified with water, and afterwards evaporated in leaden boilers, as for the preparation of green vitriol: but here a regular crystallization is prevented; for when the salt has assumed any kind of crystalline form, these crystals are made to undergo the watery fusion in copper caldrons. It is then kept constantly stirring till a considerable part of the moisture is evaporated, and the matter has acquired the consistence of fine sugar. White vitriol generally contains some ferruginous matter, from which it may be entirely freed, by some fresh zinc; for this semimetal precipitates from the vitriolic acid all other metallic substances; but notwithstanding this strong attraction, the vitriolic acid is more easily expelled by distillation from white, than green, or blue vitriol. Towards the end of the distillation of white vitriol, the acid arises exceedingly concentrated, though sulphureous; so that, if mixed with common oil of vitriol, it will heat it almost as much as oil of vitriol heats water.

158
Regulus of
antimony.

8. *Regulus of Antimony.* To combine vitriolic acid with regulus of antimony, the same method must be used, as directed for uniting it with quicksilver, for making turbit mineral, viz. to employ a very concentrated acid, and to distil in close vessels. The same phenomena also occur in this case as in making turbit mineral; a very suffocating sulphureous acid rises; and, as Mr Geoffroy observes, a true sulphur sublimes into the neck of the retort; a white, saline, tumefied mass remains in the vessel; and when the vessels are unluted, a white fume issues, as in the smoking spirit of libavium. See *Combinations of marine acid with tin*, infra.

159
Regulus of
cobalt.

9. *Regulus of Cobalt.* The only accounts we have of the combination of vitriolic acid with this semimetal are, that it is slowly dissolved into a rose coloured liquor, which, in evaporation, throws off to the sides a blue powder, that on cooling grows white.

160
Arsenic.

10. *Arsenic.* Neuman relates, that powdered white arsenic being distilled in a retort with oil of vitriol, a transparent sublimate like glass arose, which in a few days lost its transparency, and became opaque like the arsenic itself. The arsenic remaining in the retort, sustained an open fire without any sensible alteration. The author of the Chemical Dictionary says, that if a concentrated vitriolic acid is distilled from arsenic, the acid which comes over smells exactly like marine acid. When the solution is distilled till no more acid rises, the retort is then almost red-hot, and no arsenic is sublimed; but it remains fused at the bottom of the retort; and, when cold, is found to be an heavy, compact mass, brittle and transparent as crystal-glass. This kind of arsenical glass, exposed to the air, soon loses its transparency from the moisture it attracts, which dissolves and partly deliquesces it. This deliquium is extremely acid.—None of the three last mentioned combinations have been found applicable to any useful purpose.

Vitriolic Acid combined with *Inflammable Substances.*

1. *Oil.* The product of this combination is a thick black substance, very much resembling balsam of sulphur in colour and consistence; to which it is sometimes substituted. If this substance is distilled with a

gentle heat, great part of the acid becomes volatile, and evaporates in white fumes, having a pungent smell resembling that of burning sulphur. This goes by the name of *volatile or sulphureous vitriolic acid*; and a salt was formerly prepared from it by saturation with fixed alkali, which was thought to possess great virtues. From its inventor it was called the *sulphureous salt of Stahl*. The most singular property of this volatile acid is, that though the vitriolic in its fixed state is capable of expelling any other acid from its basis, the volatile one is expelled by every acid, even that of vinegar. It is very difficultly condensable, as we have already taken notice; and, when mixed with water, seems scarcely at all acid, but rather to have a bitterish taste.

Several methods have been proposed for procuring this acid from burning sulphur, which yields it in its greatest degree of volatility, as well as concentration; but the produce is so exceedingly small, that none of them are worth mentioning. Dr Priestley has given very good directions for obtaining the volatile vitriolic acid in the form of air. His method was, to pour, on some oil of vitriol contained in a vial, a very small quantity of oil olive; as much as was sufficient to cover it. He then applied the proper apparatus for the reception of air in quicksilver, (see AIR); and, holding a candle to the vial, the volatile vitriolic acid rushed out in great quantity. Had he received this air in water, instead of quicksilver, the consequence would have been, that some part of it, at least, would have been absorbed by the water, and a sulphureous acid liquor produced. This seems indeed almost the only method of procuring the sulphureous vitriolic acid of any tolerable strength; but it is never required in the form of a liquor except for experimental purposes. The only useful property hitherto discovered about this kind of acid is, that it is remarkably destructive of colours of all kinds, and hence the fumes of sulphur are employed to whiten wool, &c.

2. *Phlogiston of Charcoal.* If charcoal is mixed with concentrated vitriolic acid, and the mixture distilled, the same kind of acid is at first obtained, which comes over when oil is used; and towards the end, when the matter begins to grow dry, a true sulphur sublimes. The best way, however, of producing sulphur from the vitriolic acid is by combining it, when in a perfectly dry state, with the phlogiston. By this means sulphur may very readily be made at any time. The process is generally directed to be performed in the following manner.

Reduce to fine powder any quantity of vitriolated tartar. Mingle it carefully with a 16th part of the weight of charcoal-dust. Put the whole into a covered crucible set in a melting furnace. Give a heat sufficient to melt the salt; and when thoroughly melted, pour it out on a flat stone. The vitriolated tartar and charcoal will now be converted into a sulphureous mass similar to a combination of alkaline salts with sulphur. See *Alkaline Salts*, below.

3. *Spirit of Wine.* The result of this combination is one of the extraordinary phenomena in chemistry; being that fluid, which, for its extreme degree of volatility, was first distinguished by the name of *ether*; and now, since a liquor of the like kind is discovered

to be preparable from spirit of wine by means of other acids, this species is distinguished by the name of *vitriolic ether*. The method of preparing this subtle liquor recommended by Mr Beaumé, seems to be the best of any hitherto discovered.

167
Ether.

" Mix together equal parts by weight, of highly rectified spirit of wine and concentrated oil of vitriol, or somewhat more than two measures of spirit of wine with one of the acid. The mixture is to be made in a flint glass-retort, the bottom and sides of which are very thin, that it may not break from the heat which is suddenly generated by the union of these two substances. The spirit of wine is first put into the retort, and then the acid is poured in by a glass-funnel, so that the stream may be directed against the side of the glass; in which case it will not exert much of its force on the spirit, but will lie quietly below at the bottom. The retort is now to be very gently shaken, that the acid may mingle with it by little and little. When the mixture is completed, very little more heat will be necessary to make the liquor boil.

This mixture is to be distilled with as brisk and quick a heat as possible; for which reason, immediately after the acid and spirit are mixed, the retort should be put into a sand furnace, heated as much as the mixture is. The distillation should be continued only till about one-third of the liquor is come over; if it is continued farther, part of the vitriolic acid rises in a sulphureous state. In the retort a thick, black, acid matter remains, which is similar to a combination of oil of vitriol with any inflammable matter, and from which a little sulphur may be obtained. Along with the sulphureous acid, a greenish oil, called *oil of vitriol dulcis*, arises, which has a smell compounded of that of the ether and sulphureous acid: and Mr Beaumé has shewn that it is compounded of these two; for if it is rectified with an alkali, to attract the acid, it is changed into ether. If, after the distillation of the ether, some water be poured into the retort, the liquor by distillation may be brought back to the state of a pure vitriolic acid.

As the steams of the ethereal liquor are exceedingly volatile, and at the same time a quick fire is necessary to the success of the operation, the receiver must be carefully kept cool with very cold water, or with snow. Care must also be taken to prevent any of the sulphureous acid steams from coming over; but as it is impossible to prevent this totally, the liquor requires rectification. This is the more necessary, as a part of the spirit of wine always rises unchanged. From the acid the liquor is easily set free, by adding a small quantity of alkaline salt, and re-distilling with a very gentle heat; but as spirit of wine is likewise very volatile, the distillation must be performed in a very tall glass. Dr Black recommends a matras, or bolt-head, with a tin pipe adapted to the head, so as to convey the steams at a right angle, to be condensed in the receiver.

Ether is the lightest of all known fluids, except air; and is so volatile, that *in vacuo* its boiling point is 20° below 0° of Fahrenheit's thermometer. If a small quantity is poured out on the ground, it instantly evaporates, diffusing its fragrance all through the room, and scarce perceptibly moistening the place on which

it fell. It difficultly mixes with water, as being of an oily nature: ten parts of water, however, will take up one part of ether. Its great volatility renders it serviceable in nervous diseases, and removing pains, when rubbed on with the hand, and kept from evaporating immediately. By spontaneous evaporation, it produces a great degree of cold. (See EVAPORATION and CONGELATION). The most extraordinary property, however, is, that if gold is dissolved in aqua regia, (see *Metallic Substances*, below), and ether added to the solution, the gold will leave the acid and permanently unite with the ether. The exceeding great volatility of ether renders it very easily inflammable even on the approach of flame; and therefore it ought never to be distilled, or even poured from one vessel to another, by candle-light. If a less quantity of the vitriolic acid is added to the spirit of wine than what is sufficient to produce ether, the product is called *Spiritus vitrioli dulcis*.

II. Of the NITROUS ACID and its Combinations.

This acid is far from being so plentiful as the vitriolic. It has been thought to exist in the air; and Dr Priestley's experiments have indeed shewn, that a part of it enters into the composition of our atmosphere: but it is greatly to be doubted whether it can be recovered from it in its proper form; for no method of doing this has hitherto been found. Fixed alkaline salts, indeed, when exposed to the air, imbibe its fixable part, and by that means become susceptible of crystallization; which probably has given occasion to the notion that they imbibe vitriolic acid from it: but we have no experiments from which it can be inferred, either that the least portion of nitrous acid exists ready formed in the air, or that the materials for its formation are to be found there.

What has given rise to the opinion of the nitrous acid being absorbed from the atmosphere, seems to be, that some kinds of earth, the rubbish of old houses, &c. are found impregnated with this acid, on being some time exposed to the air; but we might as well make this an argument for the vitriolic acid being absorbed from the air by pyrites, when exposed to it for making green vitriol. In this last case, however, we know that there is no attraction of new acid; but only a decomposition of sulphur which contains the vitriolic acid already formed, and which then fully manifests itself. In like manner, the nitrous acid may originally lie hid in those earths which are found to contain it plentifully in exposure to the air, and only wants such an exposure to become visible.

The most probable opinion is, that the nitrous acid is only the vitriolic altered by a mixture of inflammable matter; and, in support of this, the similarity between the nitrous and sulphureous vitriolic acids is urged. Experiments are also brought in proof of this; none of them, however, seem to be decisive. In the Berlin memoirs, we have an account of some experiments made by Dr Pictets on this subject; who says, that, having soaked a calcareous stone with vitriolic acid and urine, he found it, after being some time exposed to the air, to abound greatly in nitre. Neuman says, that if two ounces of good spirit of nitre are mixed with half an ounce of oil of turpentine, the

PRACTICE

169

Doubtful whether the nitrous acid is procurable from air, in its proper form.

170

Probably only the vitriolic altered.

168
Properties of ether.

PRACTICE the mixture will be a true balsam of sulphur. The most remarkable experiment, however, is one by Wallerius, mentioned by Dr Lewis in his notes on Neuman's chemistry.

171 Experiment in favour of this opinion. "Some salt of tartar," says he, "being mixed with the dulcified spirit of vitriol, or perhaps with the ether, (for the author expresses himself a little ambiguously,) the full bottle stopp with a cork, tied over with bladder, and laid on its side; on standing for four months, the greatest part of the spirit was found to have escaped, and the salt was shot into hexagonal prismatic crystals resembling nitre. It tasted strongly of the spirit, but had no other particular taste. Laid on a burning coal, it crackled, exploded with a bright flash, and flew into the air. He afterwards found, that by adding to the spirit a drop or two of any acid, the salt crystallizes the sooner; and in this case it has a fourth taste, but in other respects is the same with that made without acid. This salt-petre, says the author, promises, from the violence of its explosion, to make the strongest gun-powder in the world, but a very dear one. Though the experiment should not be applicable to any use in this way, it will probably contribute to illustrate the generation of nitre; as it palpably shows nitre, that is, the acid or characteristic part of nitre, produced from the vitriolic acid and phlogiston."

172 Not conclusive. We cannot here help again regretting that chemists of superior abilities should sometimes leave very important discoveries only half finished, so that chemists of an inferior rank know not what to make of them. Had Wallerius, who seems more than once to have been in possession of this salt, only poured on it a few drops of oil of vitriol, the peculiar colour and smell of the fumes must have been a much more convincing proof of the reality of this transmutation, than that of the mere deflagration; because the latter can be otherwise accounted for.

It is certain, that many substances, water itself not excepted, will explode with great violence if suddenly heated beyond what they are able to bear. If spirit of wine is confined in a close vessel, it will also by means of heat burst it as effectually as water; and as the vapours of this substance are inflammable, the explosion will be attended with a flash, if any flame is near. In like manner, ether, on the approach of a candle, takes fire, and goes off in a flash like lightning; but this happens, not from any thing nitrous, but from its great volatility and inflammability. If therefore the vapours of the ethereal liquor are confined, and heat is applied suddenly to the containing vessel, their great volatility will cause them make an instantaneous effort against the sides of it, which, increasing with a swiftness far beyond that of aqueous or spirituous vapours, will make a much quicker as well as a much stronger explosion than either of them; and if a flaming substance is near, the explosion will be attended with a bright flash like that of the ether itself.

In the experiment now before us, the salt tasted strongly of the spirit, or ether, from which it was made. The spirit was therefore confined in the crystals of salt; and his volatile liquor, which, even under the pressure of the atmosphere, boils with the heat of 100° of Fahrenheit, was, in a confined state, subjected

Vol. III.

to the heat of a burning coal; that is, to more than ten times the degree of heat necessary to convert it into vapour. The consequence of this could be no other, than that the particles of salt, or perhaps the air itself, not being capable of giving way soon enough to the forcible expansion of the ether, a violent explosion would happen, and the salt be thrown about; which accordingly came to pass, and might very reasonably be expected, without any thing nitrous contained in the salt.

The accounts we have of the production of nitre itself, which is a combination of the nitrous acid and fixed alkali, generally agree pretty much in its being extracted from particular kinds of earth, or from the rubbish of old houses; but the impossibility of procuring the least quantity of nitrous salt from these substances in this country, renders the whole of such accounts justly suspected. The warmth of particular climates indeed might be very justly conjectured to be the reason why nitre should be made to advantage in some countries, and not in others; but it can scarce account for the impossibility of making a single grain in colder climates. It seems very strange, that the same means which produce great quantities of nitre in France shall produce none in Britain, though used with the utmost exactness and care.

The requisites for the production of nitre, according to Neuman, are, 1. Putrid, or putrescible matters, either of the animal or vegetable kingdom. 2. Certain earths; as lean clays, limestone, gypsum, the rubbish of old buildings, &c. And, 3. Air. The greatest quantities of salt-petre, says he, are produced from urine and dung, whose strong tendency to putrefaction renders them preferable to other matters. Human urine, the urine of sheep, goats, and horses, and the dung of pigeons, are found to answer best. The leaves, flowers, and stalks of vegetables, hay and straw, saw-dust, &c. are mixed in the composition, and contribute more or less to the effect, according to their degree of putrescibility. On these principles, says he, nitre may be produced in all countries; and in many places very advantageous works might be established, if we were better acquainted with the manner of its production.

According to this author, likewise, certain earths may be so disposed and improved, as to afford more nitre by the admixture of different substances, which may properly be called *nitrous ferments*. The following compositions are proper. 1. Lime, sheeps dung, sheeps urine, and common salt. 2. Lime, salt, rasped horns and hoofs, cuttings of leather, and other refuse of animal substances. 3. Human urine and lime. 4. Human urine, lime, salt, and pigeons dung; and other like mixtures of lime and salt with animal matters. 5. Compositions of animals and vegetables together; as bitter plants boiled in the urine, and poured on the earth. 6. Tartar, lime, and urine. 7. Lime, pressings of grapes, and the liquor of dung-hills. 8. Wine lees, dung-hill liquor, lime, and salt. 9. Tartar and lime. 10. Lime, salt, dung-hill liquor, and the matter remaining after the distillation of spirit of wine. 11. Lime, salt, urine, dung, and martial scoria.

The author of the Chemical Dictionary acquaints us, that this salt is found naturally crystallized in India, nitre.

PRACTICE

173 Accounts of the production of nitre, uncertain and suspicious.

174 Requisites, according to Neuman, for its production.

175 Nitrous ferments.

176 Different methods of making nitre.

PRACTICE dia, and is swept from the earths and stones which produce it; for which reason it is called salt-petre sweepings. A nitre may also be obtained from several plants. These, says he, are the only two kinds of natural nitre; all other nitre is only begun by nature, and is found in the walls of old buildings. The most favourable places for the production of nitre, are the habitations of men and animals, particularly such as are low and moist, as cellars, kitchens, stables, houses of office, and others of that kind, which are apt to be impregnated with vegetable and animal matters, and also to have an habitual moisture, which is favourable to putrefaction; and lastly, which are sheltered from rain, which might dissolve and carry off the nitre as soon as it is formed.

In the East Indies, the nitrous acid is said to be found in great plenty, mixed with some kinds of marly earths; from whence it is extracted by lixiviation with water, and precipitating the earth with a fixed alkali. An account of the method of making salt-petre in Virginia has been published by order of the society for encouraging arts, &c. This, however, gives no light as to the origin of the acid; only informing us that nitre is found in tobacco-houses, stables, cow-houses, hen and pigeon houses, and in any covered place where the influence of the sun seldom reaches. A sixty feet tobacco-house will yield 16 hundred weight yearly; and so in proportion for other houses. The directions for preparing the floors of these houses for yielding nitre, follow.

"In order to prepare the floors for attracting nitre, all dung and other trash must be removed; and if the floors are not level, they must be made so by laying on marl, or any soil not too stiff, which must be lightly trod down with the feet.

"The floor being thus prepared, sprinkle strong amber over it, made from tobacco trash; and cover it with wet ground leaves, or other tobacco trash, for a fortnight: then clean out the trash; and in any cool dry morning that succeeds, you will find on the floor, the nitre attracted and condensed like hoar-frost, which must be carefully swept off as often as that appearance is observed."

In the annual register for 1763, we meet with a paper signed J. R. the author of which relates some attempts of his own to make salt-petre, in so sensible a manner, that we cannot help giving an account of them in his own words.

"Having perused," says he, "what Hoffman, Stahl, Boerhaave, and others, have delivered on the formation of nitre; and being furnished with an account of the nitre-works near Paris, and with the method of making this salt at Calcutta, I entered upon the subject with as much assiduity and attention, as a man can apply to one he is either pleased with, or interested in. The writers above-mentioned differ so little in their accounts of the constitution of nitre, and the materials which supply it, that I shall, for brevity's sake, confine myself to what is delivered by Hoffman. He says, in the first place, that nitre has two principles, or elements; one the universal, simple, and primumogenial acid which inhabits the air, *quod ventris suo portat*; the other an alkaline, sulphureous, fat earth; and that this last is a matrix, which, by attracting to

itself and imbibing the former from the air, constitutes nitre. He further observes, that the substances which supply nitre in greatest plenty, are the rubbish of demolished houses, all kinds of earth, clay, and loam, lime, ashes, and soap-boilers dregs; and that these always produce the most nitre, in proportion as they are combined with the urine and excrements of animals, and with corrupted vegetables. All these materials I soon furnished myself with, and for greater certainty procured some of them from different places; but after frequent trials, by drenching and boiling them in water, could not procure any thing at all like nitre from them. I then provided a great number of flat glazed earthen pans; and in these exposed the same substances for several months, in a dry state, to the air; but found myself equally disappointed. I likewise placed in the same situation a quantity of the vegetable alkaline salt called *pearl-ash*, some of it alone, and some mixed with the fore-mentioned earthy substances; but to no better purpose: for which I am induced to believe, notwithstanding the authority of Hoffman, and the opinion of many concerning the residence of the nitrous acid in the air, that it is not to be found therein; and this I am the better authorized to deliver, as I never could procure, after proper trials, any vestiges of nitre from hail, snow, rain-water, or dew."

These experiments having proved totally fruitless, our author was obliged to have recourse to other sources for the nitrous acid: and the only one he could find was hard spring-water. Many of these waters do indeed contain a combination of the nitrous acid with calcareous earth; but in too small quantity to be worth extracting. The operation is very easy, consisting only in dropping into the water a solution of fixed alkaline salt, filtering the liquor, and evaporating to a sufficient degree; when crystals of true nitre will be formed. From three pounds of such water as we have tried, only 20 grains of nitre were procurable; it is probable, therefore, that in all places where this salt is found in plenty, there are some circumstances which contribute to its formation, that are either over-looked, or designedly concealed.

The distinguishing characteristic of the nitrous acid is its great disposition to unite with the phlogiston; and, when so united, first to become exceedingly volatile, and at last to be dissipated in a very white bright flame: this is called its *detonation* or *deflagration*. In the strongest state in which this acid is procurable in a liquid form, it is of a reddish yellow colour, and continually exhales in dense, red, and very noxious fumes; and in this state is called *smoking*, or, from its inventor, *Glauber's*, spirit of nitre.

To extract the Nitrous Acid by means of the *Vitriolic*.

Into a glass-retort put two pounds of good salt-petre, and pour upon it 18 ounces of concentrated oil of vitriol; set the retort in a sand heat, and lute on a large receiver with the composition recommended n° 78, for resisting acid fumes; the mixture will grow very warm, and the retort and receiver will be filled with red vapours. A small fire is then to be kindled, and cautiously raised till no more drops will fall from the nose of the retort. What comes over will be a very strong and smoking spirit of nitre.

Rectifica-
tion.

In this process, the nitrous acid is generally mixed with part of the vitriolic which comes over along with it, and from which it must be freed if designed for nice purposes. This is most effectually done by distilling in it a small quantity of nitre, and re-distilling the mixture. The vitriolic acid which came over in the first distillation is kept back by the nitre in the second, combining with its alkaline basis, and expelling a proportionable quantity of the nitrons acid.

181
Different
methods of
distilling.

We have here directed the pure vitriolic acid to be used, in order to expel the nitrous one; but for this purpose any combination of the vitriolic acid with a metallic or earthy basis may be used, though not with equal advantage. If calcined vitriol is made use of, as much phlogiston is communicated by the calx of iron contained in that salt, as makes the nitrous acid exceedingly volatile, so that great part of it is lost. If calcined alum, or selenite, is made use of, the vitriolic acid in these substances immediately leaves the earth with which it was combined, in order to unite with the alkaline basis of the nitre, and expels its acid: but the moment the nitrous acid is expelled from the alkali, it combines with the earth which the vitriolic acid had left; from which it cannot be driven without a violent fire; and part of it remains obstinately fixed, so as not to be expelled by any degree of heat. Hence the produce of spirit, when nitre is distilled with such substances, always turns out considerably less than when the pure vitriolic acid is used. Alum is preferable to selenite, for the purposes of distilling spirit of nitre; because the acid does not adhere so strongly to argillaceous, as to calcareous earth.

182
Uses.

Spirit of nitre is very useful in the arts of dyeing and refining, where it is known by the name of *aqua fortis*; and therefore an easy and cheap method of procuring it is a valuable piece of knowledge. Many difficulties, however, occur in this process, as well as that for the vitriolic acid. Oil of vitriol, indeed, always expels the nitrous acid with certainty; and on distilling the mixture, a spirit of nitre arises; but if a glass-retort is used for the purpose of distilling this acid, the quantity of residuum left in distillation is so great, and so insoluble in water, being no other than vitriolated tartar, that the retort must always be broke in order to get it out; and the produce of spirit will scarce afford the expence of breaking a retort. If earthen retorts are made use of, they must certainly be of that kind called stone-ware, and the price of them will be very little if at all inferior to that of glass. Iron pots are said to be made use of in the distillation of common aqua fortis in large quantities; but they have the great inconvenience of making a quantity of the acid so volatile, that it not only will not condense, but spreads its suffocating vapours all around in such a manner as to prove very dangerous to those who are near it. If an iron vessel, therefore, is thought of for the purpose of distilling aqua fortis, it will be proper at least to attempt luting over the inside with a mixture of gypseous earth and sand, to prevent as much as possible the acid from attacking the metal.

183
Blue aqua
fortis.

To procure the Nitrous Acid by means of *Arsenic*.

Pulverise equal quantities of dried nitre and white

crystalline arsenic; mix them well together, and distil in a glass-retort with a fire very cautiously applied; for the arsenic acts on the nitre with such violence, and the fumes are here so volatile, that, unless great care is taken, a most dangerous explosion will almost certainly happen. As, in this case, the nitrous fumes arise in a perfectly dry state, some water must be put into the receiver, with which they may unite and condense. The aqua fortis so produced will have a blue colour, owing to the inflammable principle separated from the arsenic, by which its extreme volatility is likewise occasioned. If this blue aqua fortis is exposed to the air, its colour soon flies off.

Nitrous Acid combined with *Alkaline Salts*.

184

1. *Vegetable fixed alkali*. This salt, combined with the nitrous acid to the point of saturation, regenerates nitre. It is observable, however, according to Neuman, that there is always some dissimilarity between the original, and regenerated nitre, unless quicklime is added. The regenerated salt, he says, always corrodes tin, which the original nitre does not. Boiling with quicklime deprives it of this quality, and makes it exactly the same with original nitre.

Salt-petre.

185

2. *Fossil alkali*. The neutral salt arising from a combination of the nitrous acid and fossil alkali is somewhat different from common nitre; being more difficult to crystallize, inclining to deliquesce in the air, and shooting into crystals of a cubical form, whence it gets the name of *cubic nitre*. Its qualities are found somewhat inferior to the common nitre; and therefore it is never made, unless by accident, or for experiments.

Cubic nitre.

186

Nitre is one of the most fusible salts. It is liquefied in a heat much less than what is necessary to make it red; and thus remain in tranquil fusion, without swelling. If nitre thus melted be left to cool and fix, whether it has been made red hot or not in the fusion, it coagulates into a white, semi-transparent, solid mass, called *mineral crystal*, having all the properties of nitre itself. By this fusion, Mr Beaumé observes that nitre loses very little, if any, of the water contained in its crystals, since the weight of mineral crystal is nearly the same with that of the nitre employed.

Fusibility.

When nitre is kept in fusion with a moderate heat, and at the same time does not touch any inflammable matter, nor even flame, it remains in that state without suffering any very sensible alteration; but if it is long kept in fusion with a strong fire, part of the acid is destroyed by the phlogiston which penetrates the crucible; and hence the nitre becomes more and more alkaline. (See n° 220.)

187

Nitre is of very extensive use in different arts; being the principal ingredient in gun-powder; and serving as an excellent flux to other matters; whence its use in glass making. (See GLASS.) It is also possessed of a considerable antiseptic power; whence its use in preserving meat, to which it communicates a red colour. In medicine, nitre is used as a diuretic, sedative, and cooler; but very often fits uneasily on the stomach. The resemblance of the crystals of nitre to those of Glauber's salt has sometimes been the occasion of dangerous mistakes. Dr Alexander mentions a swelling over the whole body of a woman, occasioned

Uses.

PRACTICE by her taking a solution of nitre instead of Glauber's salt. Two mistakes of the same kind we have also known. In one an ounce, and in the other upwards of two ounces, of nitre, were swallowed. The symptoms occasioned were universal coldness and shivering, extreme debility and sickness at stomach, cold sweats, and faintings. Neither of the cases proved mortal. The cure was effected by cordials and corroborants.

188
Sal prunella.

A process has obtained a place in the dispensatories for a supposed purification of nitre, by means of flowers of brimstone. A pound of salt-petre is to be melted in a crucible, or small iron vessel; and an ounce of flowers of sulphur thrown upon it, by small quantities at a time: a violent deflagration ensues on each addition; and after the whole is put in, the salt is poured out in moulds, and then called *sal prunella*. It has been disputed whether the nitre was at all depurated by this process; Dr Lewis thinks it is not. From our own experience, however, we can affirm, that by this means a sediment falls to the bottom, which carries with it any impurities that may have been in the nitre, and leaves the fluid salt clear and transparent as water. This precipitate is probably no other than a vitriolated tartar formed by the union of the sulphurous acid and alkali of the nitre, which being less fusible than the nitre, subsides in a solid form and clarifies it.

189
Nitrous ammoniac.

3. *Volatile alkali*. The nitrous acid seems peculiarly adapted to an union with volatile alkali; saturating as much, or rather more of it than the strongest vitriolic acid is capable of doing. The product is a very beautiful salt, called *volatile nitre*, or *nitrous sal ammoniac*. It very readily dissolves, not only in water, but in spirit of wine, which distinguishes it from the vitriolic, and common kind of sal ammoniac. It also requires less heat for its sublimation: indeed care must be taken not to apply too great a heat for this purpose, as the nitrous sal ammoniac has the property of deflagrating by itself without any addition of inflammable matter; and this it does more or less readily, as the volatile alkali with which it was made was more or less impure and oily.

190
Dr Ward's white drop.

The medical virtues of this kind of nitre have not been inquired into. It seems to have made the principal ingredient in the famous Dr Ward's white drop, which was celebrated as an antiscorbutic; with what justice, those who have tried it must determine. The first step towards the preparation of this medicine, was the distillation of a spirit of nitre from equal parts of nitre and green vitriol calcined to whiteness by a very gentle heat. The product, we know, must have been an aqua fortis of a quality nowise extraordinary. To sixteen ounces of this aqua fortis rectified, seven ounces of volatile sal ammoniac are to be added. The quantity of volatile alkali is insufficient to saturate so much acid; but, as far as it goes, will form nitrous sal ammoniac. To the acid, thus partly saturated, four ounces of quicksilver is to be added, of which it is to be allowed to dissolve as much as it can. The liquor now contains a solution of nitrous sal ammoniac, and of quicksilver. It is then to be evaporated to a pellicle; and as the nitrous sal ammoniac must be in greater quantity than the mercurial salt, it will at any rate crystallize first. Mr Beaumé has shown

that the crystals of one kind of salt contain none of any other, though they are both dissolved in the same liquid. The salt produced could therefore contain no mercury, except what adhered to the outside of its crystals; and this was rendered as little as possible, by carefully draining the *corrosive oil* (as it is called in the receipt) from them. The nitrous sal ammoniac now rendered almost pure, is to be dissolved in thrice its quantity of rose-water: and this solution is the famous *white drop*; a most excellent, and perhaps the greatest, antiscorbutic and purifier of the blood, (*Annual Register* for 1763). The dose of this powerful medicine was two drops in the 24 hours. Two drops of any liquid weigh about a grain. A fourth part of this, or a quarter of a grain, was nitrous sal ammoniac impregnated with an uncertain, but inconceivably little portion of mercury dissolved in the nitrous acid; and we agree with the chemist who signed the receipt, that, if proper care was taken to drain the salt, such a medicine was not dangerous.

Nitrous Acid combined with Earths.

1. *Calcareous*. The nitrous acid dissolves into a transparent colourless liquor; but for this purpose it must be very much diluted, or the solution will have a gelatinous consistence. This compound is not applicable to any useful purpose. It has a very acrid taste; and, if inspissated, attracts moisture from the air. If it is totally dried, it then resembles an earthy matter, which deflagrates very weakly. By distillation in a retort, almost all the acid may be expelled, and what little remains flies off in an open fire.

Mr Pott, who has particularly examined the combination of nitrous acid with quicklime, says that the acid suffered remarkable alterations by distillation from quicklime, and repeated combinations upon it. By these experiments he obtained a salt more sensibly susceptible of crystallization and detonation, than what can be obtained by a single combination. From his experiments it would seem, that nitrous acid, by this treatment with quicklime, was capable of being entirely decomposed.

If a solution of chalk in the nitrous acid be evaporated to dryness, and then gently calcined, it acquires the property of shining in the dark, after having been exposed to the sun's rays, or even to the light of a candle. This substance, from its inventor, is called *Baldwin's phosphorus*; or, from its being necessary to keep it in a glass hermetically sealed, *phosphorus hermeticus*. (See EARTHS.)

2. *Argillaceous earths and magnesia*.—All that is known concerning the combinations of nitrous acid with these earths is, that the first produce astringent, and the second purgative, compounds, similar to alum and Epsom salt, and which are not susceptible of crystallization.

Nitrous Acid combined with Metallic Substances.

1. *Gold*.—Till very lately, it has been the opinion of chemists, that the nitrous acid by itself was incapable of acting upon this metal.—Dr Brandt, however, produced before the Swedish academy of sciences, a solution of gold in the nitrous acid, obtained in parting, by that acid, a mixture of gold and silver.—The

PRACTICE

191

Calcareous nitre.

192

Nitrous acid decomposed.

193

Phosphorus.

194

Gold.

The mixed metal was boiled with aqua fortis, in a glass body fitted with a head and receiver, the liquor poured off, and the coction repeated with fresh parcels of stronger and stronger nitrous spirits, till all the silver was judged to be extracted. The last parcel was boiled down till the matter at the bottom looked like a dry salt; on boiling this in fresh aqua fortis in close vessels, as before, a part of the gold was dissolved, and the liquor tinged yellow. But though gold is by this means truly soluble in the nitrous acid, the union is extremely slight; the gold being not only precipitated on the addition of silver, but likewise spontaneously on exposure to the air.—Dr Lewis very justly observes, that this solution may have been often made unknown to the chemists who did so; and probably occasioned the mistakes which some have fallen into, who thought that they were in possession of aqua fortis capable of transmuting silver into gold.

195
Silver.

2. *Silver*.—Pure spirit of nitre will dissolve its own weight of silver; and shoots with it into fine white crystals of a triangular form, consisting of very thin plates joined closely one upon another. These crystals are somewhat deliquescent; of an extremely bitter, pungent, and nauseous taste; and, if taken internally, are highly corrosive and poisonous. They melt in a small heat; and form, on cooling, a dark-coloured mass still more corrosive, called *lunar caustic* or *lapis infernalis*. They readily dissolve in water; and, by the assistance of warmth, in spirit of wine. In the *Actæ Nature Curiosorum*, tom. vi. there is a remarkable history of silver being volatilized by its combination with the nitrous acid. Four ounces of silver being dissolved in aqua fortis, and the solution set to distil in an earthen retort, a white transparent butter arose into the neck, and nothing remaining behind; by degrees the butter liquefied, and passed down into the phlegm in the receiver. The whole being now poured back into the retort, the silver arose again along with the acid. The volatilization being attributed to the liquor having stood in a laboratory where charcoal was bringing in, the experiment was repeated with a fresh solution of silver, and a little powdered charcoal, with the same event.

197
Colours produced by solution of silver.

Solution of silver in the nitrous acid stains hair, bones, and other solid parts of animals, and different kinds of wood, of all the intermediate shades from a light brown to a deep and lasting black. The liquors commonly sold for staining hair brown or black, are no other than solutions of silver in aqua fortis, so far diluted in water as not sensibly to corrode the hair.

It gives a permanent stain likewise to sundry stones; not only to those of the softer kind, as marble; but to some of considerable hardness, as agates and jaspers. The solution for this purpose should be fully saturated with the metal; and the stone, after the liquor has been applied, exposed for some time to the sun. M. du Fay observes, (in a paper on this subject in the French memoirs for 1728), that if the solution be repeatedly applied, it will penetrate in the whitish agate, or chalcedony, about one-twelfth of an inch; that the tincture does not prove uniform, on account of the veins in the stone; that the colours, thus communicated by art, are readily distinguishable from the natural, by disappearing on laying the stone for a

night in aqua fortis; that, on exposing it to the sun afterwards for some days, the colour returns: that the solution gave somewhat different tinctures to different stones; to oriental agate, a deeper black than to the common chalcedony; to an agate spotted with yellow, a purple; to the jade stone, a pale brownish; to the common emerald, an opake black; to common granate, a violet unequally deep; to serpentine stone, an olive; to marble, a reddish, which changed to purple, and fixed in a brown; that on slates, talcs, and amianthus, it had no effect.

198

If solution of silver be diluted with pure water, a considerable quantity of pure mercury added, and the whole set by in a cold place; there will form by degrees a precipitation and crystallization resembling a little tree, with its root, trunk, and branches, called *arbor Dianæ* or the *philosophic silver tree*. Another kind of artificial vegetation may be produced by spreading a few drops of solution of silver upon a glass plate, and placing in the middle a small bit of any of the metals that precipitate silver, particularly iron. The silver quickly concretes into curious ramifications all over the plate.

199
Solution of silver decomposed.

Like other metallic solutions, this combination of the nitrous acid with silver is decomposed by fixed and volatile alkalies, calcareous earths, and several metals, (see the *Table of Affinities*); but with several peculiar circumstances attending the precipitation. With metals, the silver is readily and copiously thrown down at first, but slowly and difficultly towards the end. The menstruum generally retains some portion of the silver, as the silver almost always does of the metal which precipitated it. For recovering the silver from aqua fortis after parting, the refiners employ copper. The solution, diluted with water, is put into a copper vessel, or into a glass one with thin plates of copper, and set in a gentle warmth. The silver begins immediately to separate from the liquor in form of fine grey scales, or powder; a part of the copper being dissolved in its place, so as to tinge the fluid more or less of a bluish green colour. The plates are now and then shaken, that such part of the silver as is deposited upon them may fall off, and settle to the bottom. The digestion is continued till a fresh bright plate, kept for some time in the warm liquor, is no longer observed to contract any powdery matter on the surface; when the liquor is poured off, and the precipitate washed with fresh parcels of boiling water. It is observable, that though the acid in this process saturates itself with the copper, in proportion as it lets go the silver, yet the quantity of copper which it takes up is not near so great as that of the silver which it deposits. One drachm of copper will precipitate three of silver, and saturate all the acid that held the three drachms dissolved.

Calcareous earths, as chalk, or quicklime, throw down a part of the silver, but leave a very considerable part suspended in the liquor. If the earth be moistened with the solution into the consistence of a paste, and exposed to the sun, it changes its white colour to a dark purplish black; distinct characters may be exhibited on the matter, by intercepting a part of the sun's light by threads, slit paper, &c. placed on the outside of the glass. Culinary fire does not af-

fect

fect its colour; after the masfs have been exsiccated by this, it changes as before, on exposure to the sun.

Mild volatile alkaline spirits, added to a solution of silver precipitate, but little, and caustic volatile alkalies, none. Pure fixed alkalies, and alkalies rendered caustic by quicklime, throw down the whole. Fixed alkalies impregnated with inflammable matter by calcination with animal coals, occasion at first a considerable precipitation; but, if added to a larger quantity, take up great part of the metal again. Mr Margraff relates, that edulcorated calces of silver totally dissolve, both in a lixivium of these alkalies, and in volatile spirits; and that the marine acid precipitates the silver from the volatile, but not from the fixed, alkaline solution. Kunckel reports, that the calx precipitated by volatile spirits made with quicklime, fulminates or explodes in the fire; and that by insipidating a solution of pure silver, melting the dry residuum, pouring it on spirit of urine supersaturated with salt, and setting the mixture in a gentle warmth, a blood-red masf is produced, so tough as to admit of being wound about the fingers.

200
Copper.

3. *Copper*. The nitrous acid very readily dissolves this metal into a green-coloured and very caustic liquor. The solution, if properly evaporated, will crystallize; but the crystals are deliquescent, and therefore difficult to be preserved. The only use of this combination is for the preparation of the pigment called *verditer*. Of this there are two kinds, the blue and green. The blue is by far the brightest colour, and consequently the most valuable. It is said that this is obtained by precipitating a solution of copper by any calcareous earth; and therefore is sold by the refiners, who have large quantities of solution of copper accidentally made. The solution is said to be precipitated by chalk, or whiting; and that the precipitate is the beautiful blue colour called *verditer*.

201
Verditer.

Though this process has obtained so much credit as to be printed, and implicitly copied from one book into another, it is certain that nothing can be more false. We have dissolved copper in the nitrous, the vitriolic, the marine, and the vegetable, acids. These solutions we have precipitated with fixed alkalies, with volatile alkalies, with absorbent earths, without being able to produce any other colour than the dirty green *verditer*. We have combined the precipitates with different blues, rubbing them long with Prussian blue, with smalt, bice, &c. in different proportions, without producing the desired colour. Of these, smalt mixed with green *verditer* was found to come nearest to the colour of blue *verditer*. We have also dissolved copper in alkalies, both fixed and volatile; precipitating the solutions with acids, and endeavouring to combine them, when precipitated, with a small quantity of fixed alkali; but with no success. Blue *verditer* itself dissolves in the nitrous acid with a strong effervescence; and if precipitated from it by a fixed alkali, a volatile alkali, or an absorbent earth, is always changed into green *verditer*. This last, when pure, always dissolves without effervescence, and is precipitated unchanged.

Dr Merrit likewise takes notice of the fallacy of the receipts given for making *verditer*; and seems inclined to believe that silver is necessary to its formation, as

this colour is prepared only by the refiners; but in whatever proportion we combined solution of copper with silver, we never could produce the desired colour.

4. *Iron*. On this metal the concentrated nitrous acid acts very violently; and plentifully corrodes, but does not dissolve it; the calx falling almost as fast as dissolved; and when it is once left fall, fresh acid will not take it up again. If the acid was diluted at first, it takes up a considerable proportion, provided the metal be leisurely added. If the solution is performed with extreme slowness, the colour will be green; but, if otherwise, of a dark red. It does not crystallize; and, if insipidated to dryness, deliquesces in the air.

203
Tin.

5. *Tin*. Concentrated nitrous acid acts upon tin with great force, but only corrodes the metal into a white indissoluble masf: in order to obtain a perfect solution of tin in the nitrous acid, the metal must be put in by very little at a time, and a diluted aqua fortis made use of. This solution has been considerably used in dyeing, and is remarkable for heightening red colours of all kinds; but the solution made with aqua regis is preferable. See TIN, Sect. III.

204
Lead.

6. *Lead*. Proof aqua fortis, lowered with an equal quantity of water, dissolves about half its weight of lead. On diluting the solution with a large quantity of water, it turns milky, and deposits great part of the metal. The solution shoots, upon exhaling part of the menstruum, into small pyramidal crystals with square bases, of an austere sweet taste.

In the memoirs of the French academy for 1733, there is a particular account of an experiment, in which mercury is said to have been extracted from lead by dissolving it in the nitrous acid. During the dissolution, there fell a precipitate, which is plainly proved to be mercury, and was looked upon to be one of the constituent parts of the lead separated by this simple process: it seems probable, however, that the mercury in this case had been contained in the aqua fortis; for pure lead dissolved in pure aqua fortis gives no such precipitate.

205
Quicksilver supposed to be extracted from lead.

The crystals of lead in the nitrous acid, when thrown into the fire, do not degenerate as other combinations of this acid with metallic or saline bases; but crackle violently, and fly around, with great danger to the by-standers. If they are rubbed into very fine powder, they may then be melted without any danger. By repeated dissolutions in fresh aqua fortis, they at last form a thick fluid like oil, which cannot be dried without great difficulty. This composition is not adapted to any particular use, and is a violent poison.

7. *Quicksilver*. Aqua fortis, of such a degree of strength as to take up half its weight of silver, dissolves with ease above equal its weight of mercury into a limpid liquor, intensely corrosive and poisonous, which spontaneously shoots into white crystals. These crystals, or the solution exsiccated, and moderately calcined, assume a sparkling red colour; and are used in medicine as an escharotic, under the name of red *red precipitate*. This precipitate has sometimes been given internally, it is said, in very large quantities; even a whole drachm at one dose. But this would seem incredible; and the present practice does not countenance

206
Quicksilver.207
Red precipitate.

PRACTICE

countenance the taking of red precipitate inwardly. This solution seems to have been what gave the efficacy to Ward's white drop. See n° 190.

When red precipitate is prepared in quantity, it is proper to distil the mercurial solution; because most of the aqua fortis may then be saved. It is exceedingly pure, if by purity we mean its being free of any admixture of vitriolic or marine acids; but is considerably tainted with the inflammable principle of the mercury extricated during the dissolution. In consequence of this, it is very volatile and smoking; which has generally, though improperly, been taken as a sign of strength in the nitrous acid.

208
Bismuth.

8. *Bismuth*. This semimetal is very readily acted upon by the nitrous acid. Proof aqua fortis dissolves about half its weight of bismuth. If the metal was hastily added, the solution proves of a greenish colour; if otherwife, it is colourless and transparent. Unless the acid was diluted with about an equal quantity of water, a part of the bismuth crystallizes almost as fast as it dissolves. The metal is totally precipitated both by fixed and volatile alkalis. The last, added in greater quantities than are sufficient for precipitation, take it up again. The liquor generally appears greenish; by alternate additions of the alkaline spirit and solution, it becomes bluish, or purple. Fixed alkalis calcined with inflammable matter, likewise dissolve the bismuth after they have precipitated it.

209
Magistery
of bismuth.

The only use of this compound is for the precipitate, which is used as a cosmetic, under the name of *magistery of bismuth*. The common way of preparing this is by diluting the solution very largely with water, upon which it turns milky, and a fine white precipitate falls, which is to be well educorated with water, and is then employed as a cosmetic, both in washes and pomatums.

Concerning the preparation of this cosmetic, Neuman observes, that there are sundry variations.—“Some” says he, “take aqua regia for the menstruum; and for the precipitant a solution of sea-salt, alkalies, spirit of wine, &c. Some mix, with the solution of bismuth, a solution of benzoin in spirit of wine, and thus obtain a magistery compounded of bismuth and benzoin. Others add a solution of chalk to the metalline solution, and precipitate both together by alkalis. I have made trial with a good number of different precipitants; and found, that with common fixed alkali and caustic alkali, with watery and vinous alkaline spirits, the magistery was white, and in considerable quantity; the liquor, after the precipitation with volatile spirits, appearing blue. That oil of vitriol threw down a white precipitate very copiously: but that with spirit of salt, or spirit of vitriol, the precipitate was in very small quantity, in colour like the foregoing; distilled vinegar making no precipitation at all. Common rectified spirit of wine, and tartarized spirit, common water, and lime-water, gave white precipitates. Solutions of nitre, vitriolated tartar, sal mirabile, alum, borax, common salt, sal ammoniac, the combination of marine acid with calcareous earth, and terra solata tartari, all precipitated the bismuth white. With a solution of gold in aqua regia the magistery proved grey; with a solution of the same me-

tal in aqua regia made with spirit of salt, the precipitate was likewise grey, and in small quantity; with solution of copper in aqua fortis, white, and in very small quantity, the liquor continuing blue; with solution of vitriol of copper, white; with solution of mercury sublimata, white and plentiful; with solution of iron in aqua fortis, yellowish; with solution of lead in aqua fortis, and of sugar of lead, white; with solution of zinc in aqua fortis, there was little precipitate; and with solutions of silver, tin, regulus of antimony, and of mercury, in the same acid, none at all.”

210
Zinc.

9. *Zinc*.—Upon this semimetal, the nitrous acid acts with greater violence than any other, and will forsake any other metallic substance for it. The whole is very soon dissolved into a transparent colourless liquor. The calces or flowers of zinc, (See ZINC, Sect. III.) are likewise soluble in the nitrous acid; but neither the solution of the flowers, nor of the metal itself, has been yet found applicable to any useful purpose. Neuman remarks, that on extracting with nitrous acid the soluble parts of calamine, which is an ore of zinc, the solution, inspissated to dryness, left a reddish brown mass, which, on digestion with spirit of wine, exploded, and burst the vessel.

211
Regulus of
antimony.

10. *Regulus of Antimony*. The nitrous acid rather corrodes, than dissolves, this semimetal. The corroded powder forms a medicine formerly used under the name of *bezoar mineral*, but now disregarded. See ANTIMONY, Sect. III.

212
Regulus of
cobalt.

11. *Regulus of Cobalt*. This semimetal dissolves readily in the nitrous acid, both in its metallic form, and when reduced to a calx. The solution is of a red colour. Hence the nitrous acid furnishes means of discovering this semimetal in ores, after strong calcination; very few other calces being soluble in the nitrous acid; and those that are, not influencing the colour.

213
Regulus of
cobalt, how
discovered
in ores.

12. *Nickel*. This semimetal is easily dissolved by the nitrous acid into a deep green liquor; but neither this solution, nor indeed the semimetal of which it is made, has hitherto been found of any use.

13. *Arsenic*. This substance is readily dissolved by the nitrous acid, but the nature of the compound is not known.

Nitrous Acid combined with Inflammable Substances.

214
Oils.

1. *Expressed oils*. These, as well as all other fatty or unctuous substances, are considerably thickened and hardened by their union with the nitrous acid. There is only one preparation where this combination is applied to any use. It is the *unguentum citrinum* of the slops. This is made by adding to some quantity of melted hog's-lard, a solution of quicksilver in the nitrous acid. The acid, though in a diluted state, and combined with mercury, nevertheless acts with such force on the lard, as to render the ointment almost of the consistence of tallow.

215
Unguentum
citrinum.

2. *Vinous spirits*. If highly rectified spirit of wine and strong spirit of nitre are suddenly mixed together, the acid instantly becomes volatile, and is dissipated with great heat and effervescence, in highly noxious red fumes. If the acid is cautiously poured into the spirit, in the proportion of five, six, or even ten parts of spirit to one of acid, and the mixture distilled in a glass-

216
Spirit of
wine.

217
Spiritus ni-
tri dulcis.218
Nitrous e-
ther.

glass-retort set in a water-bath, an exceedingly fragrant and volatile spirit comes over, used in medicine as a diuretic and cooler, under the name of *spiritus nitri dulcis*. This liquor is not acid; nor has what remains in the retort any more the characteristics of nitrous acid, which seems to be entirely decomposed in this process. (See the following article.)

With the nitrous acid and spirit of wine, may also be made an exceedingly volatile liquor, called *nitrous ether*, to distinguish it from the vitriolic, mentioned n° 167. The method of preparing this ether is very simple and easy, provided due precautions are observed. The best proportions of the acid and vinous spirit, are, two ounces of strong nitrous acid, and three of good rectified spirit of wine. The acid is first put into a vial; and nearly an equal bulk of water is very slowly added, that it may float as much as possible on the spirit of nitre. The spirit of wine is then to be added in the same slow and cautious manner, that it may float as much as possible on the water. The whole is placed in a vessel of cold water, and the vial not very closely stoppered. The acid gradually rises up through the water, and mingles with the spirit of wine; a gentle ebullition happens during the union, and the elastic fluid generated gets out by the stopper of the bottle. The ether is produced in full quantity in seven or eight days, and floats on the top of the mixture, from whence it is to be poured off, and rectified by distillation with a little fixed alkali.

Nitrous Acid decomposed by Phlogiston.

Oils fired
by spirit of
nitre.

1. *Essential oils*. If equal quantities of strong nitrous acid and oil of cloves are poured into the same vessel, the mixture instantly takes fire; both acid and oil burning with great fury till only a light spongy coal remains. Dr Lewis observes, that this experiment does not always succeed, and that there are but few oils which can be fired with certainty, without attending to a particular circumstance first discovered by M. Rouelle, and communicated in the French memoirs for the year 1747. "On letting fall into the oil equal its quantity of acid, the mixture effervesces, swells, and a light fungous coal arises: a little more of the acid poured upon this coal sets it instantly on fire: by this method almost all the distilled oils may be fired by spirit of nitre of moderate strength. Exprefsed oils also may be set on fire by a mixture of the nitrous acid and oil of vitriol; the use of which last seems to be to absorb the aqueous humidity of the nitrous, and bring it to a greater degree of concentration than it can be brought to by itself."

Nitre alkali-
fied.

2. *Charcoal*. By this substance, the nitrous acid cannot be conveniently decomposed, unless it is combined with an alkaline or metallic base. For the purpose of decomposing the acid, common salt-petre is most convenient. The proportions recommended by Dr Lewis for alkalinizing nitre, are four ounces of the salt, to five drachms of powdered charcoal. If these are carefully mixed, and injected by little and little into a tubulated retort made red hot, and fitted with a large receiver and a number of adopters, a violent deflagration will ensue on every addition, attended with a great quantity of air, and some vapours which will circulate for some time, and then condense in the

vessels. These vapours, when condensed, seem rather of an alkaline than acid nature. This liquor is called *clivus of nitre*. If sulphur is used instead of nitre, the *clivus* is of a different kind, consisting of a mixture of the nitrous and vitriolic acids. The residuum, when charcoal is used, is a very strong and pure alkali; with sulphur, it is vitriolated tartar.

3. *Vinous spirits*. In the process already mentioned for making *spiritus nitri dulcis*, a total decomposition of the acid seems to take place; for neither the dulcified spirit itself, nor the acid matter left in the retort, shew any signs of deflagration with inflammable matters, which is the peculiar characteristic of nitrous acid.

Mr Pott has given an analysis of the oleaginous residuum of the distillation. Distilled by a stronger fire, it gave over a yellow, acid, slightly empyreumatic spirit; which being saturated with fixed alkali, the liquor evaporated, and the dry neutral salt laid on burning coals did not deflagrate. After this spirit arose a red empyreumatic oil; and in the bottom of the retort was left a shining black mass like foot; which, burnt in a crucible, left a white, fixed, earth, convertible, by a vehement fire, into glass. Another parcel of the above residuum was evaporated to the consistence of pitch. In this state it gave a yellow tincture to spirit of wine, flamed vividly and quietly on burning coals, and at last swelled up like bitumens. Another portion was saturated with alkaline ley, with which it immediately effervesced, and then evaporated as the former. It gave, as before, a yellow colour to rectified spirit of wine, and a much deeper yellow to dulcified spirit of nitre; and in the fire discovered no footstep of detonation. Mr Macquer supposes this acid to have been not the nitrous, but the acetous, which enters into the composition of the spirit of wine; but it is impossible to account for the total disappearance of the spirit of nitre, unless on the supposition of its decomposition.

III. Of the MARINE ACID and its Combinations.

This acid is never, at least very rarely found, but in a state of saturation with the mineral alkali; in which case it forms the common salt used in food. Almost the only exception to this is human urine, and perhaps that of some other animals; for there the marine acid is found saturated, not with the mineral, but the common vegetable fixed alkali. From being found in such plenty in the waters of the ocean, it has the name of *marine acid*.

It is commonly thought that this acid is no other than the vitriolic, somehow or other disguised by the inflammable principle; to which some have added another, called by them a *mercurial earth*.

The reasons given for this supposition, however, are but very slight, consisting chiefly in the resemblance between the volatile vitriolic acid and the marine, both in the white colour of their vapours, and likewise the great volatility of both. As to the existence of that principle called a mercurial earth, it hath never been proved; and, till that time, can never be allowed to be an ingredient in the composition of any substance whatever. As we do not remember to have read of any experiments where the marine acid was directly

thought to
be the same
with the vi-
triolic.

directly produced from that of vitriol, we shall content ourselves with relating one very remarkable fact, which happened to fall under our own observation.

As vitriolated tartar, or Glauber's salt, when fused with charcoal-dust, is converted into an hepar sulphuris, attempts have been made on this principle to separate the pure alkali from the residuum of Glauber's spirit of nitre and spirit of salt. In an attempt of this kind, which, by the bye, proved unsuccessful, as all others of the same kind must do, 30 or 40 pounds of the mafs for Glauber's salt were fused in a strong iron pot, with a sufficient quantity of common coal powdered and sifted. As the quantity of powdered coals was pretty large, the mafs was thereby hindered from flowing into thin fusion; and, that the whole might be perfectly alkalinized, it was frequently stirred up with an iron ladle, and kept very intensely heated for some hours. The mafs was now taken out by means of an iron ladle, and laid on a flat stone; and, as it was but half fluid, every ladleful congealed into a black irregular saline mafs, which had the appearance of a cinder; but which, however, consisted of an hepar sulphuris mixed with some coal-dust. As there was a considerable quantity of this matter, and the ladlefuls were thrown at random above one another, it so happened, that between two or three of the pieces, a kind of chimney was formed, so that there being a small draught of air through the interstices, and the masses containing a quantity of coal-dust, the internal parts were in a state of ignition, while the external were quite cold. From these ignited places, a white fume arose; which, being collected on the colder masses, assumed the form of white flowers. These were found to be genuine sal ammoniac, composed of volatile alkali, and marine acid; both of which, we have the greatest reason to think, were produced at that very time, and that a double transmutation took place; namely, of the vitriolic acid into the marine, and of the fixed alkali into the volatile. Our reasons for being of this opinion are, 1. That the matter had been subjected to such an extreme and long continued heat, that, had any sal ammoniac been pre-existent in the mixture, it must have certainly been dissipated, as this salt always sublimes with a degree of heat below ignition. 2. Though the matter was taken out of the pot of a very intense red heat, so that the saline part was evidently melted, yet no ammoniacal fume issued from it at that time, nor till the masses had been for some time exposed to the air, and were become cool, excepting only those interstices where the air kept up a burning heat, by a small draught being formed from the situation of the saline masses. 3. In those ignited places, when cool, the fixed salt was entirely decomposed, neither alkaline salt, Glauber's salt, fixed alkali, nor sulphur remaining; but the whole was consumed to a kind of ferruginous ashes. We are therefore of opinion, that the marine acid and volatile alkali are, in some cases, mere creatures of the fire, and most commonly produced at the same time, from the slow combustion of mineral substances. Hence, where heaps of hot cinders are thrown out, small quantities of the true sal ammoniac are always formed, when the ignited ones

happen to fall in such a manner as to occasion a small draught of air through them. PRACTICE

The marine acid, or spirit of salt, is weaker than either the vitriolic or nitrous; though Dr Priestley hath observed, that, when concentrated to the utmost degree, in which state it was perfectly invisible and elastic as air, it was then able to separate the nitrous acid from an alkali. In some other cases, too, it appears not only stronger than the nitrous, but even than the vitriolic, of which we shall take notice in course.

To procure the Marine Acid by means of the *Vitriolic*.
